No. 1.

A PHOTOGRAPHER'S VISIT TO PETRA.

WITH AN INTRODUCTION, BY THOMAS W. LUDLOW.

OWING to the difficulty of the journey and the inhospitable and treacherous disposition of the natives, graphically described by our Philadelphia Photographer, few Europeans and Americans have undertaken with success of late years to visit Petra, the Rock City of Seir; hence an air of mystery hangs over the place and adds not a little to its attraction.*

Petra is identified with the Hebrew Selah, "a rock," † the Amorite, Edomite, and Moabite stronghold (Judges, i, 36; 2 Kings, xiv, 7; Isaiah, xvi, 1). Diodorus Siculus (xix, 94-98) speaks of the varied fortunes of the two expeditions sent against the place by Antigonos, whose general, Athenaios, was very roughly handled by the sturdy Nabathæans, while his son, Demetrios Poliorketes, was content later to lead his army back from their wild country without having gained any appreciable advantage. Strabo (Geog. xvi, 663, v. 15, ed. Didot) tells us of Petra as a city shut in by rocks in the midst of the desert, yet supplied abundantly with water, and important as a place of transit for Oriental productions. Pliny, too (Hist. Nat. vi, 32, 3), identifies the site by a definite description. The town was deprived

of what independence remained to it by the Romans under A. Cornelius Palma in the time of Trajan, at the dawn of the second century A. D. There is evidence that it received some of Hadrian's widespread bounty, and that it was still in Roman hands in the day of Septimius Severus, a century later. It figures from the fourth to the sixth century in the annals of the Christian Church; but from the time of the Council of Jerusalem in A. D. 536, in which the Bishop of Petra, Theodorus, took part, until its discovery by the distinguished traveler, Burckhardt, in 1812, the old city drops entirely out of sight. The busy mart must have been destroyed by some incursion of the wild nomads of the desert.

It is not necessary to anticipate Mr. Wilson's picturesque description of the site of Petra beneath the venerable Mount Hor of the Bible, ‡ and of the scenes, strange to Western eyes, through which the traveler passes to get there. The city lay in a narrow valley, surrounded by precipitous hills. On the eastern and western sides the cliffs rise almost perpendicular to the height of six or seven hundred feet. On the north and south the natural barriers

* The artist Gérôme gained entrance with a party of his countrymen, about 1870. An interesting and amusing sketch of their experiences has been published by one of their number—"Le Fayoum, le Sinaï et Pétra." Par Paul Lenoir. Paris, 1872. The American artist, Mr. F. E. Church, visited Petra in 1868, and made a number of oil studies there, from which he painted his picture of the Khuzneh. Mr. Wilson furnishes the following list of English and American travelers, besides himself, who have visited Petra with parties since 1860:—

W. H. Bartlett, about 1861; Dean Stanley, 1862; Rev. Henry Formby, about 1862; Professor E. H. Palmer, about 1870; Dr. James Strong, 1874; Miss Sophie M. Palmer. 1882; Lieutenant Conder succeeded in getting in, it is believed, in 1883.

† This slight sketch of the history of Petra, and the remarks that follow upon the present condition of the site, are based particularly upon the valuable article upon Petra by the Rev. James Strong, D. D., in the Cyclopædia of Biblical, Theological, and Ecclesiastical Literature, by the Rev. Drs. M'Climock and Strong (Harpers, 1867-1881).

The map is from surveys made by Dr. Strong and Mr. Ward in 1874, and is engraved from the original draught. It is of peculiar interest as being, it is believed, the only one from original surveys since that of Laborde published in 1830 (Voyage de l'Arabie Pétrée. Par Léon de Laborde et Linant. Paris, 1830).

‡ Numbers, xx: 21, 22; xxxiii: 37.

are less formidable, and may in places be passed by camels. Many recesses, or small lateral valleys, open into the main valley. The circuit of the entire depression, including these lateral valleys, is about four miles.

The central portions of the valley, especially on the banks of the little river, are strewn with numerous remains of ancient buildings, which were constructed of masonry in the ordinary manner. With one or two exceptions, little survives of these but shapeless ruins. There are traces of paved streets, fragments of columns and pedestals, and rock-cut foundations in the greatest plenty. These last occupy not only the bed of the plain, but surrounding eminences, and mark especially private dwellings, which, as was usual in antiquity, appear to have been of slight and comparatively rough construction. The chief existing memorials of the Roman domination, besides a few funeral inscriptions, are the theater hewn from the rock, and the great building known as the Kasr Pharoun, still inclosed by its

stately walls, with a noble arched entrance and an impressive colonnade. These monuments may probably be referred to the time of Hadrian.

But the chief attraction of Petra to the modern student lies in the rock-cut façades, chambers and stairways with which the cliff circuit of the city is almost surrounded, and which occupy the sides of the lateral valleys and other rock faces wherever accessible. Many of these façades, preceding one or more plain, rectangular chambers, with or without roughly hewn interior columns and niches or recesses, are very rich and elaborate. The most elaborate are as late as Hadrian's day, or later. There is hardly room for doubt that all these rock-hewn chambers were designed as tombs, after the fashion practiced by the Phœnicians, who in turn probably adopted the custom from the peoples of Asia Minor, to whom are due such remarkable creations as the necropoleis of Lycian Myra and of Phrygian cliffs—all traceable, perhaps, to the mysterious Hittite heritage.*

* Many facts and details are noticeable which point to more or less complete Phœnician influence at Petra. Without insisting upon this line of inquiry, it may be mentioned that the Petræan system of rock tombs with ornate fronts is thoroughly Phœnician, and not dissimilar in general character to that exemplified in such

Phœnician necropoleis as Amrith. A parallel to the pseudo-classical architectural treatment of Petræan tombs is found at Nea Paphos in Cyprus, where the burial chambers surround courts with rude Doric colonnades cut in the rock. There are examples at Petra of a chiseled ornament in the form of flights of

JEBEL HAROUN—MOUNT HOR.

However, although cut from the rock for sepulchres, these Petrean monuments may well have served later the ends of the living as temples or as dwellings. An inscription in the so-called Deir, one of the very scanty inscribed memorials remaining of old Petra, seems to indicate that this edifice was at one time dedicated to the god Mithras; and it is certain from surviving signs that many of the chief cliff chambers were consecrated as Christian churches.

The most noteworthy of the rock façades of Petra are late in date, florid in their pseudo-Roman* style, and more lavish and extravagant than pure in design. Yet their effect is most surpris-

3. UNFINISHED TEMPLE.

trast with the rugged rock which frames them, and with the vast and weird expanse of desert through which the visitor must pass for days before reaching Petra. Mr. Wilson's contagious enthusiasm for this unparalleled jewel casket of antiquity is thus amply justified.†

NARRATIVE OF THE VISIT TO PETRA.

ing. This is due to many causes, not a little to the wonderful natural coloring of the soft sandstone from which they are chiseled, ranging, as it does, from pure saffron-yellow through the most brilliant red, purple, and blue, with their gradations, and relieved by plain black and white. The elaborate architectural forms, too, are in the most striking con-

THERE are two moldering cities of past ages, widely different from each other, and each, in its own peculiar way, unlike any other—Venice, the queenly city of lagoons and bridges, and Petra, the city of stupendous natural fortifications and rock-hewn architecture. With the Queen of the Adriatic the world is familiar; but only a few travelers have seen Petra, and these have vouchsafed us but little information concerning it. I had dreamed amid the dimmed glories of Venice; I had longed to enter the portals of Petra, the fallen capital of the old Naba-

steps rising and descending. This ornament was derived from the Assyrian form of battlements, and is clearly of Assyrian origin. It is common on Phœnician monuments, as on the Amrith rock tombs, and on many minor antiquities (*cf.* Perrot et Chipiez: *Histoire de l'Art dans l'Antiquité*, III., p. 131.) Again, the slowly tapering pyramidal funeral steles referred to by Mr. Wilson and by other travelers, are Phœnician.

* It may be said of the Khuzneh, even from the point of view of the severe critic, that it is not without much grace and elegance, despite its lavishness. It is the most Roman of the Petrean rock edifices—Roman in the style of a Pompeian wall-painting.

† We regret not to have had access to Hittorff's recent "*Mémoire sur Pompéi et Pétra*" (Paris, 1876).

ANCIENT EDOM, AND THE CLEFT OF PETRA.

RUINS OF A VILLAGE.

thæans, and of Trajan's province of Arabia Petræa.

The site of Petra lies half way between the Gulf of Akabah and the Dead Sea, about seventy miles as the vulture flies, from each. Its wonderful ruins are continually guarded by a tribe of Bedouin Arabs, who live in the village of Eljy, two miles north-east. They keep careful watch, because they believe that somewhere in the old town great treasures are hidden, and that it is the object of every white traveler who visits Petra to discover and carry away the riches of antiquity. All who have left record of their visit to Petra tell of the difficulties encountered with these suspicious Bedouins. Many a would-be visitor has been driven back from the very gates, robbed and insulted, without so much as a bird's-eye view of Petra to compensate him for ten days of hard desert travel.

When, on the Nile, I revealed my design to see Petra, various dragomen and tourists declared that it was "impossible to enter the place," and that "no white person had done so for over eight years." This did not shake my determination to make the effort, at least, to "take Petra." I might be driven back disappointed. I might succeed in securing the material and the information I coveted. So, at Cairo I made my preparations to carry out

plans formed before I left my Philadelphia home.

The first step was to secure a dragoman. I knew of only one with whom I felt willing to risk my life. He had guided through the desert General George B. McClellan, Dr. Charles S. Robinson, Professor Charles M. Mead and Dr. Henry Clay Trumbull, the author of "Kadesh Barnea." He had been spoken of by Mr. Charles Dudley Warner in his "In the Levant" in such terms as to confirm my desire to secure him. His name, Mohammed Achmed Effendi Hedayah, indicated, among other things, that he was a good Mussulman, "an educated man," as he put it, of good social standing, able to read and write, and of partly Moorish extraction. Never shall I forget our first consultation. The difficulties and dangers of what I proposed were mapped out for me with true Arabic eloquence. Seeing that I did not shrink, my new-made acquaintance then depicted the horrors which those who had made the attempt to get into Petra were obliged to undergo. He failed to move me from my determination. "Then," said he, pushing his red tarboush nervously back upon his head and rolling his eyes up toward heaven, "I see you are an old traveler and an educated gentleman and I will go with you. I am an educated man; I have been twenty-five years a dragoman; I have been three times to Petra; no white man has been there for eight years. I know Salim the Sheikh of Petra; once he

Four months of companionship with the worthy Achmed taught me that none too much had been said in his praise. He knew his business exactly. He proved truthful, trustworthy, generous, manly, and brave. I have seen him rush at a fellow who was pointing his musket at him, wrench the weapon away and fling it on the stones at his feet. I have seen him hasten with a long stride peculiarly his own into the midst of a fight between our attendants, jerk their swords away and send the combatants sprawling upon the ground. I have seen him, when we were surrounded, kneel first upon the sand and commit the gentlemen to the keeping of Allah, and then go out with his life in his hand to meet insult and injury in our behalf. I have seen him too, when we had all been taken prisoners, act with the greatest forbearance and wisdom, knowing full well that our safety depended upon his patience. He understood stooping to conquer. Achmed was as bright as any Yankee, as politic as a Pennsylvania Congressman. He was seldom at a loss even under the most trying circumstances. A hint that the accomplishment of any task would add to his fame always secured his best efforts, which would be supplemented by the request: "Please mention in your book that Hedayah Effendi's address is No. 8 Silk Bazar, Alexandria." Mounted on his camel, Achmed

THE FIRST GLIMPSE OF THE KHUZNEH.

THE KHUZNEH.

Hedayah was even noble looking—nor did his character belie his appearance. Side by side, on camel, on horse, and on foot, we traveled for four months, happy and free.

On the appointed day we set out for Petra, pondering over the scanty details the books could give us of a city which once received the caravans of Arabia, India, and Persia, and sent their rich stores on to Egypt, Syria, Palestine, and Greece,—a city whose king, during the last melancholy tragedies of Jewish independence, marched out at the head of fifty thousand men, entered Jerusalem, and besieged the Temple until commanded by Rome to desist.* Our curiosity was aroused by the image of a historic site which had been lost to civilization for nearly a thousand years,

and by anticipations of its unique edifices. There was just enough peril about our enterprise to make it enchanting. My companions were Messrs. William H. Rau, Douglass P. Birnie, and William B. Ogden, all Americans. Our route was by rail from Cairo to Suez; across the Red Sea a few miles south of Suez; down the desert to Mount Sinai; thence north and east to the head of the Gulf of Akabah.

It has been said that there is but one entrance to Petra. Yet there is a “back door,” so to speak, through which some travelers have made their way into the city, and by means of which they have also more suddenly made their departure. The real approach is through a narrow gorge some two miles long, of which the gateway faces the east. This is reached from

* King Aretas of the Nabathæans, who connived with Antipater and Hyrkanos to overthrow Aristobulus II., King of the Jews. See Dr. Smith's New Testament History, page 65.—EDITOR.

TEMPLE OF THE URN AND ARCHED TERRACE.

Palestine by way of Moab, east of the Dead Sea, and from the south by the route which I took.

The back door may be gained from north or south by way of the Wady Arabah—the vast desert waste which lies between the Gulf of Akabah and the Dead Sea, into which it opens near the base of venerable Mount Hor. Visitors who enter thus may perhaps escape a contest with the Bedouins, but they lose the most imposing and startling scenery, that of the approach through the Gorge of the Sik, as well as the most satisfactory first impressions of the ruins. They see the town from the back; they enter the grand theater from behind the scenes, and regret their lack of courage all their lives.

At Akabah opposition might be met and the whole project fail. There Sheikh Ibn-jad, or Ben-jad, of the Haiwaytat tribe, lives. Only by his consent could we hope to see Petra.

My heart sank when I looked into the grim chief's yellow, dissembling face, and saw the scornful smile which came over it as I made known my desires through my dragoman. After much argument, conducted in the true Arabic fashion, I was informed that in one week I could be supplied with dromedaries and men, who would take my party to Petra, provided no visitation of Providence intervened. I had no disposition to remain a week where the Mecca pilgrims had left a true Egyptian plague of fleas and flies; and I replied to Ben-jad that unless our departure could be made in two days, we would go back to Suez. This disturbed him somewhat, and he expressed sorrow that we showed him so little respect as to desire to leave his territory so soon. I did not relent. Of course, the Sheikh's true reasoning was that the longer we

remained in Akabah the more he would get of the money that we must have with us.

The Tawara Arabs who had brought us from Suez, and whom tribal law forbade to conduct us into the country of another tribe, had returned to their homes. Yet I assured Ben-jad that rather than remain in Akabah a week we would walk back to Suez. For a time it looked very much as if I should have to carry out my threat, so obdurate was the Sheikh. With my companions I retired to the beach to form our plans—just as Solomon used to sit by the sea and watch the coming of his vessels from Ophir,—leaving Ben-jad, on his side, an opportunity for reflection. In about an hour I went back to our camp to see if there was any show of weakness on the part of the Arabs. The scene was indescribable. Our tents had been taken down; our luggage was spread on the ground in confusion; camels and men enough to accommodate three parties such as ours had made their appearance mysteriously; and the Bedouins were pulling about our boxes of stores and photographic paraphernalia, and quarreling over them, all anxious now to join our caravan, since the Sheikh had decided we could make our departure at once.

I placed our new friends in a quandary again by mounting one of our large provision boxes, and shouting to them at the top of my voice to remove our property at once from their camels and to get out of my sight. Chaos ceased for a time, and further consultation was had. I refused to allow the camels to be loaded until I knew who was to be our conducting Sheikh and who the camel-drivers, and until a contract satisfactory to my dragoman had been signed, sealed, and delivered. After several hours of argument, during which the Egyptian scribe stationed at the fort at Akabah had written, altered, and destroyed several contracts, one satisfactory to both sides was agreed upon. Like all such documents, the first part was made up of salutations and compliments, while the last lines consisted of compliments and salutations. The business in it was added as a postscript. Exactions were made for castle fees, for a useless guard of soldiers during our three nights at Abakah, for camels, camel-drivers, a conducting Sheikh, water at five dollars per barrel, for barley for the horse of the Sheikh, a present for his newest wife, an entrance fee, or "blackmail," for each white person in our party, and a special tax for our Nubian servant Abdullah, "because he was a foreigner and black!"

The route over which it was agreed to conduct us was the one I preferred and one but rarely taken, that by way of the "long desert"

which runs east of the Wady Arabah through a magnificent mountain range known as Mount Seir. On March 21, 1882, leaving Akabah and passing between the sites of ancient Eloth and Ezion-Geber, we traversed the Wady Arabah for about two hours, and then entered the mouth of Wady el Ithm. Then we advanced eastward until the mountain caravan route was reached, when we turned north again. Most uninviting to us were these desert highways. Though always lined with mountains whose forms are picturesque, they are bleak, and barren of all that holds life. The most striking feature of the way is its wildness, so complete that the road is almost indistinguishable from the wilderness through which it passes. Yet we were upon a route over which for over four thousand years caravans between Eloth and Edom had traveled.

From day to day, as we plodded northward, we came to narrow tracts of soil which had evidently been cultivated. Once, in a cave, I found a rude plow, such as I had seen in use at Egyptian Heliopolis. Two or three times we saw small oases. At Humeiyumeh there is a subterranean well, with stone-cut steps leading down to its mouth. From this, our camel-drivers drew water in vessels of goat skin and poured it into basins hewn in the stony floor of the desert to water their beasts.

Now came a great desert expanse with only an occasional upheaval of sandstone to break its monotony. The Rock of El-Guerrah in this expanse is a most singular formation. There is no other elevation within several miles of it. It seems like a rocky island in the sea, bearing upon its summit an old fortress, about which our attendants could tell us nothing. Each day now we reached a higher elevation. On the third morning we seemed to be in a vast amphitheater, three sides of which were surrounded by magnificent peaks of strangely varied forms and colors. Red, brown, yellow, blue, purple, gray, and marl green were the prevailing tints, running in diagonal streaks and strata as amazing as they were beautiful. All the expectations aroused by descriptions I had read of wondrous coloring among the mountains of Edom were surpassed. Here amid all this beauty a fight arose among our camel-drivers, in which our conducting Sheikh became involved. Quick as a flash are these

Arabs! Their striped abbahs were thrown upon the ground; cutlasses, swords, and blunderbusses — a display more curious than that in any pawnbroker's window — were drawn, and the battle began right and left, a hand to hand and wordy conflict. Not much blood was drawn. There never is in an Arab fight. About the time one looks for casualties, each combatant is seized by the lookers-on and saved from certain death. Then the Sheikh appears and declares that "it is a shame to be seen fighting before Christians," and that he "would rather lose his beard than look upon such a sight again."

That same night I took measures with Hedayah to execute a scheme partly planned in Cairo. It was to send a scout ahead, to reach

THE AMPHITHEATER.

Petra if possible some thirty-six hours before we could. If there was danger on the way, he was to return quickly and warn us. His capture we need not fear, for we would try to send a man who was *sahib* (friendly) to the natives. If he reported no danger, we were to proceed within a mile or two of Eljy, the Bedouin village near Petra, and then, leaving the caravan road, rough it across the country and try to get into Petra unseen and unheard. Among our attendants secured at Akabah was a giant Nubian. He had great scars down each cheek, and a row of upper tusks which might have driven me away from him with fear, had they not been balanced by a merry twinkle which came continually from his great, staring black eyes. To him about midnight was given our commission. His instructions were to "run" as do the post-boys in Nubia,

BEDOUINS IN THE KHUZNEH GORGE.

TEMPLE OF THE URN—EASTERN COLONNADE.

and to reach Eljy early the next afternoon. Money was given him to buy sheep, with which he was to regale and cajole the good and watchful people of Eljy. Onions and tobacco were supplied him also for distribution to any one who might give him trouble.

Our envoy was to make the most of the news of the war with Arabi Pasha, then brewing, and to exert every effort in his power to create such an excitement in the town that all the fellahin in the neighborhood would get word and flock in to see and hear him. Thus the coast would be made clear for us when it was time to sneak by. As we traveled along the Mount Seir spur, he could see us at least a day before we could him, and if there was danger he was to signal us when we approached. If all was safe he was to go on with the good work and not trouble himself about us, until we had passed. Shaking his brawny hand, I assured him of my confidence, bade him good-bye, and he departed. I then lay down to dream of the fable of the "Fox and the Turkeys."

On the fourth day, at the moment of a sun-

set of which the splendor was in harmony with the strange grandeur of the surrounding scenery, a shower drove us into a *nawami* or rock-house. We were now nearing Petra, and could make out the majestic peaks of Mount Hor two days' journey beyond.

On Saturday, March 25, the fifth day from Akabah, we rose at four o'clock. We ate a hasty breakfast by the light of our camp-fire of turfa-bushes, and began the travel of the day. We were within eight hours of Petra. If we arrived by sunrise undisturbed at the summit of a mountain spur just before us, we should catch a glimpse of Wady Mousa—the valley in which Petra lies. A sharp frost had visited us, and the tiny stream near our camp was frozen over. Command was given that no one should speak loudly, and scouts were sent ahead to guard against surprise or attack. Our hearts throbbed with excitement. I felt as when, in other days, I crept cautiously along in the night with my regiment, rifle in hand, suspecting every rock and stone, and expecting each moment to meet the foe.

CORINTHIAN STRUCTURE.

Our caravan was halted. Gathered close to our brave dragoman our quartette proceeded to gain the highest point ahead. What should we meet beyond? A hard scramble for an hour or more over a flinty road, brought us to this point. The scene which lay before us I shall never forget. The rising sun barely tipped the higher peaks with crimson glow. The shadows among the hills were still thick and long and wide, and I seemed to be looking down from a balloon upon a wonderful panorama. As the sun rose, a great, yawning chasm was seen splitting in twain the mountain range far below us, and creeping away to the West—a grim black scar. It was the Wady Mousa! Within its gloomy shade, as yet untouched by the morning sun, lay Petra—the climax of Edom, the Idumæan capital. My heart leaped, and in imagination I saw ruined cities looming up before me, more and more clearly defined each moment.

Beyond the western termination of the gorge a fine stretch of the Wady Arabah began to appear in light; and behind its westerly ranges, now also touched by the glories of the sunshine, were the hills about Hebron and the Dead Sea, and those bordering the Mediterranean close to Gaza. The coloring became more and more splendid, changing each moment in intensity as the light grew. There in the gloom of the valley was a long, zigzag line, winding like a river. It moved. Once in a while a bit of light would touch it, and then it would drop into the shadow again. From right to left it swayed at the will of its leader; then all at once it rose high in air as though to greet the God of Day, and the

mystery was explained. It was an immense flock of storks, awakened to new life by the genial sun.

The golden hill-domes were growing brighter and brighter, and were flushed with pink, like the blush on a peach. The great rock upheavals seemed like the billows of the sea. There was as yet no sign of our Nubian scout El Wafi. Had our scheme been a success? Or had he met a horrible fate which we soon must share?

Near noon we came to a spring called 'Ain Daluga, where we halted for lunch. The great cleft of Wady Mousa was hidden from view; but for miles we could look back over the flinty path we had been climbing for six or seven hours. At our feet was a magnificent valley, along the grassy bottom of which we could see a winding stream lined with strips of land under cultivation. Suddenly we heard shouting, then the crash of fire-arms. Each moment we expected to hear the thud of Bedouin bullets against the rocks. There was no time to lose. Our camels were quickly arranged side by side to form a barricade. We speedily got behind them and awaited events. We seemed to thirst for Bedouin blood—for the blood of Esau's children. But no enemy approached. It was probably only the festival which El Wafi had been sent to organize. After all we had not been seen. With grateful hearts we quietly slunk down toward the Gorge of the Sik, or Wady Mousa. The great shadow had disappeared now, and the sun shone fairly into the gorge, giving fine effect to the blood-red of its walls, and bringing out strongly the lines of neighboring peaks. At the Western Gate, pyramid-like, stands a great rock-sentinel grim and defiant. It seemed to bar our escape in front from a Bedouin pursuit.

Fearing to approach the town of Eljy too closely,—we were only two miles south of it,—we left the now descending roadway and crossed some cultivated fields, coming, at the foot of the descent, into a thick jungle of oleander bushes. Through this runs the noisy little river, the Sik. In a moment more we had crossed it, and stood in Wady Mousa, unseen, unheard, unopposed!

Breaking our way through the jungle on the farther side of the stream, we found ourselves in the very heart of the Necropolis of Petra. A group of tombs on our right tapering toward the top reminded us of some of those in the Valley of Jehoshaphat, or again, of the obelisk pedestals of Egypt. A little farther on, on the left, is a double structure of construction hard to understand. Though not a very beautiful ruin, it is a well-preserved specimen of Petran architecture. The lower

story displays a range of Ionic columns which lend to it an air of Greece, while the upper tier of the façade is adorned with a series of pyramid-shaped members suggestive of Egypt. This variety, singular in antiquity, may be at-

the ornate fronts are but caves squared by the old stone-cutter, and are lighted only by their doors. While the bases and beetling sides of these mountains are fashioned into architectural forms that are as enduring as the eternal

TEMPLE WITH THREE TIERS OF COLUMNS.

tributed to the fancy of the antique nabobs who caused its building — men who borrowed their ideas from the foreign lands with which they had dealings. Each story of the façade marks a curious interior. The upper one has a large recess cut in the rear wall with smaller ones on either side, and graves cut in them all. The lower interior is supplied on three of its sides with a continuous stone bench. In the rear, away up toward the ceiling, are two *loculi*, or recesses for sarcophagi.

It may be useful to remind the reader, before we enter Petra proper, that all its principal structures, be they tombs, palaces, or temples, are excavated from the rock, and not constructed of quarried stone. Very rarely are ornaments of these "monolithic edifices" found detached, and still more rarely in antiquity were blocks inserted or let into any of the rock-hewn architecture of Petra. The sides of the mountains, which form a natural amphitheater of nearly four miles in circumference and with walls from five hundred to six hundred feet high, are cut to smooth perpendicular faces, which are occupied by unbroken ranges of temples and of homes for the living and the dead. The interiors behind

hills from which they are hewn, the picturesque summits above display Nature in her wildest and most savage garb.

Continuing our advance, we followed the stream a few rods, and descending as the pass narrowed, the entrance of the frightful chasm, seen afar off at sunrise, was reached at last. What an impregnable gateway! Spanning it is a fine buttressed arch, resting upon rock-cut foundations. Beneath this a little stream gurgles. We followed it through the only entrance — the "front door" of Petra. Still undiscovered we had passed under the great portal now, whether triumphal arch as poetry calls it, or simple aqueduct — the latter the more probable interpretation in view of the similar bridges found higher up among the mountain clefts.

The top of the northern wall of the defile was once inhabited. Excavations, bridges, terraced gardens, and various other evidences remain upon it of the industry and artistic taste of a wonderfully persevering people. The grotto at Posilippo opened to the sky could not present the grandeur of this approach. It is difficult to conceive anything more sublime.

ROCK STAIRWAY AND PULPIT.

meeting, they overhang to such a degree that the sky is shut out from the sight for a hundred yards at a stretch. On every side, more than a yard above the stream-bed, channels are cut in the rock as conduits for water, and in some places terra-cotta pipes are found cemented in these channels. Tiny niches abound also, cut in the sides of the gorge. In these indications remain of figures — old Pagan divinities, no doubt. The growth of oleanders becomes more dense as the gorge descends. Green caper plants dangle from the crevices, and here and there a graceful tamarisk is found in the shade. The tiny brook, the Sik, follows the whole way. The quarried stone scattered along the path indicates that the floor of the fissure was once paved.

We scraped away the débris to the depth of nearly two feet, and reached the antique pavement. It was found deeply furrowed by the tires of the chariot wheels, which once coursed along this cavernous highway — as deeply cut as are some of the lava pavements of resurrected Pompeii.

At every turn we saw evidences of indefatigable effort, and of how lavishly labor was

expended by the people who lived in Petra in its days of power. All seemed the work of some giant magician's wand. The defile, indeed, is called Wady Mousa by the Arabs because they believe that the patriarch Moses, by one stroke of his staff, caused the mountain to separate and to form this tremendous fissure in order to enable him to pass on to Mount Hor, accompanying Aaron, to help him die and to lay him at rest. For nearly two miles we followed this semi-subterranean passage. The pathway now descended; the water grew deeper, the opposing thickets more impassable, the scene more grand. A last struggle was made, a sudden turn in the gorge was passed; and as I looked skyward, through the rocky vista I caught the first glimpse of that remarkable creation — *The Khuzneh!* Only partly seen at first, beyond the tall, narrow opening, carved in stone of a pale rose color, were columns, capitals, and cornices, as new-looking as if of yesterday. With what subtle judgment was the site chosen! But when and by whom, no one knows — mysterious history conceals.

Each advancing footstep developed a bewitching and bewildering change of scene. The first sight revealed only the lower portion of a single column. A stumble over a bit of pavement, and a section of the front from base to pediment was disclosed. Another turn in the gorge hid all but a portion of the pediment from view. All this laboriously finished work formed a wondrous contrast with the rugged rock which framed the view. In a moment, the approach is more than ever obstructed by luxuriant oleanders. Only by climbing up to the top of a rock can even the urn be seen — seeming then to be floating unsustained in the air. The brilliant noonday sun streams through the gorge south of the Khuzneh. It was to secure this magnificent display that we accepted the hardship and risk of the "long desert" route. I had read about this first glimpse of the Khuzneh; I had seen engravings of it made after hasty sketches; yet I found it to surpass the most romantic ideal I had formed of its loveliness. At the time we could not but think our dragoman was right when he said: "See Rome, see Egypt, see Greece, see Baalbec and Palmyra, but above all, see the Khuzneh!"

Emerging from the gorge into an open area, we stood face to face with the strange edifice. To account for such a structure in such a place is as difficult as to tell the history of the gem from which was shaped the intaglio you wear upon your finger. How the work was done is not such a mystery, for on either side remain holes cut in the cliff to receive the scaffolding.

The Khuzneh is in a wonderful state of preservation, but the figures which once graced it, of which the nature can now be only guessed at, are too much defaced for recognition. Time did not do all the damage. For most of it the destructive hand of man is answerable. The portico, consisting now of five columns, one of the original six having fallen, with capitals of Corinthian style, supports an entablature with

a delicately proportioned pediment. The columns I judged to be about forty feet high. Measuring a fragment of the broken one lying near, I found their diameter was three feet. Between the outer pair of columns on either side there has been an equestrian figure. Vases connected by garlands of flowers adorn the entablature, and in the center of the pediment is carved a crouching eagle. Eagles are at the corners also, and over the doors. The superstructure is almost equal in height to the lower story. It consists of a small circular construction, reminding the fanciful beholder of the "Lantern of Diogenes" at Athens. It, too, is supported by Corinthian pillars, and is surmounted by a huge urn, and a smaller edicule of the same order stands on either side. Every part is richly sculptured. The façade I measured and found to be ninety-six feet wide. I estimated the height to be the same. The color is a

THE PYRAMID — SHIEK SALIM AND HIS STAFF.

INTERIOR OF TEMPLE WITH FLUTED COLUMNS.

delicate rose-pink, like that of the buildings further on in the city, almost unbroken by waves of other hue.

The steps to the portico are much defaced and are overgrown with grass. Beneath the portico are two chambers, each about eight by twenty feet in size, with niches at the back. Over each is a circular window partly walled up. The chief interior chamber of the Khuzneh is forty feet square, twenty feet high, and receives all its light from the door. The doorway is seven feet wide and richly decorated.

The Arabs call it "El Khasneh,"—The Treasure,—as they imagine that the great crowning urn contains wealth which will one day be divinely revealed to them.

After a thorough examination of the "Treasure" from near at hand, I clambered up a cliff opposite, whence I could view the whole at my leisure. I experienced a feeling of satisfied contentment and admiration. Scarcely had I chosen for myself a comfortable seat among the rocks, when I heard a great crashing noise in the gorge beyond, as though an earthquake had sent great masses of stone down to prevent our exit. The sound came nearer and nearer, booming and bounding through the gorge as I have heard the terrible wind-gusts come leaping over the snow when climbing our own Mt. Washington in winter. But it was no convulsion of nature this time. Now, voices were heard; then, closer, most demoniacal yells, and the unmistakable clash of hoofs. Our worst fears were to be realized.

The Bedouins were upon us! "Oh! El Wafi; traitor after all!"

"Don't be afraid, gentlemen," said our dragoman, quietly. "If they attempt to trouble us, it will be only to rob us of our money and our clothing. Our bodies will not be harmed."

With this assurance I scrambled down to the mouth of the gorge, arriving just in time to see rush furiously towards me six mounted Arabs of wily mien, with long-reaching lances on their shoulders. I stood to await their arrival. They were as surprised to see me as I was to see them, and now they halted. I cried out "Sahib" and offered my hand. To my surprise it was taken good-naturedly by all the party, and a declaration of friendliness passed between us. We were in their city, and now they were bound to protect us (and rob us!) they declared. The lances were planted in the ground while the subject was discussed. They had not seen *us*, but as our caravan was compelled to take the public road, it was discovered, and from our men the fact was learned that a party of travelers had gone ahead. Instantly they put spurs to their horses and came clashing through the gorge hoping to prevent our entrance; but they were an hour too late. Like good Mohammedans they accepted "God's will" in the matter, leaped from their horses, and insisted that we should take their places. We did so, and thus were led triumphantly into Petra by the very men who would have prevented our entrance amid exactions and bluster, had they caught us at the necropolis. The El Wafi scheme had worked, and the good-hearted Nubian came in with our cavalcade two hours after, his eyes looking larger, his breath smelling stronger of garlic, and his grin far broader than ever before.

Sheikh Salim, the chief of the tribe, was absent when we arrived. His son headed the party who took possession of us. Salim had heard of some very fat sheep and attractive dromedaries belonging to a nomadic tribe, who had brought them to graze a few miles away, and had gone with a posse of his retainers to raid a portion of this desirable property. He returned that night a richer man; but what were a few sheep and camels in comparison with the gold which awaited him in the purses of the howadji, even then in Petra? At once he came thundering through the gorge and was with us at break of day.

Then another scheme had to be perfected. As a rule, when travelers get into Petra at all, they are hurried out again as rapidly as possible, seldom remaining a full day. I wanted to stay long enough to get at least a tolerable photographic record of the ruins. I must meet the chief with his own weapons. He would

THE ALTAR OF BAAL.

make objection to my further stay in Petra. I would object to making my departure. He would then attempt to levy upon my purse, and I would discuss the subject with him, agree to some of his propositions, pay on account, and ask until next day to consider the rest. Thus I might prolong my visit. The plan worked, but for four days only. I began to realize then that if we remained any longer we should be literally cleaned out, and perhaps killed by the Bedouins.

But to return to our early experiences.

As the inner gate of the city beyond the Khuzneh was entered, to the right and left wondrous architectural fancies loomed up. On the left is a group of square-cut edifices, seeming at first like gigantic steps, but out of which varied façades appear upon a closer view. Away in the distance, low down, amid surrounding cliffs, a glimpse of the theater is had — almost as impressive as the first surprising sight of the Khuzneh. On the right is a trio of tombs and temples hewn from the end of a range of cliffs, the last one looking like

THE DEIR (OR CONVENT) AND STAIRWAY.

a great, grim warder at the city gate. Beneath are numberless excavations, each one of which, from its appearance, might have been used first as a home for the living, before being appropriated as a tomb. Opposite this group, on the left bank of the Sik, is the theater. Its auditorium forms about three-fourths of a circle, is one hundred and twenty feet in diameter, and has thirty-three tiers of seats, each capable of holding a hundred people. The "private boxes" for royalty and for the guests of the city are back of the upper row. It is hewn wholly from the rock. A grand view is that from the western side. In the dis-

tance is the gorge of the Khuzneh. The highest peak on the right is one that will be visited presently. Thence, no doubt, the citadel once frowned. About the theater fragments of the rich columns which once ornamented it can still be seen, partly covered by invading soil. So perfectly preserved, too, is the monument in all essential features, that if the tenants of the graves opposite could rise once more into life, they could readily find their old seats.

Now, emerging into the expanse of the little valley, the full glory of the Edomite capital burst upon us. Nature built these stupendous walls, and man adorned them with patient workmanship, each artist vying with his fellow in shaping these rainbow cliffs into forms of beauty.

In a bird's-eye view of Petra, one portion of the town, corresponding almost to a modern "block," is particularly prominent. More than a dozen splendid structures are here side by side, so that it is hard to select from them any one for illustration. One of the most striking is the so-called Temple of the Urn and Arched Terrace. Both Egyptian and

NEIGHBORHOOD OF THE TEMPLE OF THE URN (IN THE MIDDLE-GROUND).

Roman art influence are apparent in this broad façade. To obtain a good color and relief from monotony, the architect cut into the rock some fifteen feet and placed a row of columns on either side to form a portico. An arched terrace is employed to support the platform, of which the base is quite a hundred feet above the valley level. There are two tiers of terrace arches. The lower is nearly buried beneath the débris of other arches. Behind them

are several chambers cut out of the mountain underneath the façade. Originally five columns supported the gallery on each side. Four lofty pilasters adorn the façade, and there is not only a window immediately above the doorway, but a row of three other windows between the pilasters, a few feet below the capitals. These suggest the possible existence of upper chambers. Surmounting the pediment is a great urn, like others of its class a

constant aim for the bullets of the Bedouins, who try thus feebly to bring it down because they believe it to contain "great treasure." The colors of the stone are remarkable, and in the sunshine bright and beautiful. The material, sandstone, is so soft that the effect is like that of pastel. When the torrents come the water is absorbed by the rock. As the water percolates, the rock is colored by iron deposits, and thus a great variety of vivid hues is created. The arches of this temple are grayish brown; the front as far as the capitals is streaked with golden yellow and pink; up to the urn the pediment is white and red, lilac and blue.

The manner in which the colors occur, in stripes and waves, is illustrated by a study of the eastern colonnade. Through it the broken entrance to the dark interior is seen. There is but one wide and lofty chamber, fifty feet square. An inscription on the wall declares that it was once consecrated as a Christian church. At the rear there are three recesses. All these are so well preserved that they still show the marks of the chisel. The flocks seem to have made it their home once upon a time, but now the bats hold full sway.

The Corinthian structure near by, being more exposed to the elements, is not in so good repair. Twelve fine columns ornament its façade, and eight more of smaller dimensions surmount these. There are four entrances, which gave the architect opportunity not only to gratify his taste for lavish decoration, but to give variety in the construction of the pediments. Of these two are arched and two are triangular. Reaching quite across the front, between the architrave and the base of the pediment, is a strange frieze resembling a row of Corinthian capitals. I judged the height of this front to be about equal to that of the Khuzneh,—close to one hundred feet. The interior is divided into four chambers, all in front, with niches in the walls here and there.

Still more grand is the "Temple with the Three Tiers of Columns," which has four entrances and is four stories high. The builder fell short of his material of living rock on the left hand, and helped out the design with quarried stone. Earthquake has sent all these built-up portions tumbling to the ground, but a grand ruin remains. Its lower interior (I believe there are chambers in the upper stories, too, which I was not allowed to visit) comprises several apartments. In the walls are niches for images. The color display here again is most fantastic.

From the front of the Temple of Columns one can look to the right and left upon what once formed the principal quarter of Petra. On all sides it is encompassed by precipitous

mountains, whose spurs sometimes encroach upon the area, with natural walls from four to twelve hundred feet high.

Not so fascinating were certain excavations back of our tents. News spreads like wild-fire in modern Edom; and before we first saw the sunset beyond Mount Hor some sixty of Esau's descendants had followed us and had opened offices in these excavations. Never was so savage a haunt for banditti conceived by Salvator Rosa. The trouble then began. Each individual Arab claimed the privilege of showing the city to the stranger. From their bluster I made up my mind that we were soon to be cut into pieces in order that the work might be done more expeditiously. During those four dreadful days I obtained more satisfactory studies of Hades, Purgatory, Sheol, and Gehenna than I had previously flattered myself I should secure in this world. A viler band of robbers never existed. I had fallen voluntarily into their hands, and it behooved me now to make the best bargain I could to get away. But just here was the trouble. No bargain agreed upon was adhered to for an hour at a time. Some item was always "forgotten." At each amendment of the contract an amount of discussion had to be undergone that was exasperating beyond measure. The only compensation I had was that these discussions secured me more time in the town. Between arguments I snatched the coveted views with my three cameras. Frequent settlements were had in my tent, with Salim, and they were always dramatic. After the money was counted out in English sovereigns and Egyptian "dollars," it was separated into various sums and spread out upon the rug. Then Salim would take first one sum and then another and tie them up in the corners of his garments, begging that his staff should not be told of it. Thus, like a politician of the good old school, he obtained his "commission." Then, with the remaining portion in the up-held skirt of his royal robe, he would retire with his staff to one of the caves and proceed to divide. A dreadful scene always followed, of quarreling and sword-drawing; but they always seemed to come out of it unhurt, and I ceased to worry about them. One day I caught the rascals with my camera, after one of their angriest discussions, as they emerged from their "office." The exactions here were similar to those of Akabah, but largely multiplied, because there were more here to divide with. My photographic apparatus, with my leather cases of glass, were a mystery to them. No custom-house appraiser was ever more gloriously baffled over the witchery of a female smuggler than was Salim and his staff over my American camera. It was at last decided to be "magical appara-

tus" which "meant no good to Petra," and I was taxed accordingly.

To Petra's peculiar style of architecture there is only one surviving exception of importance. It is called by the Arabs *Kasr Pharoun*, or the Castle of Pharaoh. Elsewhere on classic soil it would scarcely attract attention. But here, it not only represents an important period in the life of the capital of Idumæa, but it was one of a group of magnificent structures, which represented the wealth and taste of a wonderful people. Its locality is near the western exit of the city. When Burckhardt discovered Petra in 1812, the ruins of a triumphal arch stood nearly opposite the Kasr Pharoun. Now its stones lie upon the ground intermingled with fragments of columns of Egyptian syenite and Arabian porphyry, which still bear their pristine polish and perfect form. Here too, lying in confusion, are the drums of columns which once supported a great building. These, with a dozen piles of ruins near by, tell of wealth and magnificence and of dreadful calamities. Great changes have occurred here in seventy years. When Burckhardt and Laborde were here they saw standing also portions of walls of other structures and a graceful column.* All now lie in ruins. The work of destruction is done largely by the torrents. Each year they come sweeping down the mountain sides, carrying with them rocky débris which they have loosened on their way. By undermining and bombarding the chiseled mysteries of the town, they break them into shapeless masses and even carry their fragments a long distance. The peculiar soft texture of the rock makes the ruins highly destructible. At no place is this so evident as along the higher stairways. Sometimes these are worn almost to smooth inclined planes. In some interiors I could see, by marks high on the walls, where the water had risen. Broken bridges are found in the ravines, and here and there a cemented cistern, filled with rubbish. Some curious lamps were found by our party amid broken pottery, delicate in form and decoration.

West of the Kasr Pharoun I found an unfinished temple, which explains vividly the methods adopted by Petran architects. After the site had been selected, the face of the cliff was smoothed perpendicularly and scaffolding erected; then the work of shaping the façade began at the top. Thus the weight of the material above was always supported solidly during the work, and the débris was never in the way of the workmen. The interior of the structure now under examination was wholly excavated and put to use as a tomb; but the front remains unfinished.

Thus far I had been guided by the descriptions of explorers who had gone before me. I was satisfied that there was more to see. A great ravine leading south-east from the Kasr Pharoun gave me this assurance and seemed to invite a test of my mettle. Calling the attention of my guide, I pointed to the ravine and said: "Tahly-henna" (Come here). His answer was: "La! la! ma-feesh!" (No, no! No good.) But I acted on my own opinion, as one always must with these people, and began the ascent of the ravine, ordering Mousa to follow. I was ambitious to see what others had not seen, and thus add to scanty information concerning this strange site. I was amply rewarded by the discovery of rich treasures. I followed up a dry torrent-bed which wound most curiously for about a mile, and then came within sight of a walled terrace, the finest example of its kind I had yet seen. Just before reaching it, on the left, I was attracted by an irregular doorway. Entering it, I found myself standing within a low chamber containing a large number of fluted columns, all hewn from the mountain. They seemed to bear the weight of the great mass above. The dripping water had dealt hardly with this strange example of architecture, but had stained it in beautiful colors, red, white, and blue. Dr. Olin noticed a similar interior near this, three of whose sides had four fluted semi-columns each. I did not find it. In the time I had I could not begin to see all there was to see. Climbing now to the terrace, a lovely spot was found, about two acres in extent, shut in by lofty cliffs whose sides were adorned with a great number of carved façades, and to whose summits winding stairways led, cut from the rock. This lofty platform was carpeted with grass, and oleanders and fig-trees grew there in profusion.

As I climbed the winding stairway just beyond the walk, I found on its rocky sides niches with tiny figures in them similar to those in the gorge below and not unlike those near the cave of Pan at Cæsarea Philippi. A part of a human foot was found carved in the wall near some curious inscriptions and figures like those on the rocks in the region of Mount Sinai. At the head of the stairway two hollowed-out rocks, canopied by overhanging cliffs, seemed to form pulpits with sounding-boards. Tanks were cut in the rocks beneath, as though for baptism, and away below was a grassy plateau, where our imagination pictured a congregation. It was the only place I saw in Petra which seemed really to have an air of holiness about it. St. Paul might have preached from these lofty pulpits. One

* This column, the Zob Pharoun, as it was called, was seen standing by Gérôme, and also by Dr. Strong, eight years before Mr. Wilson's visit.—EDITOR.

SPUR OF MOUNT HOR—THE RAVINE OF THE DEIR.

can well believe that here the early martyrs assembled. As I turned one of the elbows in my climb, I came upon what others had observed at a distance and called "a pyramid." This was my first disappointment in Petra. What I touched with my hand was unworthy of being dubbed an obelisk, even. It was about twenty feet high. It was twelve feet wide and seven feet through at the base, tapering to about half those dimensions at the apex. It was rough-hewn and undetached from the mountain. A vast platform had been leveled there, and the stone having been cut away about this little monolithic pinnacle, the "pyramid" was left. In a south-westerly direction stood a similar mystery, a trifle smaller in size.

The afternoon was waning now, and I was obliged to make haste. The summit must be gained. The weird wildness of the scene, not without enchantment, was intensified by the shouting which came floating up to us from the lawless rabble who infested the caves near our tents. How pictures, each claiming attention, multiplied on every side! Alas! the day was nearly ended, the sunshine was going, and we must make the descent before dark.

Satisfied that there must be yet more, where there were so many wonders, I clambered down a rocky stairway, which I felt could not have been cut at so great expense of labor without a purpose. I crossed a short depression, ascended another stairway,

A PRELIMINARY GLIMPSE OF PETRA.

and came out upon a summit which had been hewn to a level, from one edge to the other. There, cut in the rocky platform, are several curious tanks and what must be an altar of sacrifice. This is at the west side of the platform, on a rock by itself, to which four stone steps lead. It consists of a shallow circular basin, forty-eight inches in diameter, in the middle of which is a deeper depression eighteen inches across. This was designed, no doubt, to catch the blood. From it runs a small drain drilled through the rock and leading into a tank a few feet away. I looked upon my discovery as one of the "altars in high places," consecrated to false gods, of which

the Old Testament speaks with words of warning. A tiny recess was hewn at the left of the stairway, where the pans, shovels, basins, flesh-hooks, and censers may have been stored by heathen priests. There are other tanks, and possibly remains of other altars, on the plateau. Below these, further to the south, is still another tank, filled with good water and containing some comical little fish. I caught some of them. They are blind, like those found in Mammoth Cave. All these tanks are lowest at the south-east corner, and are supplied there with outlets cut in the rock, leading into channels down the mountain.

Descending a narrow gorge, I came out by the theater. On the way we passed channels and rock-cut cisterns on all sides, and a wide stairway whose colors were as rich and varied as those of any Persian rug. Now and then a tiny garden-spot was reached whose grassy sod alternated with a variety of flowering shrubs and peculiar large bulbous plants, with stalks just shooting forth. In one great reservoir, some twenty by sixty feet in size and twelve deep, several trees are growing. One end of this reservoir is walled with hewn stone, and a flight of stone steps, still well preserved, leads to the bottom. The cement upon the sides is in good condition, and but little cleansing would be needed to make the great receptacle again available. All around are sculptured remains and excavations of various sizes, showing that the ample water supply attracted quite a constituency of dwellers.

Our last morning in Petra was devoted to an excursion to a temple second only in beauty to the Khuzneh, but less florid. It is much larger and is located upon a peak fully fifteen hundred feet above the valley. It is called *El Deir*, or "The Convent." From the plain below the great urn upon its pediment can be seen distinctly, peering above the adjoining rocks. *El Deir* was reached by climbing a deep ravine northwards—a ravine which would have been impassable but for the steps cut in the rock. Sometimes they were upon the very verge of precipices, whose depth could not be fathomed. Through openings between the cliffs, glorious "bits" of the lower town could be observed. After a climb of one hour we reached the spacious façade of *El Deir*—one hundred and fifty-six feet wide and about one hundred feet high. The interior chamber is thirty-seven by forty feet. Inscriptions resembling those near Mount Sinai are found upon the rocks on the ascent and upon the walls of the interior chamber. Opposite the doorway is a niche, over which is an image of the Christian cross.

Other elaborate structures must have been

neighbors to *El Deir*, for here and there in the wide area in front are remains of huge columns and fragments of walls and terraces. Leading to the summit of the mountain out of which the *Deir* is hewn, is a narrow stairway, ending in a level plateau, where stand other extensive ruins. Excavated foundations are found near by in abundance; and the numerous stairways skirting the hills prove also that the neighborhood was much frequented. On an opposite cliff we found a rock-chamber with no façade at all. It is twenty-nine by thirty feet in size, with a niche at the rear ten by fifteen feet. A pediment and pilasters of beautiful design are cut from the rock about the niche.

Near our lofty stand-point, upon the flat surface of a rock, I saw lying in the sun, dead, a lizard about a foot long, and a striped snake twice that length. They were not there when I made the ascent, but had since met, disputed, and rendered "satisfaction" to one another. It may be that this typified the fate of Edom's capital. Perhaps some destroying serpent crept into Petra, challenged the rich, well-fed lizard-citizens to combat, and the battle raged until no soul was left to record the tale!

There is, besides the Greek and Roman influences, a mysterious element of originality in Petran architecture which lends to it a quality not found in other places. When the sway of imperial Rome crept into Petra by way of Asia Minor, Syria, and Egypt, her rock-structures grew rapidly in number. The influence of the excavated temples and tunneled tombs along the Nile, too, is clear not only in the rock-cutting but in the numerous tapering and receding façades, and in the abortive sphinxes and pyramids of the necropolis.

Intelligent Arabs like still to dwell upon their traditions concerning the once prosperous capital. Once a year, when they start in caravans from Hebron to carry oranges and other stores to Akabah for Mecca pilgrims, they prefer to pay a tax to Sheikh Salim, and to come through Petra, rather than pass down the Wady Arabah. Still to-day the sons of Esau want to be merchantmen. Salim would not fix a sum total of taxation for our entrance into Petra. He must have separate sums laid aside for the "purchase" of horse-shoes, barley, sheep, and so on. And how prices have changed since the day of Burckhardt! That noted and conscientious traveler sneaked into Petra as we did. He dressed like a Moslem and brought a tiny goat all the way from Hebron, pretending that he desired to sacrifice it on Mount Hor—the holy Mount of Aaron. That was *his* scheme. He "paid a fellow of Eljy a pair of old horse-shoes to carry the goat" and guide him. His trickery was dis-

covered, however. He took too much interest in the ruins on the way, and became glad to sacrifice the goat half-way up Mount Hor and make good his escape, so annoyed was he by the owner of the horse-shoes. I had to pay thirty dollars for the privilege of making my picture of the six scoundrels on their horses, though their protection during a second visit to the necropolis was "a present." Wherever we went we had to pay extra; and we were shadowed constantly, never being allowed to go any distance alone. Sometimes, to get rid of noise, a seat was sought in some retired place. Presently some débris of rock would be heard rattling down. Then, in the direction of the sound, a dusky head would be seen gazing down, posted there to watch our every movement. Backsheesh could not purchase freedom from this annoyance.

Nor did we succeed in exploring, even under surveillance, all the wonders of Petra. About one hundred yards before reaching the buttressed arch, on the right, is a tunnel beneath the mountain, about fifteen feet wide and nearly as high, perhaps two hundred yards long. It is overgrown with oleander bushes and partly hidden by them. I had nearly reached its further end when I was compelled to retrace my steps:—"Ma feesh!"*

The time had now come to contrive our departure from Sheikh Salim's dominions. Early in the morning my companions and I bade good-bye to the horde about us, and started under the guidance of Mohammed and Yusef, two native Petrans, to visit the Deir and Mount Hor. During our absence Hedayah was to break camp, and to meet us at noon, near the Kasr Pharoun, with our caravan. We were surprised, upon arriving at the appointed place, to see some sixty or seventy Bedouins, mostly mounted, and armed with lances, guns, and an assortment of knives and blunderbusses, awaiting our arrival. When they saw us coming a significant hoot was given, and we felt that trouble was brewing. Hedayah called out to us: "Don't be afraid, gentlemen, but mount your camels and proceed with your journey." It was "the custom," he said, "for these people to attend the departing stranger half a day's journey out of their city." For this scheme of *theirs*, all the horses and men possible had been pressed into the service now to do us honor. "Since they had not had the pleasure of greeting us when we came in, they wished to see us out."

Immediately we mounted our camels, they were seized by the brigands, and made to kneel. We were surrounded by the lancers, Sheikh Salim among them. The hooting be-

came louder and had an element of dissatisfaction and contempt about it which was not calculated to allay our anxiety.

"Keep cool, gentlemen," said the brave Hedayah, who thereupon fell into the most violent of Arabic demonstrations. The gauntlet had been thrown and the fight began. The quiet Mohammed, who had carried my camera for several days, now became a principal, and drawing his sword, made a thrust at our good dragoman. It fell short of its mark, but cut an ugly slit in his leggin without wounding him. Hedayah leaped from his camel, and with uplifted sword attacked Mohammed. The *mêlée* became general, the noise infernal, and we prepared ourselves for the worst. Salim sat there on his horse quietly watching events. Upon his honor being appealed to, he declared that he had no power over his men; that we had remained longer than they wished, and they were not satisfied with the money we had left behind.

While sundry battles of words were going on, each man with sword drawn, I settled with Salim for various "things which had been forgotten," including fifteen dollars for a "change of raiment." Hedayah and Mohammed had a settlement aside. The latter had a claim for two shillings, and for that was willing to kill Hedayah. All things being amicably adjusted at last, we were permitted to move on. Salim and I shook hands warmly once more, and wishing that "God might preserve us during the rest of our journey," he put spur to his horse and was soon out of sight. Not so all his hounds. New claims were made now, in the most threatening manner, and although we moved on, half the scoundrels followed us. Claim after claim was adjusted as we slowly proceeded, until, after an hour of horror, I held my empty purse bottom up in the air and declared that they now had all. Thereupon the greater number dropped behind, only a few remaining to bluster at Hedayah. They too departed at last, after satisfying themselves that there was no more money to be gotten from us.

At last, rid of our tormentors, we proceeded, quickening the pace of our camels. Scarce had we traveled half an hour, when, springing suddenly from behind a rock, a Bedouin made his appearance. At once he began a display of excited pantomime, drawn sword in hand. He made several attempts to stop our leading camels, but was beaten off. He persisted, however, in trying one after another. Exasperated that one man should so browbeat a whole caravan, I ordered some camel-drivers to arrest him and march him under their guns

* "Leading from the stream to the south-eastern entrance of this tunnel are remains of an open water-channel."—*Dr. Strong.*

to the head of the line, meaning to take him to Hebron and put him in prison. When this was done I learned that he had claimed a sovereign for a sheep which, he averred, Abdullah had purchased of him and forgotten to pay for. Afterwards he confessed that he had lied about it, but excused himself by saying that he was a poor man, and having arrived in Petra after the money had been divided, had taken his chances on the road.

Quiet was restored once more, but every rock was now suspected and watched. Presently a man with a gun in his hand was seen on the right coming quickly down a hill. "Sahib? Sahib?" called Hedayah, threateningly drawing his revolver. The wind blew so that the reply was not audible, and Hedayah fired. Had the rusty old weapon been true, one of our own drivers would have been the victim. Hardly had we said to ourselves, "What next, I wonder?" when another Arab appeared, and proved the most troublesome of all. Camel after camel was seized by him with the intention of stopping our march. Losing all patience, Sheikh Ouida, a tax-gatherer from Gaza, whom we found in Petra, and had hired as a scout and guide for a special expedition to follow, struck the fellow on the head with his stone pipe-bowl. This led to open war. Ouida leaped from his horse—the only one in our party—and grappled with the bandit. Several of us dismounted from our camels as quickly as we could, and ran to assist Ouida, now considerably behind us. Before we could reach the scene of battle the rascal had escaped. Running to the top of a hill, he aimed his gun at Hedayah, and said that unless five sovereigns were sent up to him he would fire. I was appealed to, and I called to him to surrender. He refused, and four of the camel-drivers, already ordered in position, at a signal from me fired upon him. With that he threw up his arms, and cried "Sahib," and I sent two men up to bring him down. He was wounded. I had him tied, and left him struggling violently and groaning in the road for his women to find when they drove the flocks home at night.

This wretch claimed a paper which he

said he had received direct from Mohammed in heaven, and had thrown into my tent in Petra, where I had kissed it and touched it to my heart and head! We had shed his blood; so, after leaving him, the good Mussulman Hedayah, fearing the man might live to declare a blood-feud between them, insisted on going back and making peace. Two dollars would be needed. Alas! our whole party could not muster so much. There was only one recourse. We must borrow from our prisoner who was marched to me and the loans solicited. He declared that he was a poor man and had not a piastre on his person. I ordered him searched, excusing myself by saying that in America, when a man lied once, he was never after believed. He protested; but his money-belt was unbuckled and found well lined with some of the very dollars which I had paid Salim! We borrowed them of our prisoner to make peace with our enemy. The wounded man was again visited. He was found lying insensible in the road. The money was thrust into his clutched fist; Hedayah kissed him on each cheek, recited some passages from the Koran, and peace was declared and recorded in Heaven. Once more we proceeded on our way. No halt was made for lunch that evening until the eastern border of the Wady Arabah had been reached. We were too anxious until then to eat or rest. The "Rock of El Gohr" was no "refuge" for us. We passed it with all speed to escape the Edomites. Our camp was guarded during several succeeding nights. Through each day Ouida acted as scout, signaling us from the hill-tops when it was safe to follow, or leaving his lance in sight as a warning to us to halt, while he investigated certain black Bedouin specks in the distance.

It was not long after that Professor Palmer and his companions were murdered in the Arabian desert, not far from the region through which we had just passed. Calm reflection satisfies me, after our successful feat in the "taking of Petra," that our little party was in peril during every hour of the journey, from the time we left Akabah until we had passed through Edom and entered Canaan.

Edward L. Wilson.

A CLOUD ON THE MOUNTAIN.

RUTH MARY stood on the high riverbank, looking along the beach below to see if her small brother Tommy was lurking anywhere under the willows with his fishing-pole. He had been sent half an hour before to the earth cellar for potatoes, and Ruth Mary's father, Mr. Tully, was waiting for his dinner.

She did not see Tommy; but while she lingered, looking at the river hurrying down the shoot between the hills, and curling up over the pebbles of the bar, she saw a team of bay horses and a red-wheeled wagon come rattling down the stony slope of the opposite shore. In the wagon she counted four men. Three of the men wore white, helmet-shaped hats that made brilliant spots of light against the bank. The horses were driven half their length into the stream and allowed to drink as well as they could for the swiftness of the current, while the men seemed to consult together, the two on the front seat turning back to speak with the two behind, and pointing across the river.

Ruth Mary watched them with much interest; for travelers, such as these seemed to be, seldom came as far up Bear River valley as the Tullys' cattle range. The visitors who came to them were mostly cow-boys looking up stray cattle, or miners on their way to the "Banner district," or packers with mule trains going over the mountains, to return in three weeks or three months as their journey prospered. Fishermen and hunters came up into the hills in the season of trout and deer; but they came, as a rule, on horseback, and at a distance were hardly to be distinguished from the cow-boys and the miners.

The men in the wagon were evidently strangers to that locality. They had seen Ruth Mary watching them from the hill, and now one of them rose up in the wagon, shouting across to her and pointing to the river.

She could not hear his words for the noise of the ripple and the wind which blew freshly down-stream, but she understood that he was inquiring about the ford. She motioned up the river, and called to him, though she knew her words could not reach him, to keep on the edge of the ripple. Her gestures, however, aided by the driver's knowledge of fords, were sufficient; and turning his horses' heads upstream, they took water at the place she had tried to indicate. The wagon sank to the wheel-hubs; the horses kept their feet well though the current was strong; the sun shone

brightly on the white hats and laughing faces of the men, on the guns in their hands, on the red paint of the wagon and the warm backs of the horses breasting the stream. When they were half way across, one of the men tossed a small, reluctant black dog over the wheel into the river, and all the company with the exception of the driver, who was giving his attention to his horses, broke into hilarious shouts of encouragement to the swimmer in his struggle with the current. It was carrying him down and would probably land him, without effort of his own, on a strip of white sand beach under the willows above the bend; but now the unhappy little object, merely a black nose and two blinking anxious eyes above the water, had drifted into an eddy from which he cast forlorn glances toward his faithless friends in the wagon. The dog was in no real peril, but Ruth Mary did not know it, and her heart swelled with indignant pity. Only shyness kept her from wading to his rescue. But now one of the laughing young men, thinking, perhaps, the joke had gone far enough, and reckless of a wetting, leaped out into the water, and plunging along in his high boots, soon had the terrier by the scruff of his neck, and waded ashore with his sleek, quivering little body nestled in the bosom of his flannel hunting shirt.

A deep cut in the bank, through which the wagon was dragged, was screened by willows. When the fording party arrived at the top, Ruth Mary was nowhere to be seen. "Where's that girl got to all of a sudden?" one of the men demanded. They had intended to ask her several questions; but she was gone, and the road before them plainly led to the low-roofed cabin, and loosely built barn, with straw and daylight showing through its cracks, the newly planted poplar-trees above the thatched earth cellar, and all the signs of a tentative home in this solitude of the hills.

They drove on slowly, the young man who had waded ashore, whom his comrades addressed as Kirkwood or Kirke, walking behind the wagon with the dog in his arms, responding to his whimpering claims for attention with teasing caresses. The dog seemed to be the butt as well as the pet of the party. As they approached the house, he scrambled out of Kirkwood's arms and lingered to take a roll in the sandy path, coming up a moment afterward to be received with blighting sarcasms as to his appearance. After his ignominious

wetting, he was quite unable to bear up under them, and slunk to the rear with deprecatory blinks and waggings of his tail whenever one of the men looked back.

Ruth Mary had run home quickly to tell her father, who was sitting in the sun by the wood-pile, of the arrival of strangers from across the river. Mr. Tully rose up deliberately and went to meet his guests, keeping between his teeth the sliver of pine he had been chewing while waiting for his dinner. It helped to bear him out in that appearance of indifference he thought it well to assume, as if such arrivals were an every-day occurrence.

"Hasn't Tommy got back yet, mother?" Ruth Mary asked as she entered the house. Mrs. Tully was a stout, low-browed woman, with grayish yellow hair of that dry and lifeless texture which shows declining health or want of care. Her blue eyes looked faded in the setting of her tanned complexion. She sat in a low chair, her knees wide apart, defined by her limp calico draperies, rocking a child of two years, a fat little girl, with flushed cheeks, and flaxen hair braided into tight knots on her forehead, who was asleep in the large cushioned rocking-chair in the middle of the room. The room looked bare, for the shed room outside was evidently the more-used part of the house. The cook-stove was there in the inclosed corner, and beside it a table and shelf with a tin hand-basin hanging beneath, while the crannies of the logs on each side of the doorway were utilized as shelves for all the household articles in frequent requisition that were not hanging from nails driven into the logs or from the projecting roof-poles against the light.

Tommy had not returned, and Mrs. Tully suggested as a reason for his delay that he had stopped somewhere to catch grasshoppers for bait.

"I should think he had enough of 'em in that bottle of his," Ruth Mary said, "to last him till the 'hoppers come again. Some strange men forded the river just now. Father's gone to speak to them. I guess he'll ask 'em to stop to dinner."

Mrs. Tully got up heavily and went to the door. "Here, Angy —" she addressed a girl of eight or ten years who sat on the flat bowlder which was the cabin door-step. "You go get them 'taters — that's a good girl," she added coaxingly, as Angy did not stir. "If your foot hurts you, you can walk on your heel."

Angy, who was complaining of a stone-bruise, got up and limped away, upsetting from her lap as she rose two kittens of tender years, who tumbled over each other before getting their legs under them, and staggered off, steering themselves jerkily with their tails.

"Oh, Angy!" Ruth Mary remonstrated; but she could not stay to comfort the kittens. She ran up the short, crooked stairs leading to the garret bedroom which she shared with Angy, hastily put on her shoes and stockings and braced her pretty figure, under the blue calico sack she wore, with her first pair of stays, an important purchase made on her last visit to the town in the valley, and to be worn now, if ever. It was hot at noon in the bedroom under the roof, and by the time Ruth Mary had fortified herself to meet the eyes of strangers, she was uncomfortably flushed and short of breath besides, from the pressure of the new stays. She went slowly down the uneven stairs, wishing she could walk as softly in her shoes as she could barefoot.

Her father was talking to the strangers in the shed room. They looked tall and formidable, under the low roof against the flat glare of the sun on the hard swept ground in front of the shed. She waited inside until her mother reminded her of the dinner, half-cooked on the stove; then she went out shyly, the light falling on her downcast face and full white eyelids, on her yellow hair, sun-faded and meekly parted over a forehead low like her mother's, but smooth as one of the white stones of the river beach. Her fair skin was burned to a clear light red tint like a child's, and her blonde eyebrows and lashes looked silvery against it, but her chin was very white underneath, and there was a white space behind each of her little ears where her hair was knotted tightly away from her neck.

"This is my daughter," Mr. Tully said, briefly, and then he gave some hospitable orders about dinner which the strangers interrupted, saying they had a lunch with them and would not trouble his family until supper-time.

They gathered up their hunting gear and, lifting their hats to Ruth Mary, followed Mr. Tully, who had offered to show them the best fishing on that part of the river.

Mr. Tully explained to his wife and daughter, as the latter placed the dinner on the table, that three of the strangers were the engineers from the railroad camp at Moor's Bridge, and the fourth was a packer and teamster from the same camp; that they were all going up the river to look at timber, and wanted a little sport by the way. They had expected to keep on the other side of the river, but seeing the ranch on the opposite shore, with wheel-tracks going down to the water, they had concluded to try the ford and the fishing and ask for a night's accommodation.

"They don't want we should put ourselves out any. They're used to roughin' it, they say. If you can git together somethin' to feed 'em on, mother, they say they'd as soon

sleep on the straw in the barn as anywheres else."

"There's plenty to eat, such as it is, but Ruth Mary'll have it all to do. I can't be on my feet." Mrs. Tully spoke in a depressed way, but to her no less than to her husband was this little break welcome in the monotony of their life in the hills; even though it brought with it a more vivid consciousness of the family circumstances and a review of them in the light of former standards of comfort and gentility. For Mrs. Tully had been a woman of some social ambition in the small Eastern village where she was born. To all that to her guests made the unique charm of the place, she had grown callous, if she had ever felt it at all, while dwelling with an incurable regret upon the neatly painted houses and fenced door-yards, the gatherings of women in their best clothes in primly furnished parlors on summer afternoons, the church-going, the passing in the street, and, more than all, the house-keeping conveniences she had been used to, accumulated through many years' occupancy of the same house.

"Seems as though I hadn't any ambition left," she often complained to her daughter. "There's nothin' here to do with, and nobody to do for. The most of the folks we ever see wouldn't know sour-dough bread from salt-risin', and as for dressin' up, I might keep the same clothes on from Fourth July till Christmas — your father'd never know."

But Ruth Mary was haunted by no flesh-pots of the past. As she dressed the chickens and mixed the biscuit for supper, she paused often in her work and looked towards the high pastures with the pale brown lights and purple shadows on them, rolling away and rising towards the great timbered ridges, and these lifting, here and there along their profiles a treeless peak or bare divide into the regions above vegetation. She had no misgivings about her home. Fences would not have improved her father's vast lawn, to her mind, or white paint the low-browed front of his dwelling; nor did she feel the want of a stair-carpet and a parlor-organ. She was sure that they, the strangers, had never seen anything more lovely than her beloved river, dancing down between the hills, tripping over rapids, wrinkling over sand-bars of its own spreading, and letting out its speed down the long reaches where the channel was deep.

About four o'clock she found leisure to stroll along the shore with Tommy, whose competitive energies as a fisherman had been stimulated by the advent of strange craftsmen with scientific-looking tackle. Tommy must forthwith show what native skill could do, with a willow pole and grasshoppers for bait. But

Ruth Mary's sense of propriety would by no means tolerate Tommy's intruding his company upon the strangers, and to frustrate any rash, gregarious impulses on his part, she judged it best to keep him in sight.

Tommy knew of a deep pool under the willows which he could whip unseen in the shady hours of the afternoon. Thither he led Ruth Mary, leaving her seated upon the bank above him, lest she should be tempted to talk, and so interfere with his sport. The moments went by in silence, broken only by the river; Ruth Mary happy on the high bank in the sun, Tommy happy by the shady pool below, and now and then slapping a lively trout upon the stones. Across the river two Chinamen were washing gravel in a rude miner's cradle, paddling about on the river's brink and anon staggering down from the gravel bank above, with large square kerosene cans filled with pay dirt balanced on either end of a pole across their meager shoulders. Bare-headed, in their loose garments, with their pottering movements and wrinkled faces, shining with heat, they looked like two weird, unrevered old women working out some dismal penance. High up in the sky the great black buzzards sailed and sailed on slanting wing; the wood doves coo-oo-ed from the willow thickets that gathered the sunlight close to the water's edge. A few horses and cattle moved like specks upon the sides of the hills, cropping the bunch-grass, but the greater herds had been driven up into the high pastures where the snow falls early; and all these lower hills were bare of life, unless one might fancy that the far-off processions of pines against the sky marching up the northern sides of the divides, had a solemn personality, going up, like priests to a sacrifice, or that the restless river, flowing through the midst of all and bearing the light of the white noonday sky deep into the bosom of the darkest hills, had a soul as well as a voice. In its sparkle and ever-changing motion, it was like a child among its elders at play. The hills seemed to watch it, and the great cloud-heads as they looked down between the parting summits, and the three tall pines, standing about a young bird's flight from each other by the shore, and mingling their fitful crooning with the river's babble.

It is pleasant to think of Ruth Mary, sitting high above the river in the peaceful afternoon, surrounded by the inanimate life that to her brought the fullness of companionship, and left no room for vain cravings; the shadow creeping upward over her hands folded in her lap, the light resting on her girlish face and meek, smooth hair. For this was during that unquestioning time of content which may not always last, even in a life as

safe and as easily predicted as hers. But even now this silent communion was interrupted by the appearance of one of Tommy's rivals. It was the young man whose comrades called him Kirke, who came along the shore, stooping under the willow boughs and scattering all their shadows, lightly traced on the stones below. He held his fishing-rod couched like a lance in one hand, and a string of gleaming fish in the other.

Tommy, with his practiced eye, rapidly counted them and saw with chagrin that he was outnumbered, but another look satisfied him that the stranger's catch was nearly all white-fish instead of trout. He caressed his own dappled beauties complacently.

Kirkwood stopped and looked at them; he was evidently impressed by Tommy's superior luck.

"These are big fellows," he said; "did you catch them?"

"You don't suppose *she* did," said Tommy, with a jerk of his head towards Ruth Mary.

Kirkwood looked up and smiled, seeing the young girl on her sunny perch. The smile lingered pleasantly in his eyes as he seated himself on the stones,—deliberately, as if he meant to stay.

Tommy watched him while he made himself comfortable, taking from his pocket a short meerschaum pipe and a bag of tobacco, leisurely filling the pipe and lighting it with a wax match held in the hollow of his hands—apparently from habit, for there was no wind. He did not seem to mind in the least that his legs were wet and that his trout were nearly all white-fish. He was evidently a person of happy resources, and a joy-compelling temperament, that could find virtue in white-fish if it couldn't get trout. He began to talk to Tommy, not without an amused consciousness of Tommy's silent partner on the bank above, nor without an occasional glance up at the maidenly head serenely exalted in the sunlight. Nor did Ruth Mary fail to respond, with her down-bent looks, as simply and unawares as the clouds turning their bright side to the sun.

Tommy, on his part, was stoutly withholding in words the admiration his eyes could not help showing of the strange fisherman's tools. He cautiously felt the weight of the ringed and polished rod, and snapped it a little over the water; he was permitted to examine the book of flies and to handle the reel, things in themselves fascinating, but to Tommy's mind merely a hinderance and a snare to the understanding in the real business of catching fish. Still, he admitted, where a man could take a whole day, all to himself like that, without fear of being called off at any moment by the women on some frivolous household errand,

he might afford to potter with such things. Tommy kept the conservative attitude of native experience and skill towards foreign contrivance.

"If Joe Enselman was here," he said, "I bet he could ketch more fish in half'n hour with a pole like this o' mine and a han'ful o' 'hoppers, than any of you can in a whole week o' fishing with them fancy things."

"Oh, Tommy!" Ruth Mary expostulated, looking distressed.

"Who is this famous fisherman?" Kirkwood asked, smiling at Tommy's boast.

"Oh, he's a feller I know. He's a packer, and he owns ha'f o' father's stock. He's goin' to marry our Sis soon's he gits back from Sheep Mountain, and then he'll be my brother." Tommy had been a little reckless in his desire for the distinction of a personal claim on the hero of his boyish heart. He was even conscious of this himself, as he glanced up at his sister.

Kirkwood's eyes involuntarily followed Tommy's. He withdrew them at once, but not before he saw the troubled blush that reddened the girl's averted face. It struck him, though he was not deeply versed in blushes, that it was not quite the expression of a happy, maidenly consciousness, when the name of a lover is unexpectedly spoken.

It was the first time in her life that Ruth Mary had ever blushed at Joe Enselman's name. She could not understand why it should pain her to have this young stranger hear of him in his relation to herself.

Before her blush had faded, Kirkwood had dismissed the subject of Ruth Mary's engagement with the careless reflection that Enselman was probably not the right man, but that the primitive laws which decide such haphazard unions, doubtless provided the necessary hardihood of temperament wherewith to meet their exigencies. She was a nice little girl, but possibly she was not so sensitive as she looked.

His pipe had gone out, and after relighting it, he showed Tommy the gayly pictured paper match-box which opened with a spring, and disclosed the matches lying in a little drawer within. Tommy's wistful eyes, as he returned the box, prompted Kirkwood to make prudent search in his pockets for a second box of matches before presenting Tommy with the one his eyes coveted. Finding himself secure against want in the immediate future, he gave himself up to the mild amusement of watching Tommy with his new acquisition.

Tommy could not resist lighting one of the little tapers, which burned in the sunlight with a still, clear flame like a Christmas candle. Then a second one was sacrificed. By this time the

attraction was strong enough to bring Ruth Mary down from her high seat in the sun. She looked hardly less a child than Tommy, as with her face close to his, she watched the pale flame flower wasting on its waxen stem. Then she must needs light one herself and hold it, with a little fixed smile on her face, till the flame crept down and warmed her finger-tips.

"There," she said, putting it out with a breath, "don't let us burn any more. It's too bad to waste 'em in the daylight."

"We will burn one more," said Kirkwood, "not for amusement, but for information." And while he whittled a piece of drift-wood into the shape of a boat, he told Ruth Mary how the Hindoo maidens set their lighted lamps afloat at night on the Ganges, and watch them perilously voyaging, to learn, by the fate of the little flame, the safety of their absent lovers.

He told it simply and gravely, as he might have described some fact in natural history, for he rightly guessed that this little seed of sentiment fell on virgin soil. According to Tommy, Ruth Mary was betrothed and soon to be a wife, but Kirkwood was curiously sure that she knew not love, nor even fancy. Nor had he any rash idea of trying to enlarge her experience. He spoke of the lamps on the Ganges because they came into his mind while Ruth Mary was bending over the wasting match flame; any hesitation he might have had about introducing so delicate a topic was conquered by an idle fancy that he would like to observe its effect upon her almost pathetic innocence.

While he talked, interrupting himself as his whittling absorbed him, but always conscious of her eyes upon his face, the boat took shape in his hands. Tommy had failed to catch the connection between Hindoo girls and boat-making, but was satisfied with watching Kirkwood's skillful fingers, without paying much heed to his words. He had a wonderful knife, too, with tools concealed in its handle, with one of which he bored a hole for the mast. In the top of the mast he fixed one of the wax tapers upright and steady for the voyage.

Ruth Mary's cheeks grew red, as she suddenly perceived the intention of Kirkwood's whittling.

"Now," he said, steadying the boat on the shallow ripple, "before we light our beacon you must think of some one you care for who is away. Perhaps Tommy's friend, on Sheep Mountain?" he ventured softly, glancing at Ruth Mary.

The color in her cheeks deepened, and again Kirkwood fancied it was not a happy confusion that covered her downcast face.

"No?" he questioned, as Ruth Mary did not speak; "that is too serious, perhaps. Well, then, make a little wish, and if the light is still

alive when the boat passes that rock—the flat one with two stones on top—the wish will come true. But you must have faith, you know."

Ruth Mary looked at Kirkwood, the picture of faith in her sweet seriousness. His heart smote him a little, but he met her wide-eyed gaze with a gravity equal to her own.

"I would rather not wish for myself," she said, "but I will wish something for you, if you want me to."

"That is very kind of you. Am I to know what it will be?"

"Oh, yes. You must tell me what to wish."

"That is easily done," said Kirkwood gayly. "Wish that I may come back some other day, and sit here with you and Tommy by the river."

It was impossible not to see that Ruth Mary was blushing again. But she answered him with a gentle courtesy that rebuked the foolish blush: "That will be wishing for us all."

"Shall we light up then, and set her afloat?"

"I've made a wish," shouted Tommy; "I've wished Joe Enselman would bring me an injun pony—a good one that won't buck!"

"You must keep your wish for the next trip. This ship is freighted deep enough already. Off she goes then, and good luck to the wish," said Kirkwood, as the current took the boat with the light at its peak burning clearly, and swept it away. The pretty plaything dipped and danced a moment, while the light wavered, but still lived. Then a breath of wind shook the willows, and the light was gone.

"Now it's my turn," Tommy exclaimed, wasting no sentiment on another's failure. He rushed down the bank and into the shallow water to catch the wishing-boat before it drifted away.

"All the same, I'm coming back again," said Kirkwood, looking at Ruth Mary.

Tommy's wish fared no better than his sister's, but he bore up briskly, declaring it was "all foolishness any way," and accused Kirkwood of having "just made it up for fun."

Kirkwood only laughed, and, ignoring Tommy, said to Ruth Mary, "The game was hardly worth the candle, was it?"

"Was it a game?" she asked. "I thought you meant it for true."

"Oh, no," he said; "when we try it in earnest we must find a smoother river and a stronger light. Besides, you know, I'm coming back."

Ruth Mary kept her eyes upon his face, still questioning his seriousness, but its quick changes of expression baffled while fascinating her. She could not have told whether she thought him handsome or not, but she had a desire to look at him all the time.

Suddenly her household duties recurred to her, and refusing the help of Kirkwood's hand, she sprang up the bank and hurried back to the house. Kirkwood could see her head above the wild-rose thickets as she went along the high path by the shore. He was more than ever sure that Enselman was not the right man.

At supper Ruth Mary waited on the strangers in silence, while Angy kept the cats and dogs "coralled," as her father said, in the shed, that their impetuous appetites might not disturb the feast.

Mr. Tully stood in the doorway and talked with his guests while they ate, and Mrs. Tully, with the little two-year-old in her lap, rocked in the large rocking-chair and sighed apologetically between her promptings of Ruth Mary's attendance on the table.

Tommy hung about in a state of complete infatuation with the person and conversation of his former rival. He was even beginning to waver in his allegiance to his absent hero, especially as the wish about the Indian pony had not come true.

During the family meal the young men sat outside in the shed room and smoked, and lazily talked together. Their words reached the silent group at the table. Kirkwood's companions were deriding him as a recreant sportsman. He puffed his short-stemmed pipe and looked at them tranquilly. He was not dissatisfied with his share of the day's pleasure.

When Mr. Tully had finished his supper he took the young men down to the beach to look at his boat. Kirkwood had pointed it out to his comrades, where it lay moored under the bank, and ventured the opinion of a boating man that it had not been built in the mountains. But there he had generalized too rashly.

"I built her myself," said Mr. Tully; "rip-sawed the lumber up here. My young ones are as *handy* with her!" he boasted cheerfully, warmed by the admiration his work called forth. "You'd never believe, to see 'em knocking about in her, they hadn't the first one of 'em ever smelt salt water. Ruth Mary, now, the oldest of 'em, is as much to home in that boat as she is on a hoss — and that's sayin' enough. She looks quiet, but she's got as firm a seat and as light a hand as any cow-boy that ever put leg over a cayuse."

Mr. Tully on being questioned admitted willingly that he was an Eastern man — a Down-East lumberman and boat-builder. He couldn't say just why he'd come West. Got restless, and his wife's health was always poor back there. He had mined it some and had considerable luck — cleaned up several thousands the summer of '63 at Junction Bar. Put it in a saw-mill and got burned out. Then he took up this cattle range and went into

stock in partnership with a young fellow from Montana, named Enselman. They expected to make a good thing of it, but it *was* a long ways from anywheres; and for months of the year they couldn't do any teaming. Had no way out except by the horseback trail. The women found it lonesome. In winter no team could get up that grade in the cañon they call the "freeze-out," even if they could cross for ice in the river; and from April to August the river was up so you couldn't ford.

All this in the intervals of business, for Mr. Tully in his circuitous way was agreeing to build a boat for the engineers after the model of his own. He would have to go down to the camp at Moor's Bridge to build it, he said, for suitable lumber could not be procured so far up the river, except at great expense. It would take him better'n a month anyhow, and he didn't know what his women folks would say to having him so long away. He would see about it.

The four men sauntered up the path from the shore, Tommy bringing up the rear with the little black-and-tan terrier. In default of a word from his master, Tommy tried to make friends with the dog, but the latter, wide awake and suspicious after dozing under the wagon all the afternoon, would none of him. Possibly he divined that Tommy's attentions were not wholly disinterested.

The family assembled for the evening in the shed room. The women were silent, for the talk was confined to masculine topics, such as the quality of the placer claims up the river, the timber, the hunting, the progress and prospects of the new railroad. Tommy, keeping himself forcibly awake, was seeing two Kirkwoods where there was but one. The terrier had taken shelter between Kirkwood's knees, after trying conclusions with the mother of the kittens — a cat of large experience and a reserved disposition, with only one ear, but otherwise in full possession of her faculties.

Betimes the young men arose and said good-night. Mr. Tully was loath to have the evening, with its rare opportunity for conversation, come to a close, but he was too modest a host to press his company upon his guests. He went with them to their bed on the clean straw in the barn, and if good wishes could soften pillows the travelers would have slept sumptuously. They did not know, in fact, how they slept, but woke strong and joyous over the beauty of the morning on the hills, and the prospect of continuing their journey.

They parted from the family at the ranch with a light-hearted promise to stop again on their way down the river. When they would return they were gayly uncertain; — it might be ten days, it might be two weeks. It was

a promise that nestled with delusive sweetness in Ruth Mary's thoughts as she went silently about her work. She was helpful in all ways, very gentle with the children, but she lingered more hours dreaming by the river, and often at twilight she climbed the hill back of the cabin and sat there alone, her cheek in the hollow of her hand, until the great planes of distance were lost, and all the hills drew together in one dark profile against the sky.

MRS. TULLY had been intending to spare Ruth Mary for a journey to town on some errands of a feminine nature which could not be intrusted to Mr. Tully's larger but less discriminating judgment. Ruth Mary had never before been known to trifle with an opportunity of this kind. Her rides to town had been the one excitement of her life; looked forward to with eagerness and discussed with tireless interest for many days after. But now she hung back with an unaccountable apathy, and made excuses for postponing the ride from day to day, until the business became too pressing to be longer neglected. She set off one morning at daybreak, following the horseback trail round the steep and sliding bluffs high above the river, or across beds of broken lava rock, arrested avalanches from the slowly crumbling cliffs which crowned the bluff; or picking her way at a soft-footed pace through the thickets of the river bottoms. In such a low and sheltered spot, scarcely four feet above the river she found the engineers' camp, a group of white tents shining among the willows. She keenly noted its location and surroundings. The broken timbers of the old bridge projected from the bank a short distance above the camp; a piece of weather-stained canvas stretched over them formed a kind of awning shading the rocks below, where the Chinese cook of the camp sat impassively fishing. The camp had a deserted look, for the men were all at work tunnelling the hill half a mile lower down. Her errands kept her so late that she was obliged to stay over night at the house of a friend of her father's, who owned a fruit ranch near the town. They were prosperous, talkative people, who loudly pitied the isolation of the family in the upper valley.

Ruth Mary reached home about noon the next day, tired and several shades more deeply sun-burned, to find that she had passed the engineers without knowing it on their way down the river by the wagon road on the other side. They had stopped over night at the ranch, and made an early start that morning. Ruth Mary was obliged to listen to enthusiastic reminiscences from each member of the family of the visit she had missed.

This was the last social event of the year. The willow copses turned yellow and threadbare; the scarlet hips of the rosebush looked as if tiny finger-tips had left their prints upon them. The wreaths of wild clematis turned ashen gray, and were scattered by the winds. The wood-dove's cooing no longer sounded at twilight in the leafless thickets. They had gone down the river and the wild duck with them.

But the voice of the river, rising with the autumn rains, was loud on the bar; the sky was hung with clouds that hid the hill-tops or trailed their ragged pennants below their summits. The mists lay cold on the river; they rose with the sun, dissolving in soft haze that dulled the sunshine, and at night descending, shrouded the dark, hoarse water without stilling its lament. Then the first snow fell, and ghostly companies of deer came out upon the hills, or filed silently down the draws of the cañons at morning and evening. The cattle had come down from the mountain pastures, and at night congregated about the buildings with deep breathings and sighings; the river murmured in its fretted channel; now and then the yelp of a hungry coyote sounded from the hills.

The young men had said, among their light and pleasant sayings, that they would like to come up again to the hills when the snow fell, and get a shot at the deer; but they did not come, though often Ruth Mary stood on the bank and looked across the swollen ford, and listened for the echo of wheels among the hills.

About the first of November Mr. Tully went down to the camp at Moor's Bridge to build the engineers' boat. The women were now alone at the ranch, but Joe Enselman's return was daily expected. Mr. Tully, always cheerful, had been confident that he would be home by the 5th.

The 5th of November and the 10th passed, but Enselman had not returned. On the 12th, in the midst of a heavy fall of snow, his pack animals were driven in by another man, a stranger to the women at the ranch, who said that Enselman had changed his mind suddenly about coming home that fall, and decided to go to Montana and "prove up" on his ranch there.

Mr. Tully's work was finished before the 1st of December. On his return to the ranch he brought with him a great brown paper bundle which the children opened by the cabin fire on the joyous evening of his arrival. There were back numbers of the illustrated magazines and papers, stray copies of which now and then had drifted into the hands of the voracious young readers in the cabin. There were a few novels, selected by Kirkwood from the camp library, with especial

reference to Ruth Mary. For Tommy there was a duplicate of the wonderful pocket-knife he had envied Kirkwood. Angry was remembered with a little music-box which played "Willie, we have missed you," with a plaintive iteration that brought the sensitive tears to Ruth Mary's eyes; and for Ruth Mary herself there was a lace pin of hammered gold.

"He said it must be your wedding present from him, as you'd be married likely before he saw you again," Mr. Tully said, with innocent pride in the gift with which his daughter had been honored.

"Who said that?" Ruth Mary asked.

"Why, Mr. Kirkwood said it. He's the boss one of the whole lot to my thinkin'. He's got that *way* with him some folks has! We had some real good talks evenings, down on the rocks under the old bridge — I told him about you and Enselman —"

"Father, I wish you hadn't done that." The protest in Ruth Mary's voice was stronger than her words.

She had become slightly pale when Kirkwood's name was mentioned, but now, as she held out the box with the trinket in it, a deep blush covered her face.

"I cannot take it, father. Not with that message. He can wait till I'm married before he sends me his wedding present."

To her father's amazement, she burst into tears and went out into the shed room, leaving Kirkwood's ill-timed gift in his hands.

"What in all conscience's sake's got into her?" he demanded of his wife. "To take offense at a little thing like that! She didn't use to be so techy."

Mrs. Tully nodded her head at him sagely and glanced at the children, a hint that she understood Ruth Mary's state of mind, but could not explain before them.

At bed-time, the father and mother being alone together, Mrs. Tully revealed the cause of her daughter's sensitiveness, according to her theory of it. "She's put out because Joe Enselman chose to wait till spring before marryin' and went off to Montany instead of comin' home as he said he would."

"Sho, sho!" said Mr. Tully. "That don't seem like Ruth Mary! She ain't in any such a hurry as all that comes to. I've had it on my mind lately, that she took it a little *too* easy."

"You'll see," said the mother. "She ain't in any hurry, but she likes *him* to be. She feels's if he thought more of money-makin' than he does of her. She's like all girls. She won't use her reason and see it's all for her in the end he's doin' it."

"Why didn't you tell her 'twas my plan his goin' to Montany this fall. He wouldn't listen to it nohow, then. He'd rather lose his

ranch than wait any longer for Sis, so he said — but I guess he's seen the sense of what I told him. Ruth Mary ain't a-goin' to run away, I says, even if ye don't prove up on her this fall. You ought to a-told her, mother, 'twas my proposition."

"I told her that and more too. I told her it showed he'd make a good provider. She looked at me solemn as a graven image all the time I was talkin' and not a word out of her. But that's Ruth Mary. I never said the child was sullen, but she is just like your sister Ruth — the more she feels, the less she talks."

"Well," said Mr. Tully, "that's all right, if that's it. That'll all straighten out with time. It was natural perhaps she should fire up at the talk about marryin' if she felt the bridegroom was hangin' back. Why, Joe, — he'd eat the dirt she treads on, if he couldn't make her like him no other way! He's most too foolish about her, to my thinkin'. That's what took me so by surprise when word came back he'd gone to Montany after all — I didn't expect anything so sensible of him."

"'Twas a reg'lar man's piece o' work anyhow," said Mrs. Tully disconsolately. "And you'll be sorry for it, I'm afraid. I never knew any good come of puttin' off a marriage where everything was suitable, just for a few hundred acres of wild land, more or less."

"No use your worryin'," said Mr. Tully. "Young folks always has their little troubles before they settle down — besides, what sort of a marriage would it be if you or I could make it or break it?" But he bore himself with a deprecating tenderness towards his daughter, in whose affairs he had meddled, perhaps disastrously, as his better-half feared.

THE winters of Idaho are not long even in the higher valleys. Close on the cold footsteps of the retreating snows trooped the first wild flowers. The sun seemed to laugh in the cloudless sky. The children were let loose on the hills; their voices echoed the river's roar. Its waters, rising with the melting snows, no longer babbled childishly on their way; they shouted, and brawled, and tumbled over the bar, rolling huge pine trunks along as if they were sticks of kindling wood.

One cool May evening, Ruth Mary, climbing the path from the beach, saw there was a strange horse and two pack animals in the corral. She did not stop to look at them, but quickly guessing who their owner must be, she went on to the house, her knees weak and trembling, her heart beating heavily. Her father met her at the door and detained her outside. She was prepared for his announcement. She knew that Joe Enselman had returned, and that the time was come for her to

prove her new resolve born of the winter's silent struggle.

"I thought I'd better have a few words with you, Ruthie, before you see him—to prepare your mind. Set down here." Mr. Tully took his daughter's hands in his own and held them while he talked.

"You thought it was queer Joe staid away so long, didn't you?" Ruth Mary opened her lips to speak, but no words came. "Well, I did," said the father. "Though it was my plan first off. I might a-know'd it was something more'n business that kep' him. Joe's had an accident. It happened to him just about the time he meant to a-started for home. It broke him all up,—made him feel like he didn't want to see any of us just then. He was goin' along a trail through the woods one dark night; he never knew what stunned him; must have been a twig or something struck him in the eye; he was giddy and crazy-like for a spell—his horse took him home. Well, he aint got but one eye left, Joe aint. There, Sis, I knew you'd feel bad. But he's well. It's hurt his looks some, but what's looks! We aint any of us got any to brag on. Joe had some hopes at first he'd git to seein' again out of the eye that was hurt, and so he sent home his animals and put out for Salt Lake to show it to a doctor there; but it wasn't any use. The eye's gone; and it doos seem as if for the time bein' some of Joe's grit had gone with it. He went up to Montany and tended to his business, but it was all like a dumb show and no heart in it. It's cut him pretty deep, through his bein' alone so long perhaps, and thinkin' about how you'd feel. And then he's pestered in his mind about marryin'. He feels he's got no claim to you now. Says it aint fair to ask a young girl that's likely to have plenty good chances to tie up to what's left of *him*. I wanted you should know about this before you go inside. It might hurt him some to see a change in your face when you look at him first. As to his givin' you your word back, that you'll settle between yourselves, but however you fix it I guess you'll make it as easy as you can for Joe. I don' know as I ever see a big strappin' fellow so put down."

Mr. Tully had waited between his short and troubled sentences for some response from Ruth Mary, but she was still silent. Her hands felt cold in his. As he released them she leaned suddenly forward and hid her face against his shoulder. She shivered and her breast heaved, but she was not weeping.

"There, there!" said Mr. Tully, stroking her head clumsily with his large hand. "I've made a botch of it. I'd ought to let your mother told ye."

She pressed closer to him, and wrapped her arms around him without speaking.

"I expect I better go in now," he said gently, putting her away from him. "Will you come along o' me, or do you want to git a little quieter first?"

"You go in," Ruth Mary whispered. "I'll come soon."

It was not long before she followed her father into the house. No one was surprised to see her white and tremulous. She seemed to know where Enselman sat without raising her eyes; neither did he venture to look at her as she came to him and stooping forward laid her little cold hands on his.

"I'm glad you've come back," she said. Then sinking down suddenly on the floor at his feet, she threw her apron over her head and sobbed aloud.

The father and mother wept too. Joe sat still, with a great and bitter longing in his smitten countenance, but not daring to comfort her.

"Pick her up, Joe," said Mr. Tully. "Take hold of her, man, and show her you've got a whole heart if you aint got but one eye."

It was understood, as Ruth Mary meant it should be, without more words, that Enselman's misfortune would make no difference in their old relation. The difference it had made in that new resolve born of the winter's struggle, she told to no one—for to no one had she confided her resolve.

JOE stayed two weeks at the ranch, and was comforted into a semblance of his former hardy cheerfulness. But Ruth Mary knew that he was not happy. One evening he asked her to go with him down the high shore path. He told her that he was going to town the next day on business that might keep him absent about a fortnight, and entreated her to think well of her promise to him, for on his return he should expect its fulfillment. For God's sake, he begged her to let no pity for his misfortune blind her to the true nature of her feeling for him. He held her close to his heart and kissed her many times. Did she love him so—and so—he asked. Ruth Mary, trembling, said she did not know. How could she help knowing? he demanded passionately. Had her thoughts been with him all winter as his had been with her? Had she looked up the river towards the hills where he was staying so long and wished for him, as he had gazed southward into the valleys many and many a day, longing for the sweet blue eyes of his little girl so far away?

Alas, Ruth Mary! She gazed almost wildly into his stricken face, distorted by the anguish of his great love and his great dread. She

wished that she were dead. There seemed no other way out of her trouble.

The next morning, before she was dressed, Enselman rode away and her father went with him.

She was alone now, in the midst of the hills she loved—alone as she would never be again. She foresaw that she would not have the strength to give that last blow to her faithful old friend,—the crushing blow that perfect truth demanded. Her tenderness was greater than her truth.

THE river was now swollen to its greatest volume. Its voice that had been the babble of a child, and the tumult of a boy, was now deep and heavy like the chest notes of a strong man. Instead of the sparkling ripple on the bar there was a continuous roar of yellow turbid water that could be heard a mile away. There had been no fording for six weeks, nor would be again until late summer. The useless boat lay in the shallow wash that filled the deep cut among the willows. The white sand beach was gone; heavy waves swirled past the banks and sent their eddies up into the channels of the hills to meet the streams of melted snow. Thunder-clouds chased each other about the mountains, or met in sudden downfalls of rain.

One sultry noon when the sun had come out hot on the hills, after a wet morning, Ruth Mary, at work in the shed room, heard a sound that drove the color from her cheek. She ran out and looked up the river, listening to a distant but ever increasing roar which could be heard above the incessant laboring of the waters over the bar. Above the summit of Sheep Mountain, as it seemed, a huge turban-shaped cloud had rolled itself up and from its central folds was discharging gray sheets of water that veered and slanted with the wind, but were always distinct in their density against the rain-charged atmosphere. How far away the floods were descending she did not know, but that they were coming, in a huge wall of water, overtaking and swallowing up the river's current, she was as sure as that she had been bred in the mountains.

Bare-headed, bare-armed as she was, without a backward look, she ran down the hill to the place where the boat was moored. Tommy was there sitting in the boat and making the shallow water splash, as he rocked from side to side.

"Get out, Tommy, and let me have her, quick!" Ruth Mary called to him.

Tommy looked at her stolidly and kept on rocking. "What you want with her?" he asked.

"Come out, for mercy's sake! Don't you *hear* it? There's a cloud-burst on the mountain."

Tommy listened. He did hear it, but he did not stir. "It'll be a bully thing to see when it comes. What you doin'?" You act like you was crazy," he exclaimed as Ruth Mary waded through the water and got into the boat.

"Tommy, you will kill me if you stop to talk! Don't you know the camp at Moor's Bridge? Go home and tell mother I've gone to give 'em warning."

Tommy was instantly sobered. "I'm going with you," he said. "You can't handle her alone in that current."

Ruth Mary, wild with the delay, every second of which might be the price of precious lives, seized Tommy in her arms, hugged him close and kissed him, and by main strength rolled him out into the water. He grasped the gunwale with both hands. "You're going to be drowned," he shrieked, as if she were already far away. She pushed off his hands and shot out into the current.

"Don't cry, Tommy, I'll get there somehow," she called back to him. She could not see anything for the first few minutes of her journey but his little wet, dismal figure toiling, sobbing, up the hill. It hurt her to have had to be rough with him. But all the while she sat upright, with her eyes on the current, plying her paddle right and left as rocks and driftwood and eddies were passed. She heard it coming, that distant roar from the hills, and prayed with beating heart that the wild current might carry her faster—faster—past the draggled willow copses—past the beds of black lava rock, and the bluffs with their patches of green moss livid in the sunshine—hurling along, past glimpses of the well-known trail she had followed dreamily on those peaceful rides she might never take again. The thought did not trouble her, only the fear that she might be overtaken before she reached the camp. For the waters were coming—or was it the wind that brought that dread sound so near! She dared not look round lest she should see through the gates of the cañon the black lifted head of the great wave, devouring the river behind her. How it would come swooping down between those high narrow walls of rock her heart stood still to think of! If the hills would but open and let it loose over the empty pastures—if the river would but hurry, hurry, hurry! She whispered the word to herself with frantic repetition, and the oncoming roar behind her echoed her whisper of fear with its awful response.

She trembled with joy as the cañon walls lowered and fell apart, and she saw the blessed plains, the low green flats and the willows, and the white tents of the camp safe in the sunshine. Now if she be given but one moment's grace to swing into the bank! The roar behind

her made her faint as she listened. For the first time she turned and looked back, and the cry of her despair went up and was lost, as boat and message and messenger were lost, —gone utterly, gorged, at one leap by the senseless flood.

At half past five o'clock that afternoon the men of the camp filed out of the tunnel along the new road-bed, with the low sunlight in their faces. It was "Saturday night," and the whole force was in good humor. As they tramped gayly along, tools and instruments glinting in the sun, word went down the line that something unusual had been going on by the river. There seemed to have been a wild uprising of its waters since they saw it last. Then a shout from those ahead proclaimed the disaster at the bridge. The Chinese cook, crouched among the rocks high up under the bluff, where he had fled for safety when he heard the waters coming, rushed down to them, with wild wavings and gabblings, to tell them of a catastrophe that was best described by its results. A few provisions were left them stored in a magazine under a rock on the hillside. They cooked their supper with the splinters of the ruined blacksmith's hut. After supper, in the clear, pink evening light they wandered about on the slippery rocks, seeking whatever fragments of their camp equipage the flood might have left them. Everything had been swept away, and tons of mud and gravel covered the little green meadow where their tents had stood. Kirkwood, straying on ahead of his comrades, came to the rocks below the bridge timbers, from which the awning had been torn away. The wet rocks glistened in the light, but there was a whiter gleam which caught his eye. He stooped and crawled under the timbers anchored in the bank, until he came to the spot of whiteness. Was this that fair young girl from the hills, dragged here by the waters in their cruel orgy, and then hidden by them as if in shame of their work? Kirkwood recognized the simple features, the meek eyes, wide open in the searching light. The mud that filled her garments had spared the pure young face. Kirkwood gazed into it reverently, but the passionate sacrifice, the useless warning, were sealed from him. She could not tell him why she was there.

The three young men watched in turn that night by the little motionless heap, covered by Kirkwood's coat. Kirkwood was very sad about Ruth Mary, yet he slept when his turn came.

In the morning they nailed together some boards into a long box. There was not a boat left on the river; fording was impossible. They could only take her home by the trail.

So once more Ruth Mary traveled that winding path, high in the sunlight, or low in the shade of the shore. A log of driftwood left by the great wave, slung on one side of a mule's pack saddle, balanced the rude coffin on the other. No one meeting the three engineers and their pack-mule filing down the trail would have known they were a funeral procession. But they were heavy-hearted as they rode along, and Kirkwood would fain it had not been his part to ride ahead and prepare the family at the ranch for their child's coming.

The mother, with Tommy and Angy hiding their faces against her, stood on the hill and watched for it, and broke into cries as the mule with its burden came in sight.

Kirkwood walked with them down the hill to meet it. His comrades dismounted, and the three young men, with heads uncovered, carried the coffin over the hill and set it down in the shed room. Then Tommy, in a burst of childish grief, made them know that this piteous sacrifice had been for them.

The tunnel made its way through the hill; the sinuous road-bed wound up the valley; new camps were built along its course. But when the young men sat together of an evening, and looked at the hills in the strange pink light, a spell of quietness rested upon them which no one tried to explain.

THE railroad has been built these two years. Every summer brings tourists up into the Bear River valley. They look with delight upon the mountain stream bounding down between the hills with the brightness of the morning on its breast.

"There should be an idyl or a legend to celebrate it," a pretty, dark-eyed girl, with a Boston accent, said to Kirkwood, one moonlight evening late in summer, when the river was low, as they drifted softly down between its dim shores. "Poor little Bear River, did nothing human ever happen near you to give you a place in poetry?"

The river did not answer as it rippled over the bar. Nor did Kirkwood speak for it; but the wood-dove's melancholy tremolo came from the misty willows by the shore; and in some suddenly illumined place in his memory he saw Ruth Mary sitting on the high bank in the peaceful afternoon, the sunshine resting on her smooth fair hair, the shadow lending its softness to her shy, down-bent face.

The pity of it, when he thinks of it sometimes, seems to him more than he can bear. Yet if Ruth Mary had still been there, at the ranch on the hills, she would have been to him only "that nice little girl of Tully's who married the one-eyed packer."

WHEN we turn from the makers of groups and reliefs to the makers of portraits, we enter a department of sculpture which is not less important, perhaps, but about which there is much less to be said. If the sculptor who treats an imaginative subject is bound to be a poet, the man who models a bust or a portrait-figure is no less bound to be a critic; and there is not so much that can be profitably said about criticism as about poetry. Of course the two gifts are found united in the same man. The poet is always a critic, and, though this is less clearly recognized, the good critic is sure to have something of the poet in his composition. In like measure, the imaginative sculptor of talent will make good busts, and the excellent portrait-sculptor will try his hand at the ideal, not always without success. But, notwithstanding this, we can generally divide the men into two classes. Nollekens remains in history as a great maker of busts, in spite of his many figures of Venus; and his contemporary Banks we recognize as an ideal sculptor, in spite of his intelligent and workmanlike portraits. Perhaps, in dealing with the men that make portraits, we may be allowed to use a word that is scarcely English, and call them "iconic" sculptors, from *εἰκόν*, an image. The French have helped themselves to this convenient adjective, and we may borrow it of them.

Let me, then, explain why I call the iconic sculptor a critic. It is because he has, first of all, to exercise upon his work the faculty of analysis. For instance, he is called upon to model the head of a man whom he has never seen before. If he is a clever, acute fellow, he will make a few inquiries about his sitter's antecedents, will talk with him a little, will gauge the surface of his mind, and will form a shrewd estimate of his character and capacity. It will occur to him, in every instance, to do this quite as much as a matter of course as to measure the features with the calipers, or to imitate the forms of the muscle upon the bone. This is criticism in its most superficial shape, but already how far is it removed from the practice of his fellow-craftsman, the imaginative sculptor. The latter, with his dream before him, is not occupied with the character or individuality of the model which sits to him. The handsome or beautiful figure which patiently adopts the attitude which he has seen

in his vision is a mere abstraction to him. This man or woman is a mere fragment of nature; the unmeaning forms before the sculptor have to be inspired by the breath of his genius. A girl who has nothing to say for herself poses for the vocal muse Urania; or behind the sleepy, sleek Italian model the artist has to divine the anger of Ajax. The iconic sculptor's method is the very reverse of this. He must see nothing more than his model gives him, or he fails; his business is to analyze, to criticise, that model as searchingly as he can. Hence it follows that while, as we saw in the former article, ideal sculpture has suffered almost total extinction during periods of centuries, iconic sculpture has at no time entirely ceased to exist. It seems, indeed, to have had no birth, to have sprung full-grown from the brain of the Egyptians. The earliest wooden portraits of Egypt are as full of character, as shrewdly and tenderly critical, as the best modern busts, and we need not be surprised at this comparative uniformity of merit in the best portraits of the world, when we reflect that though the ideals and aspirations of man differ widely in different ages, and his scales of invention rise and fall, man himself remains unaltered, and the same cares and hopes and passions score his features and expand his temples in each successive generation.

There can be no doubt that the work of the iconic sculptor varies in proportion to the weight of character in his sitter. I can fancy that Houdin would knit his brows less strenuously, and feel his heart beat less quickly, when he was called upon to model the head of His Majesty's Gold Stick in Waiting than when there sat before him the intellectual magnificence of Voltaire. But criticism is not all appreciation, and the good sculptor will impress upon his work the ravages of folly, vice, and weakness no less sturdily than those of virtue and brightness, if he finds them in the head before him. Nothing baffles him except the commonplace, and this he must condone as best he can, fortunate if some trick of movement, some accident of drapery, allows him to relieve the platitude that he dares not refuse to illustrate. There is one happy case in which the iconic sculptor can enjoy something of the freedom of the imaginative artist, and combine the excitement of creation with his proper function of analy-

* See Mr. Gosse's first paper on this subject in *THE CENTURY* for June, 1883.

sis. This is when he receives a commission to execute some great statesman or warrior or poet of the past, and must take his impression from tradition and from existing portraits, tempered by his study of the life and action of the man. In such a case he cannot be too reverent in his attitude toward his art, for all the obvious channels of instruction are closed to him. The living lips are not there to resolve his doubts, nor the living eyes to flash intelligence. In the absence of these it behooves him to employ all possible means to insure a moral and intellectual sympathy with his subject, and to let the soul shine through the mask of clay; and it is in such work as this, more than in the ordinary making of busts, that the man of genius will be found to distance the more painstaking craftsman of talent.

A sharp, incisive touch, knowledge what to emphasize and what to omit, the art to secure a portrait and yet to transfigure the mere resemblance with that indescribable quality which we call artistic value,—these are the great requirements of the iconic sculptor. The modern craving for realism has not been altogether beneficial to this class of sculpture. Many conscientious young artists, not ripe enough to be critics, occupy themselves so exclusively with the externals of their busts, with details of skin, and hair, and color, that they miss the first requirement of a head, namely, that it should be noticeable. The great busts of the world's art are irresistible; they hold us as we rush past them; they are as tenacious of our attention as the Ancient Mariner himself. A few years ago, at the French Salon, there was one such bust as this, the bronze head of the painter Baudry, by Paul Dubois. Here was an instance of one of the greatest of sculptors throwing his finest abilities into the task of analyzing the head of a great painter. As one gazed at it, one divined the life and character of Baudry; the long, resolute career of labor, the years of patient, brilliant painting, hung in air under the dome of the Opera House. I remember that as I was sitting to contemplate this bust, an American strolled by, caught sight of it, and after hovering round it for some time, came and sat by my side and watched it. Presently he turned and asked me if I could tell him whose it was, and whether it was thought much of, adding, with a charming modesty: "I don't know anything about art, but I found that I could not get past that head." The expression seemed to me to be as happy as it was naïve, and to express all that needs be said about a good bust. The sculptor, therefore, must remember that when his proportions are correct, his surface realis-

tic, his likeness excellent, there is still something left for him to do; he must give his bust that touch which will transform it into "a presence that is not to be put by."

Among those who have written English history in bronze and terra-cotta during the last twenty years, Mr. Joseph Edgar Boehm undoubtedly holds the most prominent place. His busts throng our galleries, his statues are frequent in our streets, and the palaces of our sporting and hunting aristocracy are still more rich in his memorials of their pleasures. He possesses a robust talent that betrays nothing of the foreigner, he is English to his fingertips, English even in his limitations and his prejudices. It is an idle thing nowadays to theorize on the effect of foreign invasion upon our national art. London, like Paris, has learned that the good artist who settles within her boundaries and makes her interests his, becomes an Englishman, and slips noiselessly into his place in the great national procession of talent. Mr. Boehm has had the gift to avail himself of this privilege. He came to England at a moment when sculpture with us was just ready for a transition. Gibson and Marochetti, with the false theories and feeble practice which they enforced, had passed the zenith of their fame, and were about to disappear. The feebleness of the one and the smoothness of the other, the lack of modeling power in both, must have inspired the youth fresh from the severe schools of Paris with contempt. He would find little to interest him in the Royal Academy; it would seem to him that busts were not to be made in the gentle manner of Weekes, nor ideal statues to be manufactured with the facility of McDowell. He would be, doubtless, a little blind to good work of a totally different school from his own which was being done outside the Academy and in defiance of its traditions. We need not dwell on all this, but consider him as an isolated figure, introduced to do good work of a distinctive character, to make Gibsons and McDowells impossible in the immediate future.

Mr. Boehm was born at Vienna in 1834. He is a Hungarian by birth and descent. In the National Museum at Pesth may be seen his terra-cotta bust of his father, Johann Daniel Boehm, who was a distinguished medalist in his time, and a long while Keeper of the Imperial Mint at Vienna. The son was destined from the first to be an artist, and after some preliminary study in Italy, was sent in his fourteenth year to London, to copy the marbles of the Parthenon. The course of work under the personal direction of Pheidias lasted three years, and left an indelible mark on the hand of the young sculptor, although

RACE-HORSE "CREMORNE." (BY JOSEPH EDGAR BOEHM.)

it cannot be said to have inspired him with any of the poetry of Greece. From 1851 to 1858 he worked steadily at Vienna as a medalist, and gained the *Kaiserpreis* for this species of sculpture in 1853. In 1859 he proceeded to Paris, and completed his education as a sculptor in 1862, when he came at the age of twenty-eight to settle in London.

He suffered but few trials, endured little patience or delay, but started almost at once on that career of prosperity on which he has risen steadily ever since. I believe I am correct in saying that in Mr. Thackeray he found an ardent friend, whose influence smoothed the way to fame and fortune. The Royal Academy of 1862 contained his first contribution, a terra-cotta bust of a gentleman; and in that of 1863 he was represented by a similar head. It was in 1864 that he revealed himself to the British public as a master. He was thirty years of age, in full possession of his powers, and he asserted his position in each one of those departments of sculpture by which he has made himself famous since. There are three provinces of art in which Mr. Boehm holds his own against all comers in England, three in each of which, when he is true to his powers, he is not excelled by any English sculptor. These are in busts, in portrait statuettes, and in equestrian groups. The exhibi-

tion of 1864 displayed his talent in all these three departments. It contained a charming statuette of Thackeray, who had died the year before (see *THE CENTURY* for February, 1881); it contained several striking busts, very bright and animated in expression, if, as the enemy asserted, somewhat wanting in distinction; and it also contained a race-horse in bronze and an equestrian statue which revealed a power of modeling animals which has not been equaled in England, though it has been surpassed in France by Barye, and in Germany by Julius Haehnel.

It is, however, as an animal sculptor that Mr. Boehm takes the highest place among English artists. Here he is unsurpassed, unapproached. His portrait-bronze of "Johnnie Armstrong" in 1864 was the first of a long series in which he has illustrated the heroes and heroines of the Derby and the Oaks. His strong personal sympathy with horses, and his practical knowledge of their "points," have prepared him to represent them with a modern exactness. It is not necessary to enjoy the personal acquaintance of Mr. Boehm to know that he is a connoisseur of horse-flesh. No figure is more familiar than his in our parks in the early morning; no one is better mounted or more at home in the saddle. It perhaps follows from all this that his

interest in the horse is not so much picturesque as professional; he regards the animal a little from the point of view of the turf. His admirers have naively assured us that he looks with contempt on those rough steeds upon which the youths of the Parthenon are riding to glory so majestically. He would not approve the young cart-horse on which Frémiet's Joan of Arc sits astride in the Place de Rivoli. He thinks a little more about "blood" than an artist should, and yet his portraits of the famous race-horses have a value which does not entirely depend upon their historical or genealogical accuracy. Mr. Boehm has produced several statues of horses which have enjoyed signal success. His "Suffolk Punch and Blacksmith" of 1869 was a group which must live in the minds of many for its vigor and for its grand acceptance of rugged forms in nature. As an illustration of this side of Mr. Boehm's genius, we engrave the latest of his equestrian groups, the race-horse "Cremorne." The refinement and delicacy of the nervous, highly strung creature are finely contrasted with the rigidity of the conceited old groom who walks beside, and who pinches a bit of the skin of his charge with an exquisite air of affectation. The whole group is as true and modern as possible, and in this sort of realism, not going very far, but perfect as far as it goes, Mr. Boehm has no equal in England. His bulls, lions, and tigers, which generally remind us slightly of the work of M. Cain, are not so thoroughly his own as his horses; but he executed a few years ago a seal, now placed as a fountain in the vestibule of Mr. Millais's house, which is a masterpiece of careful and accomplished observation.

Mr. Boehm has little interest in ideal work, properly so called, and has shown no desire to adapt modern life and modern motives to imaginative sculpture. It is said that he has executed some classical figures in the nude for the Royal Family, but he has not cared to exhibit them. All that he has exhibited in this poetic direction are a "Wilhelm and Lenore" in 1867, and a "St. George and the Dragon" in 1876. It is enough to say that these have not tempted us to regret his absorption in the graver practice of portraiture. His portrait-busts have frequently been admirable; we may say more than this, until the last few years they were almost always the best busts to be seen at the Royal Academy. He models with extraordinary skill, and this gift is seen to more advantage in his busts and smaller works, in which the work is entirely that of his own hands, than in his statues and monumental figures, where much of the labor of execution is left perforce to his pupils. His

popularity is so very great, and the mass of work which passes to him so overwhelming, that he is obliged to employ a great number of hands, and his succession of studios, full of workers, over which the eminent artist presides in all the fervor of his untiring energy, presents an aspect of business and of material success not to be found elsewhere among the sculptors of England. Since 1870, when he first exhibited royal subjects and a statue of the Queen, Mr. Boehm has sunned himself more and more in the rays of royal patronage. For some years he has avowedly been Sculptor in Ordinary to Her Majesty. But these honors are not always beneficial to those whose hearts are native to the republic of fine art, and some of us may venture to look back with regret to the work which Mr. Boehm produced before the world of fashion was at his feet.

The most remarkable statue which Mr. Boehm has produced, and that by which he is most widely known in the world of letters, is his figure of Carlyle, which adorns the Thames Embankment at Chelsea. This statue, first exhibited in plaster at the Royal Academy of 1875 and afterward in marble in 1882, forms the best, nay, perhaps the only truly satisfactory effigy of the master of pessimism. The attitude of the body, slouching and abandoned without being vulgar or ungraceful, suggests the action of Carlyle in the happiest manner possible, and the head, reflective and ferocious, modeled with great firmness and courage, seems to live in a moment of arrested intellectual action, between one outburst of loquacity and another. This figure made a great impression on the academicians, who had long resisted the claims of Mr. Boehm's candidature, and the death of Durham, in October, 1877, gave them an opportunity a few months later of electing the Hungarian sculptor to fill his place as an A. R. A. In 1883 Mr. Boehm was elected to be a full academician, and presented to the body, as his diploma work, a bust of Mr. Millais.

When Mr. Boehm took up his abode with us there was but one English sculptor who was financially enjoying a great success and yet was an honor to the profession. It has been a great misfortune in the history of sculpture that it is easy for a charlatan to impress his name on the public with vicarious work, produced no one can tell how or where. With the names of such impostors, past or present, these pages shall not be defaced. But Foley was a man of honorable genius who had actually succeeded in becoming prosperous and the center of a school. Twenty years ago his Irish warmth had attracted

BUST OF JAMES A. M. WHISTLER. (BY JOSEPH EDGAR BOEHM.)

around it about twenty assistants or pupils, who formed a group of active workers, that "school of Foley" of which we hear so often. These men were scattered at the death of the master in 1874; some of them have passed away, one or two of them have taken a start in a new direction. The majority retain the tradition of Foley in a rather tame and mediocre form. The man among them all who has asserted the greatest originality and has become most widely known as an independent artist is one of the youngest of them. Mr. Thomas Brock, A. R. A., was born at Worcester, in 1847. His father and his grandfather had been engaged in the decorative

arts, and he was early destined to follow in their footsteps. At the age of thirteen he won a medal in the local school of design in his native city, and he soon gained all the honors and all the knowledge that Worcester could offer to him. He was engaged for several years in the great porcelain works in that place; but the longing for a higher order of things became stronger and stronger, until at last, in his twentieth year, he found his way up to town, and knocked at the door of Foley's studio. While working there Mr. Brock passed through the schools of the Royal Academy, and won all the honors there in succession. After five years of probation he

SIR RICHARD TEMPLE. (BY THOMAS BROCK, A. R. A.)

became Foley's principal assistant, and remained in that somewhat arduous and responsible position until the master died of pleurisy, in the plenitude of his powers, in 1874. When Foley's will was read it was found that he had directed Mr. Brock to carry out the numerous and important commissions left uncompleted at his death. This seemed a very advantageous thing for the young sculptor left to carve out his own career, and, in not a few respects, there can be no doubt that it was beneficial to him. But the benefit was exaggerated, whether from the financial or the artistic point of view. From the former some of these commissions were so vast and so poorly paid that it required great prudence not to be ruined in their execution. The O'Connell monument at Dublin, which is now (in 1883) only just completed, is a work of colossal size, mainly in bronze, and required an outlay of capital in its preparation

which might have overwhelmed the young artist. Nor from the purely artistic side could the benefit be said to be more apparent. To be bound for years to carry out the designs of another man, however admirable that man may have been, is a most distressing and exhausting labor. It is like the ancient torture of being chained to a corpse. The young mind expands, sees nature from fresh points of view, is affected by new ideals, and all the while the hand is cramped in the act of following the dead master's indications with reverence. There has been, therefore, in Mr. Brock's career a certain period of eclipse, during which Foley, though in his grave, has repressed and overshadowed him to an extent which, in spite of his strong personal influence, would have been impossible during his lifetime.

Mr. Brock's first appearance at the Royal Academy was in 1868, when he sent the bust

"THE LAST CALL." (BY CHARLES B. BIRCH, A. R. A.)

of a gentleman to the exhibition. The next year he attracted some notice with a pretty female figure of "Salmacis," which possessed too much of that smoothness of surface and ineffectual ideality which were the bane of the school of Foley. But in 1870 he gave a very remarkable evidence of the genius that was in him, in the shape of a group of "Hercules strangling Antæus," which won the gold medal of the Royal Academy and a scholarship. This group has a singularly modern air, that is to say, it bears much more the impress of 1880 than of 1870. In a time when nobody in England thought about the French, when perhaps Mr. Brock had never visited the Salon, it possessed the vigorous vital qualities of French work. The body of Antæus is lifted into the air and crushed against the irresistible frame of Hercules, the strong limbs being paralyzed by a strength infinitely greater than their own. The group is much more than a mere academic study; in its science, in the fine treatment of surface and detail, it is already masterly, and remarkably free from the fatal Foley smoothness.

However, the atmosphere of Osnaburgh Street seems to have crushed his young ambition as completely, for the time being, as Hercules subdued the presumptuous Lybian giant. At all events, his original work during his last years of association with Foley has neither the freshness nor the importance of this early group.

For some years Mr. Brock was not a copious exhibitor at the Royal Academy. In 1873 he sent his admirable bust of Foley, and in 1875 two graceful Tennysonian statues in marble, a "Paris" and an "Ænone." Gradually he became known as a very accomplished sculptor of large public statues; in 1876 he put up a "Richard Baxter" at Kidderminster, and in 1880 "Raikes," the founder of Sunday-schools, on the Thames Embankment, statues which are as good as anything of the kind which we possess in England. Indeed it may be said without fear of contradiction that the best man now living for public work of this kind is Mr. Brock, whose long training under Foley taught him to estimate with peculiar adroitness the qualities needed by a figure in

"NOLI ME TANGERE." (BY GEORGE TINWORTH.)

coat and trousers under a murky sky. Mr. Brock has a curious way, peculiar to himself, of looking at his large statues, while he works on them, through an inverted opera-glass, the reduction of apparent size helping him to discover the relative value of ornament and detail.

His best-known and most popular group, the "Moment of Peril," which has been bought in bronze and placed in the national collection, was finished in plaster in 1880. It is the duel between a boa-constrictor and an Indian mounted on horseback, and illustrates the moment of arrested action, while the combatants regard each other. The incident is a little far-fetched, and the snake might have been more closely studied, but it is none the less a very powerful and important group, which attracted popular favor and secured for the artist his election as an associate of the Royal Academy, in the room of the late E. B. Stephens. Mr. Brock occupies the fine suit of studios in Osnaburgh Street, which have a certain historical interest, as being for so many years the scene of Foley's labors, and for many still previous the workshop of Behnes. One of these studios is let by Mr. Brock to Sir Frederick Leighton, who, when he indulges in his favorite art of sculpture, leaves his lovely mosque in the Melbury Road for an asylum where he, as the poet Gray puts it in one of his letters, can be happy and dirty to his heart's content.

One other sculptor identified with the

school of Foley must be mentioned in this brief survey. Mr. Charles B. Birch, A. R. A., was born in 1833, and therefore came under the influence of the great Irish master at an age more mature than did Mr. Brock. Mr. Birch, in fact, received his art-training in Berlin, under Rauch, and this German strain remains marked in his work, although it is modified by the tradition of Foley. Great delicacy and fidelity have been the qualities of Mr. Birch as an iconic sculptor. His heads of girls and women are always feminine, and sometimes possess a charm that is very refined and delightful. What he lacks is breadth; his large figures are often pleasing from their grace, but where his subject is recalcitrant and refuses a graceful rendering, Mr. Birch is apt to be feeble from lack of style. As a sculptor of a higher order than portraiture, it is difficult to define his position, because his failures have been numerous and yet his successes undeniable. In 1867 he exhibited a "Wood Nymph," embracing a fawn in her tender arms, which was simply exquisite, and in 1869 a "Whittington," which was of high merit. In each case the simplicity and elegance of youth found a sympathetic exponent. But unhappily, of late, Mr. Birch has adopted a martial bearing quite foreign to the nature of his talent, and persists in giving us dying hussars, trumpeters falling shot in their saddles, British heroes in tight uniforms taking singular attitudes of defiance. Our wars in India and Egypt have sadly

seduced him from that quiet idyllic field in which he once showed himself capable of excelling. But his portraits, especially his heads of women, retain their propriety and grace. Mr. Birch has been an associate of the Royal Academy since 1881, when he was elected to fill the vacancy formed by the promotion of Mr. Armstead.

Within a short time, the name of a sculptor who was known only to a few students, has been raised into wide notoriety. The exhibition of the works of George Tinworth, held in London during the spring and summer of 1883, called forth from all classes of the public, the illiterate as well as the cultivated, the involuntary praise which is enforced by work that is very strong

ognized his genius at once, he was able, without any further anxiety for the future, to pursue his own course and develop his own curious turn of mind.

That turn of mind is one of the most unique which has shown itself in our generation. There is no similarity between Tinworth and any other European sculptor that has flourished within the last three centuries. Without any plagiarism, and we may even say without any imitation, he belongs entirely to the Christian school of the early renaissance. He is almost Gothic, almost mediæval, in his simplicity, but he has the knowledge and the selective power of the fifteenth century in Italy and Germany. He has no interest in

"THE CITY OF REFUGE." (BY GEORGE TINWORTH.)

and new, and that yet appeals to the most obvious emotions of mankind. George Tinworth, who is a species of Adam Kraft or Peter Visscher born out of due time, is an artisan in the employment of Messrs. Doulton, the great potters of Lambeth. He was born in the squalid suburb of Walworth, south of the Thames, in 1843; his father was a broken-down wheelwright, his mother a decent woman who tried to struggle through her hard life by the comfortable light of her Bible. Her son grew up like herself, pious, grave, and thrifty, but with the additional and still rarer quality of original genius. In a volume on his life and works which has been published, the romance of his career is told at length; we learn by what strange accidents and happy coincidences he was put in the way of rescuing himself from the laborious and insecure trade of a wheelwright. He entered the Lambeth pottery in 1867, and under the almost paternal protection of the Messrs. Doulton, who rec-

anything which is not scriptural; with the solitary exception of a large panel suggested by a poem published in *THE CENTURY*, his subjects are taken from the Bible. And these hackneyed themes he treats with a freshness and a realism that are astounding. It is true that he cares nothing for preserving the Oriental or the Roman type, that his Pharisees are Walworth tradesmen and his centurions are Lambeth artisans under their disguises of costume; all this does not affect the vivid truth of the presentment, indeed by means of this reality he seizes the attention and touches the heart as he could do by no amount of correct archæology. His great panels, the work of his mature years, the "Going to Calvary," of 1879, the "Entry into Jerusalem" of 1880, the "Preparing for the Crucifixion" of 1881, and "The Release of Barabbas" of 1882, form a series of perhaps the very finest illustrations of the last hours of Christ which have been achieved by a

"LINUS." (BY E. ONSLOW FORD.)

modern artist. It is to be regretted that it is impossible, within our pages, to reproduce satisfactorily any one of these huge panels, crowded with figures in high relief, each one carefully studied, and steeped, as it were, in pathos and religious fervor. Our examples of Tinworth's work are taken rather from his earlier and much smaller and less ambitious work in terra-cotta. Of these slighter panels he produced a very great number before his hand had become thoroughly trained. His invention was for a long while ahead of his technical faculty, and his early works have the charm of sketches, but will not all bear to be analyzed by strict laws of the modeling art.

Tinworth's best and most mature sculpture dates from 1874 onward. In that year he finished a very elaborate and original "Descent from the Cross," which is now in the Museum of Science and Art at Edinburgh. The necessity of adapting his genius to the exigencies of architectural design seems to have had a chastening influence on his work, which at one time threatened to be over-

whelmed by a plethora of ingenious detail. His first large public work was a terra-cotta reredos for York Minster, which he carried out with marvelous spirit and success, under the architectural supervision of the late George Edmund Street, R. A. In Wells Cathedral a figure of David in high relief is Tinworth's, and dates from the same period. But the spot where his work in combination with architecture can best be studied, is the Guards' Chapel, in the barracks inclosure, on the south side of Bird Cage Walk. Visitors to London should boldly pass the sentry, who will not interfere with them, and cross the graveled yard to the door of the chapel, which is open to strangers all day long, though they very seldom seem to take advantage of the privilege. The interior of the old chapel is entirely new and is one of the most interesting monuments of what the third quarter of the nineteenth century has been able to do in the way of ecclesiastical decoration. The windows, the mosaics, the hexagonal marble panels by Mr. Armstead, all are worthy of careful examination, and certainly not least

the twenty-eight semicircular panels in terracotta, each illustrating a scriptural scene, which have been placed above each of the mosaics by Mr. Tinworth. These are, moreover, in low relief, whereas it is the custom of the sculptor to project his figures almost violently forward; and without laying down any law, it may be admitted that there is a greater satisfaction in looking at work that shows reserve than at that which seems striving to exceed the capacity of plastic work.

Mr. Tinworth has a large studio at the top of one of Messrs. Doulton's huge factories at Lambeth. After stumbling along dark corridors and up endless stairs, through rooms where the clay is flying from the potter's wheel, or being decorated by cheerful-looking girls intent over the soft gray urns that they tenderly handle, the visitor comes at last to the rough studio under the roof, where the sculptor is marshaling his clay figurines into some great frieze or sacred procession. If he makes an alteration in the visitor's presence, or illustrates his meaning with the soft lump in his hands, we wonder at the rapidity of his touch, the sureness of his vision, his wit and shrewdness. He is, as we have said, an artisan, and he has not cared to check the flow of his invention by troubling himself with what is called culture in any form. He can read the Bible, and he can model like some old craftsman of Nuremberg or Florence, and that is enough for him. He does not see that he can exhaust the great stories and scenes of Scripture history in one short life, but by taking heed he thinks that he can improve his own touch in modeling them, and his knowledge of their meaning, and this seems to him quite enough to have lived for. In our restless age, sick with unwholesome ambition, the modest attitude of this artist seems remarkable enough, and not easily to be overrated. There can be very little doubt that his name will be remembered among those of the most original men of our time.

Mr. E. Onslow Ford is a young sculptor of very great promise, whose name has first begun to come before the public within the last few years. It is almost certain that Mr. Ford is destined to be a prominent artist, but it would be rash as yet to say in what particular branch of sculpture. He was born in 1853. He began to study as a painter, and went to Munich for the purpose of working in the Academy of Arts in that place. He did not, however, feel much inspired by the tones of the German palette, and falling under the personal influence of the eminent Bavarian sculptor, Michael Wagnmüller, he formed a predilection for the plastic art. Wagnmüller, who, unfortunately, died quite

THE MARQUIS OF LORNE. (BY HENRIETTA MONTALBA.)

prematurely last year, was much in London in his youth, and indeed seemed likely at one time to add to the number of foreign sculptors who settle here and become Englishmen. His style is vigorous and individual, his treatment of drapery in heavy, almost rocky, folds giving his monumental statues an air which is quite their own. Mr. Ford did not exactly become Wagnmüller's pupil, but he worked in his neighborhood, and had the advantage of his advice. He returned to England, having married a young German baroness in Munich, and in 1875 he first exhibited at the Royal Academy, sending in a bust of this lady, which attracted the favorable notice of the profession. His technical skill has been steadily on the increase since then, but it was not until 1881, when he was successful in a competition for a statue of Sir Rowland Hill, that he really showed what he could do with a large figure. This statue, in bronze, now adorns the Royal Exchange, and in spite of the costume, which is not happy, is one of the best figures in our London streets. Upon this followed a "Sir Charles Reed," which stands in the School Board Office, and a "Mr. Gladstone," recently placed in the one vacant corner of the Reform Club vestibule. All these statues, but still more Mr. Ford's terra-cotta busts and ideal heads, have shown a very fine talent; but none of us, perhaps,

were quite prepared for the admirable science and vigor of his statue of "Henry Irving as *Hamlet*," in the Royal Academy of 1883. This statue, an engraving of which was given in this magazine for March, 1884, was distinctly the best of the year, and gave us the right to look forward with great pleasure to the further development of a talent so earnest and so genuine. Mr. Ford has hardly, however, had occasion to show us, until recently, what he can do in purely imaginative sculpture; the strenuous toil and exercise of taste and knowledge required to produce a really fine nude figure have, however, displayed themselves in a statue of "Linus," or the ancient Dirge impersonified, which adorned the Royal Academy of 1884. But Mr. Ford, in whose future we have the greatest confidence, will do even better things than this.

The physical strength required for the rough art of sculpture is too frequently denied to women to make the profession one which they can be expected commonly to adopt. Female sculptors have been rare in all periods of the world's history. Here in England, in the last century, we had the Hon. Mrs. Damer, a powerful and enthusiastic woman, who has left some creditable work behind her, and whose ambition it was to be supposed to chisel her own marble. In the generation which is now passing away, Mrs. Mary Thornycroft, mother of the sculptor, held the highest, almost the only, place given to women in the profession. She was the daughter of John Francis, himself an excellent iconic sculptor, and she exhibited, as M. Francis, so long ago as 1834. In 1842, after her marriage, she went to Rome and studied very seriously under Thorwaldsen. Her "*Sappho*" and her "*Sleeping Child*" were among the most popular works of the next decade, and she took rank, by general consent, among the first English sculptors. Looking back upon her works, which are

very numerous in our royal palaces, we find that they still hold their own against formidable rivals. Mrs. Thornycroft never possessed the knowledge or the masterly workmanship of Foley, but she has at least as much nature as McDowell, and a lively touch which was altogether absent in Gibson. Her portraits of children, and she has carved statues of perhaps every member of the Queen's family, are admirably graceful and vivacious; the best of all, and probably the masterpiece of her work in general, is her "*Girl with the Skipping-rope*." Mrs. Thornycroft has retired from the profession since 1875, when she exhibited, for the last time, statues of a daughter and of a grandson of the Queen. For forty years she was one of the most constant and abundant exhibitors at the annual show of the Royal Academy.

Since 1880 Miss Henrietta Montalba has been a prominent exhibitor of busts which have attracted attention from their realism and delicate force. She works entirely in terra-cotta, a substance which does not demand from women so heroic a labor as the manipulation of marble. Miss Henrietta Montalba is a younger sister of the famous water-color painter, Miss Clara Montalba. Both sisters began by studying painting under the veteran sea-painter, Eugène Isabey, now in his eighty-first year. Miss Henrietta Montalba then studied modeling under M. Dalou, while he was professor here in South Kensington. Her busts have still something of the Dalou touch, the reproduction of which, when not completely successful, is apt to be a little timorous and petty. She is, however, often entirely successful, not least in her children's heads, where she is unsurpassed in the delicacy with which she renders the tremulous forms and tender lines of the mouth and chin. Her last work is a capital head of Mr. Robert Browning.

Edmund Gosse.

THE NEW MOON.

THE new moon bends her golden sickle slow
Above the tree-tops, in the deep-blue west;
My heart's upswelling passions overflow
And will not let me rest.

Mysterious lady of refreshful night,
Ere thy thin horns in perfect circle meet,
Grant that my love her faith to me may plight,
And make my joy complete.

When in my hands her little hands I hold,
My heart beats fast for joy within my breast;—
O hide below the west thy curvèd gold,
Dear moon, and let me rest.

Arthur Platt.

DANGER AHEAD.

THE early American colonists were a homogeneous people. They spoke one language; they held substantially one and the same religious faith; they belonged to the same social order. They were at once men of thrift and men of industry; they were therefore all capitalists and all laborers. Their country was small; their means of intercommunication, though poor, were adequate; their interests were common; and the dangers which threatened them, now from a sterile soil or a hostile winter, now from barbarous neighbors, and now from their selfish and unnatural mother, bound them together and made then one. If the Huguenots of South Carolina, the pious cavaliers of Virginia, the devoted Roman Catholics of Maryland, and the sternly religious Puritans of New England could have been left undisturbed after the first century of their occupation in possession of the land of their adoption, their growth would have been slow, but it would have been natural; and the piety, probity, industry, and simplicity of these early colonists might have descended to their children and grandchildren with only such changes as are incident to all religious life. But this was not to be. The American Revolution forced the colonists into a united nation. The discovery of steam and the introduction of steam navigation facilitated immigration; the untold wealth of the country invited it. The rapid development of the mechanical arts facilitated the development of the country's wealth, but not its equal distribution. People from foreign lands poured across the bridged Atlantic in numbers so vast and in time so brief that their assimilation and nationalization were impossible. And now, a little more than one century from the Declaration of Independence, our empire comprises a territory already more extensive than that of the Roman empire in the period of its greatest grandeur, and a nation comprising people of every living language, every religious faith, every political opinion, and every social class; a country which two centuries ago had hardly a social rift, is now as full of social crevasses, broad and deep, as the snowy sides of the Alps; a country whose faith was so uniform and so simple that the congregational churches of New England thought it superfluous even to state it in formal creeds, has now on exhibition a greater assortment of religious opinions than is to be found in any other equal area upon the habitable globe; a nation in which

but one language was to be heard from Boston Bay to Savannah, boasts a single city in which all the German dialects can be heard in greater perfection than in any city of Germany.

I do not for an instant regret that these immigrants have come. Coming was their right. The earth is the Lord's and the fullness thereof, and no child of His has a right to exclude his brother from any nook or corner in the divine mansion because, forsooth, he got there first. The pilgrims of the sixteenth century have no better right here than the pilgrims of the nineteenth. Their coming is our benefit,—the wealth of the nation is in its men. No prohibitory tariff ever should and none ever can shut laborers out. They have built our railroads, cultivated our prairies, felled our forests, opened our mines, operated our mills, dug our gardens, and cooked, washed, and broken dishes in our kitchens. But the babe welcomed to the mother's breast brings a new burden to the mother's heart. And this new population, welcome as it is, brings with it both peril and duty,—peril to be escaped only by faithful performance of duty.

This vast immigrant population belongs for the most part to what we call the laboring classes; that is, they are wage-workers. They are generally without capital; often without education; almost always without culture; sometimes densely ignorant. They have never been taught the difficult art of self-government. Many of them are members of the Roman Catholic communion, which teaches one chief lesson to its communicants—to obey. They no sooner reach our shores than they begin to unlearn it. The power of the priesthood weakens; and Protestants, with a fatal folly, rejoice to see this power over reverence and fear grow daily less, though no reverence for God and no fear of conscience grow to take their place. Many of them are adherents of the Mormon hierarchy, which, though only half a century old, already over-spreads the entire South-west, an *imperium in imperio*, setting the laws of God and man alike at defiance and sweeping out the Christian home to make room for the Turkish harem. Still more of them come here having learned lessons of anarchy and revolt in their native land. Coming, many of them, from countries in which the church has been an instrument of priestly oppression, and the state an instrument of political oppression, they bring with them an inherited hate of both state and church; a disbelief in

THE SOCIALIST.

ENGRAVED BY T. JOHNSON, FROM THE PAINTING BY ROBERT KOEHLER.

man which is more dangerous to society even than that disbelief in God which always accompanies it. Freed from the restraints of the Old World, they are at the same time endowed with powers to which in the Old World they were utter strangers. In other lands the ballot is the privilege and prerogative of favored classes; here it is the recognized right of manhood. In other lands education, even when free, is under the control either of a religious or a political hierarchy; here to all classes is given that knowledge which is power, under no other regulations than such as the people in their several districts see fit to impose. In other lands meetings for discussion of abuses or the righting of wrongs have been under the surveillance of the police. In America words are as free as the air they are spoken in, and the gathering of men is as unrestrained as the flocking together of sparrows; and their chatter is sometimes as rude and boisterous. With these powers of ballot, of education, of free speech and free organization, modern science puts into their hands a power more dangerous than either, than all combined. With dynamite carried in a carpet-bag or contained in an easily concealed cartridge, the modern Guy Fawkes can destroy in an hour the products of a century's industry. In a warfare between classes for the possession of property, civilization has every advantage. In a warfare by anarchy against all property, the anarchist has every advantage.

Such is one aspect of the elements which threaten danger to society and the state. One-half our workers are wage-workers; one-third of our population, including the vast majority of our wage-workers, are either of foreign birth or children of foreign-born parents. They are restless and are growing more so. There is no power in any church to which they owe allegiance adequate to prevent an outbreak. There is no power in the state, no police, no military, capable of quelling it. Large numbers of them acknowledge no fealty to any religion which teaches them the duty or endows them with the power of self-restraint. The churches too often address not their conscience, but their imagination. The schools address not their conscience, but their intellect. Men who have been taught that modern order is despotism and modern property is theft, find themselves in a country where the only support of order is an enlightened conscience, and the only protection of property is an enlightened self-interest; and neither their conscience nor their self-interest is enlightened. Believing that property is theft, they believe that spoliation is redress; believing that the world's wealth is their inheritance of which they have been too long unjustly deprived,

they are ready with no gentle voice to demand of society, "Give me the portion of goods that falleth to me"; and we may be sure that if it were given to them it would soon be spent in riotous living not followed by repentance and a request for employment as hired servants.

Two other facts must be added to these which I have so rapidly sketched:

1. Labor is organizing for the protection of its interests. It is thus deepening the chasm and intensifying the hostility between the laboring class and the capitalist. Nearly every trade has now its trades-union,—some local, some national. They exist in every State of the Union, except Florida, and in most of the territories. The annual income of the larger unions has ranged from five thousand to fifteen thousand dollars. Of their full membership there is no adequate census. A coalition has been formed, not yet fully perfected, for the union of them all in one confederation. Agriculture is the only considerable industry which has not its industrial organization. These unions are essentially warlike, both in their aims and in their methods. Let me explain what I mean by that assertion. Commercial organizations may be rudely divided into two classes: those for the promotion of industry, and those for the protection of rights. The former are industrial; the latter are military. All corporations, co-operative societies, associations for amicable discussion of mutual interest, are of the first description; all trades-unions are of the second. They give aid to their members in case of sickness or inability to work; and are in so far philanthropical. They have lodge rooms, with meetings for reading, debate, and mutual improvement, and in so far are educational. But the reason for their existence is self-protection. They are not organized to promote education in their several industries; to facilitate apprenticeship; to introduce new and improved methods; to encourage the introduction of labor-saving machines; to equalize wages by equalizing intelligence and industry. On the contrary, apprenticeship is discouraged, new methods are obstructed, the introduction of labor-saving machinery has been more than once made the occasion of a strike, and the equalizing of wages is attempted by leveling down, not by leveling up. The trades-union is not organized, like a political club, for purposes of persuasion, nor, like a literary club, for purposes of education, nor, like a coöperative club, for purposes of industrial benefit; it is organized to protect its members against the oppression of employers, or to wrest from employers a larger share of the profits. It is founded on the assumption that the interests of employer and employed are antagonistic;

and that combination is necessary to protect the employed from their employers. As it is essentially military in its aims, so also is it in its structure. It is ruled over by a directory scarcely less absolute than that which governed the revolutionists in the days of Mirabeau. This directory sits in secret, issues its orders, demands implicit obedience, and enforces it by industrial excommunication, and often by open violence or secret assault. A condition of society in which the working class is leagued together in a clan whose hostility to employers is not concealed, whose watchword is absolute obedience to the decrees of chiefs, whose designs are perfected in secret conferences, whose tendency, and sometimes whose aim, is to widen the chasm between classes, is a dangerous condition; the danger is but hinted at in frequent strikes often accompanied with violence, occasionally bursting forth in rioting, and once flaming out into a national conflagration. Every new strike, whether it succeeds or fails, widens the chasm and increases the danger.

But trades-unions are organizations of honest workmen who desire only fair wages for fair work; who submit to the despotism of a military organization because it is less despotic than that of the capitalist with whom they believe themselves to be at war. But there are other organizations of working-men in America, men who do not conceal their belief that property is theft and robbery is righteousness. In September, 1883, a procession of over ten thousand so-called working-men marched through the streets of New York city, bearing on their banners such inscriptions as, "Workers in tenement houses — idlers in brown-stone fronts"; "Which shall it be, the ballot or Judge Lynch?" A like procession is perpetually marching through the United States in constantly augmenting numbers. Its journals are its banners; for its mottoes, read these sentences gathered from their editorial utterances:

"When the laboring man understands that the heaven which they are promised hereafter is but a mirage, they will knock at the door of the wealthy robber with a musket in hand, and demand their share of the goods of this life now."—"Religion, authority, and the state are all carved out of the same piece of wood — to the devil with them all."—"Hurrah for science! Hurrah for dynamite! The power which in our hands shall make an end to tyranny."—"Truth is five cents a copy; and dynamite is fifty cents a pound."—"Judge Lynch is the best and cheapest court in the land."—"The revolutionist knows only one science — namely, destruction."

Every successful journal is the representative of thousands of readers; the three journals from which I have quoted the above represent each a platoon in the great army. This is the vanguard. A greater army follows,

led it knows not by whom, marching it knows not whither.

While working-men are thus combining in military organizations for either offensive or defensive warfare, the progress of civilization, facilities of locomotion, labor-saving machinery, and the substitution of associated for individual industry, incident to the increased and increasing division of labor, are bringing them together in compact communities, where there are more living to the acre than there are corpses in our burying-grounds, where liquor shops are many and churches are few, where there is every facility for vicious combination and every stimulant to vicious growth, where the home perishes of asphyxia, and the swarming tenement grows rank.

In 1848 Alexis de Tocqueville wrote the following prophetic words: "I look upon the size of certain American cities, and especially on the nature of their population, as a real danger which threatens the future security of the republics of the New World; and I venture to predict that they will perish from this circumstance, unless the government succeeds in creating an armed force, which, while it remains under the control of the majority of the nation, will be independent of the town population, and able to repress its excesses."

When Tocqueville wrote that warning, there were but two cities in the Union with a population exceeding 200,000; there are now eight. Then seven-eighths of the population lived in the country or in country towns; now nearly one-quarter live in large cities.* Then the industry of the nation was still mainly agricultural; now mining and manufacturing have combined with immigration to change the nature of labor, and the character of the laborer. Then communism was almost unknown; now Proudhon's aphorism "Property is theft" is the fundamental doctrine of organizations, fatally prolific in their natural nests the great cities, and with the destructive instruments which modern science has put into their hands, threatening civilization in Germany, France, Great Britain, and the United States. This dangerous element does not lack for leaders as dangerous. Every king has his courtiers. The worse the despot the more despicable the sycophants who fawn upon him, and affect to reverence while they really direct his powers. The American demagogue is the courtier of American mobocracy; and never did baser courtier flatter and fawn upon more dangerous king.

2. If labor had no just cause of complaint we might look upon its organization, whether in peaceful or in revolutionary forms, without fear; for any cause which has the conscience of

* Of over 8000 population.

humanity for its ally is sure of victory. But labor has a cause of complaint, a serious cause of complaint. While the laborers in America have been organizing an army, the great body for defensive warfare, the vanguard for attack, a steady concentration of capital in the hands of a diminishing number of capitalists has been taking place. A youth starts in life as a deck-hand on a river steamer; in half a century he has amassed a fortune of seventy millions. Another begins life with a mouse-trap; in twenty-seven years he exhibits securities worth a hundred millions. Society is a joint stock concern. These are the profits which these two railroad kings have taken from it? Have they earned them? Do the seventy millions in the one case and the hundred millions in the other represent what they have added to the common stock?

We brought nothing into this world; that is very certain. What, then, any man possesses he has either produced by his industry or has taken from some one else who has produced it by industry. His fortune is either: first, the product of his industry; second, a gift; or third, a robbery. These are the only three ways by which any man can ever acquire property,—by industry, by gift, and by stealing. There will always be inequalities in condition because there will always be inequalities in character. The industrious man has a right to the fruits of his industry; the sagacious man has a right to the fruits of his sagacity; but no man has a right to take the fruits of his neighbor's industry or his neighbor's sagacity without giving an equivalent therefor. No man has a right to take out of the joint stock more than he puts in. And society is organized in the interest of robbery whenever it is so organized as to enable men by their sagacity to take out of the world wealth whose equivalent they have never put into the world. This is the complaint, and the just complaint, of the laboring classes,—not that some men get better pay than other men, but that some men get a wealth which does not belong to them, which does belong to their neighbors; that some forms of robbery are legalized; that some forms of robbery are encouraged and stimulated. That the railroad president should have ten or twenty thousand dollars a year for his service, and the brakeman but five hundred dollars a year for his, would arouse little complaint; but that the speculator in railroad stocks should realize four millions of dollars a year for his services and the brakeman five hundred dollars for his, does arouse a well-grounded complaint. And the bitterness of the complaint is increased because the brakeman sees, dimly if not clearly, that the inequality is due not to difference in intellectual qualifications, but to

injustice in social organization. Grant that a certain capitalist has added every year of his life a million dollars to the wealth of the nation by his industry, his sagacity, his forecast, the other seventy-three million dollars which he has won in life's lottery are unearned; and unearned wealth is stolen wealth. Certain people in the United States are seventy-three million dollars poorer because he has seventy-three million dollars for which he has given society no equivalent. This is the brakeman's argument. If he is in error, his error must be shown him. An inequality of wealth is not wrong; but an inequality of wealth greater than the inequality of industry is wrong. Two "railway kings" have gone into partnership with Tom, Dick, and Harry to develop the mines and open the railroads of a great district of country. Tom, Dick, and Harry do not complain that the railway kings are better paid than they; they do complain that the railway kings have taken more than their share of the profits of the enterprise. And bitterness is added to their complaint because they see more or less clearly that society is responsible; that the terms of partnership are unfair; that legislation gives to capital every advantage and leaves labor to shift for itself. They see, more or less clearly, that this money has been made not by individual industry, but by gambling; and that this gambling has been made possible by means of great corporations.* These corporations are organizations created by society in the interest of capital, and for the avowed purpose of increasing its profits. They are a contrivance for the concentration of the wealth of many men in a few hands, in order to increase its power and enhance the facility of its administration. These corporations are already a power in the state greater than the state itself. They control the United States Senate if not the United States House of Representatives, and the legislatures of several of our States. They have autocratic powers bestowed upon them. They fix the rates of transportation of goods and passengers; they determine the conditions on which and the prices at which telegraphic communication may be carried on between different parts of the country; they are absolute masters both of the nerves and the arteries of the body politic. The combined wealth of the railroad corporations counts by billions; their annual income by hundred millions; their interests are combined in pools and syndicates. Against them private citizens are almost power-

* Washington Gladden has recently stated in the pages of *THE CENTURY* that the amount of wealth transferred by their gambling operations in a year in Wall Street is estimated to aggregate \$800,000,000.

less; the workman must take what work they will furnish at what wages they will give; the shipper must pay what freights they charge. If any complaint is made, the complainant is recommended to go elsewhere; as if one syndicate should control the globe, and a complaining citizen should be told to try his fortunes on some other planet.

The stocks of these great corporations are turned into dice, by which gigantic gambling operations are carried on, operations in which fortunes are lost and made in a day, operations by which honest men are tempted from honest industry to their ruin; and other honest men who resist the temptation are involved in the ruin which a common wreck inflicts upon the community. As if this were not enough, the brakeman sees these great corporations the recipients not only of vast powers, but of gifts as vast. He sees the nation giving away to these railroad companies an area nearly equal to the great States of Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa, and Missouri; and three times the total area of England, Ireland, Scotland, and Wales. He is told, indeed, that this has been given in alternate sections, and is urged to believe that the appreciation in value of what remains is an adequate equivalent for what has been given away. But he sees no definite and appreciable advantage accruing to himself; and he sees the recipients of the nation's landed wealth becoming by its means millionaires in a lifetime. If there be any advantage to him, it is remote, intangible, unseen. This great domain belonging in part to him he sees conferred by legislation on one class of capitalists; he sees other capitalists, less scrupulous, pushing their way into our Western territory, and taking its best estate without leave or license; he is told by official reports from Congress that millions of acres have been fenced in by domestic and foreign lords, and converted into feudal estates, defended alike against lawlessness and against representatives of the law by cow-boy retainers. In the grip of this great mercenary power the laborer is powerless; against its injustice when it is unjust he has no remedy; and for his constantly diminishing wages modern political economy suggests no better relief than a tax on all foreign importations, that the price of every article bought, every garment worn, every utensil used may be increased, and some small portion of the increase be added to his slender income. Thus far the rapid increase of property and wealth in a new country of almost illimitable resources makes light the burden of his life. But every year the burden grows greater and the danger of revolt more threatening. The low growl of the thunder is already to

be heard in great cities; the lambent flame already runs along the clouds; the bitter cry of outcast London is faintly echoed from New York and Cincinnati, from Chicago and St. Louis, and from a hundred smaller manufacturing towns and mining villages. It grows not fainter but louder. *Elisée Reclus* tells us that the average mortality among the well-to-do is one to sixty; that in Europe it is three times as great; that every year ten million people die who, in a well-ordered social condition, should have lived. Think what that means, and wonder not, as wealth increases and poverty increases, and the rift between the poor and the rich grows wider, that many a thoughtful *Curtius* begins to ask where Rome shall find a jewel precious enough to be cast in and save the city from being swallowed up.

On the one side of a narrow valley capital is concentrating its forces, small in numbers but compact in organization, powerful in equipment, and not always either scrupulous in its means or generous in its spirit. On the other side, labor is concentrating its forces,—an increasing host, loose in organization, but with a discontent in its heart which a great disaster might easily convert into bitter wrath,—armed by modern science with fatally efficient equipment for destruction, and officered by leaders often both unscrupulous and daring. Every morning paper brings us the report of some strike or lockout, which is like the shot of a single picket along the line; and now and then we are startled by a riot such as that at Cincinnati, Chicago, or Cleveland, which is like a skirmish between the advance guards. Who can tell that the next skirmish may not bring on a battle?

So far I have written as a pessimist. I should be a pessimist if I were not a believer in Christianity. Let me briefly indicate the direction in which we are to look and labor for the protection of our industries, our homes, and our land from this danger ahead.

Certainly not by the remedy which *Tocqueville* suggested. One-quarter of the population of America lives in cities. The other three-quarters will not leave their peaceful vocations to serve as city police. The farmer will not leave his plow in the half-turned furrow to protect the palace of the city prince from pillage by the city mob. Repression is not remedy. We cannot suppress this growing discontent; we must remove its cause. We cannot maintain both a free republic and a standing army; therefore, we cannot maintain a free republic by a standing army. We cannot learn from the Old World how to repress the disorders which threaten both worlds. The ruins of the *Louvre* attest the monumental folly of the endeavor of imperialism — no matter how

disguised—to leave wrongs unrighted, and prevent revolution by an armed force. All that we can learn from Alexander III., Bismarck, and the two Napoleons is, how not to do it. Not by making America less democratic, but by making it more so, are we to perpetuate the republic.

Politically America is a democracy; industrially America is an aristocracy. The community which allows the laborer to determine the destinies of the nation, allows him no voice in determining the nature or the profits of his own industry. He *makes* political laws; he is *under* industrial laws. At the ballot box he is a king; in the factory he is a servant, sometimes a slave. Men who make legislators, governors, judges, presidents, are not allowed to determine how many hours a day they will work, and are able to determine what wages they shall receive only by organizing into an unarmed militia to preserve that right. The community at the same moment puts a ballot *into* the hand, and a manacle *upon* it. We must either take the ballot out or the manacle off. If humanity has a capacity such that it can carry on the affairs and direct the destinies of an empire, it has a capacity such that it can carry on the affairs and direct the destinies of a coöperative corporation. It is estimated by political economists that to carry on any large organized industry requires an average capital of \$1000 for every working-man employed. This requires a large capital when it is furnished by a single man; but it is not a large capital when it is divided up among one thousand working-men. A healthy, thrifty, energetic, industrious, sober mechanic ought to be able to lay up \$1000 before he is gray-haired; and this makes him a capitalist. A hundred such would have in their savings capital enough to inaugurate a successful industry, and ought to have brains enough to conduct it. Coöperation is the first step toward the redemption of labor from the oppression of capital. And coöperation has been proved pecuniarily practicable. At the annual meeting of the English Coöperative Congress, held at Derby last year, the statistics for 1882 were presented. Coöperative production has been a failure (perhaps I should say, rather, has not been a success; it still exists, though on a small scale), because the working-men have not yet the self-denial to hold themselves back from over-production and live on small profits when there is small demand for their labor. They require a "boss" to cut their wages down. But coöperative distribution has been a marvelous success. The figures are significantly eloquent: 1346 societies; a membership of 661,000; an

aggregate capital of \$38,000,000; a gross business for the year of \$130,000,000; a profit of \$10,500,000, or twenty-six per cent. on the investment,—these figures show what the democracy of labor can achieve under favorable conditions and wise direction. They indicate the direction in which humanity is to seek for safety from the danger ahead.

I wish I had the ear of the working-men's organizations. I would put these figures before them, and then I would address them in some such terms as the following:

Do you not see the fatal defect of all your organizations? You combine only that you may not work. In one summer's telegraphic strike you spent \$400,000 for the right to be idle. Why did you not expend it for the right to be independent? Half a million dollars, plus all the best telegraphic talent in the United States, with the sympathies of the nation as a reserve, combined to establish postal telegraphy, might have given you success instead of failure. Strike, not for better wages in servitude, but for independence. Organize not to be idle, but to be busy. Combine not against your employers, but that you may employ yourselves. You battle not for the rights of labor, but for the right not to labor; it is a barren, fruitless right not worth fighting for. Victory is as bad as defeat. For combination put coöperation; for few hours and fair wages put independence; for a right to be idle put power to work. Make yourselves capitalists, combine your capital with your industry, and add to it by your credit, and so become your own masters.

The conflict between labor and capital can be and is ameliorated by every influence which tends to produce kindly feeling between the two. America is at least partly protected from the revolutions such as destroyed Rome and ravaged France; for America has what neither Rome nor France possessed—Protestant Christianity. But kindly feeling can only give a truce, not peace. Peace will come only with a completion of the progress of democracy—only with the final triumph of what I may call social and organic Christianity,—only when an industrial democracy is organized, identical in its principles and its spirit with the political and religious democracy which already characterizes our country,—only by processes which will convert the laborer himself into a capitalist and endow him with the power, the intelligence, and the virtue to be his own master. The first step in this process is coöperation. The first contribution to it is a broader, better, more universal, and more practical education.

The second step is a new conception of the functions of government and consequent en-

largement of its powers, and the sphere of its operations. The first governmental organizations are military, for protection of the community from enemies without. The organization is that of an army, the king is the commander-in-chief, the authority is despotic; for the authority of a military organization always must be despotic. The second step in the development of government makes it a great police force. The enemies which threaten it are no longer from without, but from within; its magistrates and its constabulary are its regular police, its militia is its *posse comitatus*. Rebellion is simply an enormous riot; and when the citizens have put it down, they disarm and go back to their peaceful vocations. This is the epoch in political history of *laissez faire*. This is Jeffersonian democracy. This is as far in history as Herbert Spencer and Professor Sumner have gone. The function, the sole function of government is thought to be protection; social classes owe nothing to one another, and each individual is left to make what he can out of the world or to be crushed by it, as may happen. Its motto is every man for himself and the devil take the hindmost. It is organic selfishness. But there is a third epoch in the history of mankind; an epoch in which government is neither a military nor a police organization, but a great industrial corporation; in which it becomes a league of men combined not for the protection of the community from enemies without, nor for the protection of the individual from enemies within, but for the better development of its wealth, the better reward of its industry, the better promotion of its welfare. On this epoch we have entered. We shall not turn back; neither Herbert Spencer nor Professor Sumner can stay the forward march of humanity. Modern governments are already great industrial corporations. In Belgium government operates the railroads; in England it does the express and telegraph business; in America it is an enormous banker. The more democratic the government, the more enlarged are its functions. Free government establishes libraries, constructs and endows a magnificent school system; maintains sewage; compels unwilling parents to vaccinate their children; regulates the size and structure of houses; in short, does a hundred things which a mere state police has no right to do, but which a great cooperative industrial organization may fitly and wisely do for itself. What it thinks itself incompetent to do, it calls on others to do for it; and creates great corporations to furnish it with coal, with means of communication, with currency, corporations on whom it confers almost autocratic powers, to whom it gives enormous compensation, and whom, in judicial decisions recently announced, it is just beginning to recognize as public servants, deriving all their powers from the people, and to them amenable for the just exercise of their powers. In so far as what we call communism is a tendency toward the realization of this enlarged conception of government as a great industrial organism, it is a tendency to be carefully guided and directed, not to be condemned and repressed. I shall not attempt to enter upon this branch of the subject, except by way of suggestion,—partly because the topic is too large and the space too limited, partly because my object in this article is to start the reader to thinking rather than to think for him. I have no desire to do more than suggest the direction in which he may think to advantage. And this may best be done by reporting without note or comment three facts for his consideration:

1. Three or four years after the British Government had secured the ownership and control of the telegraph lines of Great Britain, the following results of its administration were ascertained: the number of offices for business had increased thirty per cent.; the number of messages fifty per cent.; the number of words sent two hundred per cent.; the cost of sending had been reduced forty per cent.; and it had actually cost the government nothing, for it borrowed the money for the enterprise at three per cent., and the profits of the business were four and three-tenths per cent. Government in England can conduct a great telegraphic enterprise for the people better than private enterprise. If government in America cannot, it is time that we found out the reason why.
2. The Erie Canal, the great highway of commerce before railroads were in operation, had cost this State a few years ago, in capital, in interest, in repairs, in administration, two hundred and thirty millions of dollars; it had brought into the State two hundred and twenty-one millions of dollars; and the people still own the canal. If we can own, administer, and control a great waterway, why not a great ironway?
3. A few years ago we wanted to build a railroad from the Missouri to the Pacific Ocean. We did not think we could undertake that work ourselves as a government. We asked some private capitalists to do it for us. They generously consented. We gave them for their generosity great gifts of land, and loaned them thirty-three millions of dollars in bonds, for which we stand responsible to-day. They borrowed seventeen millions elsewhere and built the road; it cost them fifty millions. Three-fifths of the cost of the Union Pacific we

paid out of our own pockets, and we do not own the road nor any share of it. A few years ago England wanted a railway in India. She invited capitalists to build it for her, and guaranteed the capitalists five per cent. on their money. They built the road; England has a representative in its direction; she receives an income of seven per cent., pays the capitalists

the guaranteed five per cent., and the two per cent. profit has enabled her to abolish the income tax in India. If England can do this in India, why cannot we do it in America?

These three questions I leave the readers of this article to ponder and answer to themselves, at their leisure.

Lyman Abbott.

GIFTS.

"Oh, World-God, give me Wealth!" the Egyptian cried.
His prayer was granted. High as heaven, behold
Palace and pyramid; the brimming tide
Of lavish Nile washed all his land with gold.
Armies of slaves toiled ant-wise at his feet,
World-circling traffic roared through mart and street.
His priests were gods, his spice-balmed kings enshrined,
Set death at naught in rock-ribbed charnels deep.
Seek Pharaoh's race to-day and ye shall find
Rust and the moth, silence and dusty sleep.

"Oh, World-God, give me Beauty!" cried the Greek.
His prayer was granted. All the earth became
Plastic and vocal to his sense; each peak,
Each grove, each stream, quick with Promethean flame,
Peopled the world with imaged grace and light.
The lyre was his, and his the breathing might
Of the immortal marble, his the play
Of diamond-pointed thought and golden tongue.
Go seek the sunshine-race, ye find to-day
A broken column and a lute unstrung.

"Oh, World-God, give me Power!" the Roman cried.
His prayer was granted. The vast world was chained
A captive to the chariot of his pride.
The blood of myriad provinces was drained
To feed that fierce, insatiable red heart.
Invulnerably bulwarked every part
With serried legions and with close-meshed Code.
Within, the burrowing worm had gnawed its home.
A roofless ruin stands where once abode
The imperial race of everlasting Rome.

"Oh, Godhead, give me Truth!" the Hebrew cried.
His prayer was granted; he became the slave
Of the Idea, a pilgrim far and wide,
Cursed, hated, spurned, and scourged with none to save.
The Pharaohs knew him, and when Greece beheld,
His wisdom wore the hoary crown of Eld.
Beauty he hath forsworn and wealth and power.
Seek him to-day, and find in every land.
No fire consumes him, neither floods devour,
Immortal through the lamp within his hand.

Emma Lazarus.

JOHN BODEWIN'S TESTIMONY.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "Friend Barton's Concern," etc.

I.

IN THE BURNT WOODS.

THE western slope of the Park range, as it sinks into the valley of the Arkansas, is clothed to the timber-line with monotonous forests of pine and fir. In winter this dark zone of trees looks darker for the zone of snows above it; in spring the patches of sunlight on the mountain-side bring out a paler and more vivid green; the lower gulches, lined with aspens, in autumn show a streak of faded gold; but at all seasons, from the highest of the mountain's lights to the deepest of its shadows, the range of color is slight.

The deepest shadow on the mountains is one which does not change with the seasons or pass with the clouds. It covers an area of many acres. Within its limits the trees are still standing, but leafless and blackened from root to crown. They are the unburied dead which the forest fires have left on the field after one of their wild forays. In the course of years the wind will flay them and the snows will bleach them to the grayish whiteness of old bones. But in the summer of 187-, when the Eagle Bird and Uinta lode claims were first discovered, the burnt woods which covered them had but just met their fate. Each separate tree was an effigy of desolation, uplifting its charred and rigid limbs as if in mute attestation of its wrongs. The wind could get no more music out of them; the few birds which nested so far above the valley forsook their branches; the traveler missed their spicy shade. They could offer no longer either rest, shelter, or concealment to any living creature. But their neighborhood was as good as any other for the location of a mine.

Colonel Harkins, the owner of the Eagle Bird and the Uinta, did not trouble himself about his environment. He looked about him and saw that the dead trees were fit for fuel, if not for building and the timbering of shafts. He saw that the slope of the hill was sufficient for drainage, and for the future ore-dumps of unknown value to lean their cone-shaped mounds against. He reckoned the cost of a wagon-road to the nearest camp two miles away, which formed the nucleus of many lesser camps and outlying mines scattered far and

near along the sides of the range or concealed in the folds of its forest garment.

An old hunter's and prospector's trail, starting in the valley, took its way deviously but always upwards in the direction of the pass. A short distance beyond the two claims it was joined by a trail from the camp. Thus the new mines, though lonely in their situation, were not inaccessible.

ONE afternoon, about four o'clock, a man came out of the Eagle Bird tunnel, extinguished his candle as its rays turned sickly in the daylight, and, mounting his horse, followed the trail which led onward into the forest. The sun stood nearly opposite across the valley, and he raised his hand to his hat-brim, as if blinded by the glare. He sat his horse easily, lounging a little forward after the manner of men who spend many hours in the saddle in solitary, uneventful journeyings. He was a youngish, slenderly made man, with a distinctly good bearing. Even as he jogged along on his bald-faced bay in the bleak, untempered light, you felt that he was one whom life had refined and sobered, if it had not distinguished him with any great measure of joy or of success. His thin, smooth cheeks were darkly tanned; the close-shorn, light-brown hair, without a trace of gold in it, showed by its difference of texture rather than color against his temples and neck. His hands were the slender, pointed hands which go with a supple, small-jointed frame. His beauty, in fact, what there was of it, consisted chiefly in this harmony of parts, uniting in a personality unique but singularly unaggressive. The rider's name was John Bodewin.

The trail, now turning away from the valley, gave him the benefit of his own shadow opposed to the sun. Its broad light streamed before him into the forest and shone full in the faces of two people at a little distance from him, who had turned at the sound of his horse's feet,— a middle-aged gentleman, seated in a rather disconsolate attitude on the smooth, barkless trunk of a fallen tree, and a young lady in a riding-habit, who stood near him and was speaking to him when Bodewin saw them first. The gentleman was of stout proportions and fresh complexion, intensified by a recent coat of sunburn. Bodewin recognized

Mr. Newbold at once ; the dark-eyed girl beside him was presumably Mr. Newbold's daughter.

"Did you ever know anything so still as this place?" she had been saying. "I cannot hear a sound except that horse's tread. Some one is coming who is in no hurry, it seems."

A moment later Bodewin appeared at the turn of the trail.

"He's in no hurry," Mr. Newbold remarked, sulkily, eying the horseman's approach, "if he takes his own business as coolly as he does other people's."

"Do you know him, papa?" the girl asked in surprise. Bodewin had welcomed the sight of a fair woman in the forest, and involuntarily paid it the homage of a more erect seat in his saddle, and a hasty restoration of his hat from the angle of comfort on a hot afternoon with the sun on the back of one's neck, to the level of decorum under all circumstances. He passed the group at his horse's slowest walk.

"How d'you do, Bodewin? Still here, you see," Mr. Newbold said, touching his hat to him.

Bodewin made some civil though inaudible reply. He had a speaking acquaintance with Mr. Newbold, but he could hardly have been surprised to see him there or elsewhere, since that gentleman's system of movements was quite unknown to him.

Miss Newbold had been two weeks in the camp, and Bodewin had not sought to see her or be presented to her for reasons personal, referring to her father, and local, referring to the city of her father's adoption. He had a preconceived idea of what a Kansas City girl was likely to be. But who was he, John Bodewin, a native of one of the little Sound cities of Connecticut, that he should be setting up geographical standards and prejudging his countrywomen by them? And what was there about Newbold to make it incredible that he should be the father of a girl, too handsome not to be supposed to know it herself, who kept her quiet pose under the eyes of a stranger with an unconcern that had in it as little of bravado as of stolidity?

"So that is Mr. John Bodewin!" Miss Newbold said, with meditative emphasis.

"It's queer you should never have seen Bodewin," her father remarked.

"I think I did see him once, without knowing it was he, coming out of the Wiltsie House with Mr. Craig."

"Where were you?"

"I was looking out of our window, papa, hoping every next man on the street would be you. It was nearly eight o'clock, and I was simply perishing for my dinner."

"I suppose I must have come along after a

while, as you didn't perish," said Mr. Newbold. "When was it you were so near dissolution?"

"It was on Saturday, the nineteenth of June. I remember the date, because that morning you first told me about the lawsuit, and the text on my calendar was 'Keep o' the windy side of the law'—'especially mining law,' I wrote underneath, and pinned it in the frame of your looking-glass. But you did not see it, because that afternoon our rooms were changed."

"You and Bodewin must consult the same oracle," said Mr. Newbold. "It was on that afternoon in Craig's office he positively refused to go on the case."

"Did he give you his reasons for declining, papa, or don't they give reasons?"

"They do as they choose, generally. Bodewin chose to keep his to himself."

"I suppose he thinks we are quite in the wrong, and is too polite to say so."

"What he thinks is not precisely what we are after." Mr. Newbold moved restlessly and felt in his pockets for a handkerchief with which he removed the marks of charred pine-wood from his fingers. "He is supposed to have in his possession the facts we need to complete our case. If he would consent to part with them on the witness-stand, he might keep his opinion and welcome."

"Are these facts Mr. Bodewin's property exclusively, papa?"

"So far as I know, they are."

"Why, how wretched of him! He might as well be a Uinta man and done with it! Is he, do you suppose?"

"I don't profess to know, my dear, what he is!"

"Would any other person who happened to have the facts Mr. Bodewin has be as desirable a witness as he?"

"More so, perhaps. I have told you it is not Bodewin we want, but his facts. He is an expert, but in this case he is not asked to give an expert's testimony."

"What does it imply, do you think?"

"What does what imply?" Mr. Newbold took his cross-examination with a half-bored, half-amused smile. He had a sharp eye in a mild, blunt-featured, smooth-shaven face.

"His refusing to testify, papa," his daughter patiently explained.

"It might imply, among other things, that Mr. Bodewin is not in want of money at present."

"Are witnesses paid much money for their testimony?"

"Depends on the witness, and the nature of the testimony, and on what you call much."

"Papa, you will have to hold me! You look so comfortable, and there is nowhere else

to sit." Miss Newbold pushed aside her father's cane and seated herself, with a smile half deprecating, half playful, on his knee.

"If I look comfortable my looks belie me," he sighed, adjusting himself to the weight of her slender figure. "Why *do* we sit? Why don't we move on?"

"Where shall we move to, if you please? Back to the Eagle Bird, and sit on the piazza with the sun in our eyes? *Look* at that valley!"

"Looks hot, don't it?"

"Papa? How — much — did you offer Mr. Bodewin?"

"How much what?" Mr. Newbold doggedly held out.

"Poor papa!" said his daughter, holding him by the shoulders and laughing, with her face close to his. "It's no use pretending you are not going to tell me. You know you are; — it's only a question of time."

"Come, get up, Josephine! You're too heavy; this log needs a saddle on it."

"I never was too heavy before."

"You never before found me reduced to such a painful extremity for a seat."

"How much, papa, and I'll let you up."

"Let me up first and then we'll see about it. What do you want to know for?"

"I want to know partly because you don't want to tell me. Come, papa! On compulsion, you know. A man may say anything under pressure. There's nothing yielding about you. Besides, it's only mines. It hasn't anything to do with your real business!"

Mr. Newbold relieved himself by a resolute push from the burden of his daughter's loveliness, and got himself stiffly upon his feet.

"By George, you *are* heavy!" he muttered reproachfully, as he limped a few steps along the trail.

"Now, papa, be a good boy. Be frank with me for once," Josephine pleaded, still laughing and dragging upon his arm with her hands locked within it. "You need never hope to look upon the Eagle Bird again unless you tell me how — much — money — you offered Mr. Bodewin."

"Well, to be frank with you," said Mr. Newbold, attempting to light a cigar under difficulties, "I never offered Mr. Bodewin a penny. But my lawyers offered him — five thousand dollars, and be hanged to him," he concluded, as he tossed his extinguished match into the dust. Josephine released his arm suddenly and confronted him in sober amazement.

"Papa, I wish I had some facts I could dispose of at that rate. Isn't that a good deal of money to offer a man for just telling the truth?"

"Would you expect a professional man to

spend his time in court on another man's case for the witness-fees?" Mr. Newbold asked.

"How much of his time would he have to spend?"

"An hour, perhaps, actually on the stand." Mr. Newbold yielded the point carelessly.

"I should not have supposed, from Mr. Bodewin's appearance as he rode through the woods just now, that his time was worth five thousand dollars an hour."

"There are hours and hours of a man's time, my dear. This may not be one of Bodewin's five-thousand-dollar hours."

"Papa, you know perfectly well there is no man living who can earn five thousand dollars honestly in an hour."

"Do I?" said Mr. Newbold, unconcernedly; "I wish I knew by personal experience to the contrary."

"Well, I am glad he did not take it. I respect him for not taking it. At the same time —"

"You would like to know whether he was offered more by the other side to keep quiet."

They were walking now along the trail, Josephine preceding her father. As he spoke and laughed his easy, unmirthful laugh, she looked back at him. The level sunbeams striking across her eyes turned the blackness of their thick, curved lashes to a reddish brown.

"Papa, do you believe that?"

"I'm not a man of many beliefs," Mr. Newbold replied, with the manner of one who is done with a subject.

Josephine wished her father would speak again, and rob those last words of their unpleasant significance, but he followed her in silence, striking off, with his aimlessly industrious cane, the brittle, charred twigs that came in his way. When they were nearly opposite the tunnel, the trail widened, and she walked at his side.

"Papa," she said, turning to him brightly, as if to make open amends for her tacit dissatisfaction with him, "why won't you take that Bird off the name of your mine. — Eagle Bird!" she repeated, mockingly.

"We'll wait and see who the mine belongs to. Mr. Harkins's taste in names may not be the same as yours."

"Well!" said Josephine, "the name is definite enough, if the ownership is vague."

II.

A COMMUNITY OF SPECIALISTS.

AN acre of the hill-side above the tunnel had been cleared of its scorched timber to

make room for the surface "plant" of the Eagle Bird. The ground was hard and verdureless. Each day's dust, before the next day came, was swept into windrows or whirled away altogether by intermittent gusts, charging up the slope from the valley. The "plant" consisted of the main shaft-house and a number of log-cabins, sheds, and board-houses, grouped irregularly round it. The dwelling of the superintendent was distinguished by its high porch, with an ornamental cornice supporting the eaves, and by the addition of shutters to its windows. Some feeble vines had been early balked in an attempt to climb the loose warp of strings extending from the railing of the porch to a series of nails ruthlessly driven into the cornice above. Two or three saddle-horses, hitched to the posts which supported the gallery, were swinging their heads discontentedly, and a row of men stood with their backs against the side of the house near the lower entrance, each man with his chin elevated and his hat tilted forward over his eyes, as a defense from the rays of the low sun. Sammis, the temporary superintendent of the Eagle Bird, was holding forth on the subject of the lawsuit to a few friends who had ridden over from the new camp at Spearfish.

As they passed this group Josephine confided to her father in a little grimace her opinion of the gentlemen from Spearfish. She ran up the steps of the piazza, while her father remained below, joining in the talk of the men.

"Say, Mr. Newbold," Sammis appealed to his principal, "I been telling the boys that you bought this here Eagle Bird mine of Jim Keesner, and nobody but him. Is that so, or ain't it?"

"That is so, Sammis," said Mr. Newbold. "The mine was located in Keesner's name, and the transfer of titles was made between him and myself exclusively. Harkins's name wasn't even mentioned. I'm not a mining man, gentlemen," Mr. Newbold continued, smiling upon the company at large, "but I've heard of Colonel Billy Harkins. He's pretty well known in Kansas City."

"He's sold some mines there, may be," one of the delegation from Spearfish remarked.

"More than he will ever sell there again," said Mr. Newbold. "I never would have touched the property without an expert's report on it, if the colonel's name had been in any way connected with it. I didn't know even that he owned the Uinta."

"The boys here," said Sammis, "was remarkin' it seemed kind o' keerless in you to buy a mine on paper, as you might say. I told 'em you had a copy of the first location notice certified to by the recorder of this district."

"That ought to fix the *title* all right," one of the Spearfish men admitted; while another offered the amendment, "If mining records was ever kep' as they'd ought to be, and not sloshed round so public like."

"That's just where I drop on it," said Sammis. "That recorder must 'a' certified to a false copy, or else the record's been tampered with. There isn't a man in camp that don't believe Mr. Newbold owns this mine. Question is, how you goin' to prove it? Why — Lord, when I first got notice to quit work in the new shaft, I didn't pay no more 'tention to it! I just walked into the court-house one day, and asked to have a look at the location notice of the Eagle Bird mine. And, by —, there they'd got it all fixed."

"I'd hunt that recorder with a shot-gun!" one of Sammis's friends remarked.

"I wouldn't waste time on him — I'd hunt Jim Keesner," another one said.

"Yes, there'd be more huntin' than findin', I guess," said Sammis. "There's plenty of room between the Rockies and the Sierras for Jim Keesner to hide out; he might be guidin' parties in the mountains; he might be ranchin' it or teamin' it; he might be prospectin' round among the hills somewheres, or down on the reservation; he might 'a' joined them fool Mormons."

"What's Hark' say 's gone of him?" one of the group inquired.

"Harkins! Harkins is as innocent as the babe unborn. He don't know nothin' 'bout Keesner. He just p'int's to his records."

"When I first arrived in the camp," Mr. Newbold interposed, "I should say as many as twenty men came to me and offered to take their affidavit that the Eagle Bird monuments had been moved, and that the change had been made since our big strike here. But come to cross-examine them a little, they got all mixed up in their memories. Some remembered one thing and some one else contradicted it. You couldn't get a single witness who would be worth anything to us out of the whole lot of them."

"Course not," said Sammis. "I know them monuments has been moved, but I couldn't prove it to a jury. You don't want memories; you want facts. The facts in this case is — *you* know, Jim," Sammis appealed with a gesture of his thumb to the man who stood next him, "when they first org'nized the district, Shirley Ensign, he called himself, was recorder. P'lonius was the name he went by. Kep' his records in an old candle-box in a corner of The Gem. Then, *you* know, just after they made their big strike up here, The Gem took fire. Of course it was accidental! Harkins packed the records across the street

into The Oasis; but it took him a day and a half to get there ——”

“What business had he with the records?”

Mr. Newbold interrupted.

“Much as anybody,” Sammis briefly explained, absorbed in his statement of the situation.

“Where was the recorder?”

“Most likely he was drunk — but, as I was sayin’, during the time Colonel Billy had them records, he prob’ly looked them over to his advantage. Now, you see,” — Sammis sat down on the heels of his boots and drew in the dust with a bit of charred stick two parallelograms side by side, with their boundary-line in common, — “them two claims lay this way. Harkins’s workin’s was here, and the Eagle Bird had just made a strike right there”

— he made two small circles with the bit of stick in the opposite corners of each parallelogram. “The colonel knew them two holes were on the same vein. He just takes them records and floats the north end of his claim right bod’ly to the west’ard, and brings his side line down catercornerin’ — that way; and some day when there ain’t anybody round, he changes his stakes, and there he’s got a first-class legal location right plumb onto your ground.” Sammis turned the force of his peroration upon Mr. Newbold. “Oh, the colonel’s always legal! He’s got his affidavit men always handy. And there’s another little peculiarity of his’n you want to keep in mind — he’s uncommon lucky in his juries. Now, the man that surveyed them two claims for the location was John Bod’n, and prob’ly he’s got the notes — and also prob’ly the colonel’s got him coppered.”

“Sammis, you are a little too figurative for mesometimes,” Mr. Newbold mildly observed. “What do you mean by coppered?”

“Bet’n he won’t turn up,” several voices

replied, and every man of the group turned a pitying eye on Mr. Newbold.

Sammis drew the sole of his boot across his diagram, spat upon the smoothed dust, and so rested the case according to the Eagle Bird. The gentlemen from Spearfish, remarking that they had “better be a-movin’ on so as to git into camp before dark,” mounted their horses and took the lower trail toward the valley.

Mr. Newbold was familiar with the Sammisian theory of the case between the mines, but each fresh exposition of it made him more restive, especially on the point of Bodewin’s obduracy.

“Sammis, did you mean to convey by that figure of speech you used just now ——”

“That which, sir?”

“That expression you made use of in reference to Bodewin — that Harkins has bought him?”

“Well, sir, I should take Bode’n to be rayther of an expensive article to buy for a man of moderate means; but you can just bet your bottom dollar the colonel’s got some holt on him, or he never’d ’a’ started the scheme.”

“I can force him with a subpoena, if there is no other way to fetch him.”

“Well, now, Mr. Newbold, I don’t want to give advice, but you don’t want to send a sheriff huntin’ Bode’n, if you mean to git him! He knows this country. He can find his hole and git into it *too* quick.” As Sammis became excited, his tone grew more nasal and his speech more untrammelled. “You can’t drive him and you can’t buy him, in my opinion, — but if you can find Harkins’s holt on him — well, I do’ know! If you *did* ketch him and force him onto the stand, an unwillin’ witness is worse than none.”

Mr. Newbold and his daughter rode back to the camp in the splendor of a sunset that loomed red behind the skeleton pines. Josephine let her horse take his own way down the wagon-track, while she watched its dying changes. But she lost the last tints in her preoccupation with the dust and the strange meetings and passings on the broad and level road by which they approached the town. That quickening of the pulse which makes itself felt in every human community as day draws to a close had intensified the life of the camp. The sound of its voices and footsteps, the smoke of its fires, rose in the still, cool air. Cradled between two ranges of the mother mountains of the continent, the little colony could hardly have been more inland in its situation; it had nevertheless in many respects the character of a primitive seaport. It owed its existence to hazardous ventures from a distance. Its shops were filled, not with the fruits of its soil or the labor of its hands, but

with cargoes that had been rocked in the four-wheeled merchantmen of the plains. Bronzed-faced, hairy-throated men occupied more than their share of its sidewalks, spending carelessly in a few days and nights the price of months of hardship and isolation. Its hopes and its capital were largely bound up in the fate of adventurers into that unpeopled land which has no history except the records written in fire, in ice, and in water, on its rocks and riverbeds; the voyagers across that inland sea where the smoke of lonely camp fires goes up from wagon roads that were once hunters' trails, and trails that were once the tracks of buffalo. There were men seen at intervals of many months in its streets, whom the desert and the mountains called, as the sea calls the men of the coast towns. It was a port of the wilderness.

The arrivals due that Saturday night were seeking their dusty moorings. Heavily loaded freighters were lurching in, every mule straining in his collar, every trace taut and quivering. Express-wagons of lighter tonnage took the dust of the freighters, until the width of the road gave their square-trotting draught-horses a chance to swing out and pass. In and out among the craft of heavier burden shuffled the small, tough bronchos. Their riders were for the most part light built, like their horses, with a bearing at once alert and impassive. They were young men, notwithstanding a prevailing look of care and stolid endurance, due in some cases, possibly, to the dust-laden hollows under the sun-wearied eyes, and to that haggardness of aspect which goes with a beard of a week's growth, a flannel shirt loosely buttoned about a sun-burned throat, and a temporary estrangement from soap and water. These were the doughty privateersmen, returning with a convoy of pack-animals from the valley of the Gunnison or the Clearwater, or the tragic hunting-grounds of the Indian Reservation.

Taking the footpath way, beside his loaded donkey trudged the humble "grub-stake," or the haggard-eyed charcoal-burner from his smoking camp in the nearest timber, while far up on the mountain, distinct in the reflected glow of sunset, a puff of white dust appeared from moment to moment, following the curves of the road, where the passenger coach was making its best speed, with brakes hard down, on the home-grade from the summit of the pass.

Mr. Newbold and his daughter entered the town by a side street, and wheeled their horses, at a sharp trot, into the main avenue, a few blocks above the Wiltie House. The avenue was straight and wide, as befits the avenue of the hopeful future; but the houses were the

houses of the uncertain present. They were seldom more than two stories in height, miscellaneous in character, homogeneous in ugliness, crude in newness of paint or rawness of boards without paint. There were frequent breaks in the perspective of their roofs, where a vacant lot awaited its tenant or the tenant awaited his house. There were tents doing duty for houses; there were skeleton structures hastily clothing themselves with bricks and mortar that meantime impeded the sidewalk. One-half of the street was torn up for the laying of gas-pipes, and crossings were occasionally blockaded by the bulk of a house on rollers, which night had overtaken in its snail-like progress. The passing crowd was a crowd distinguished by a predominance of boots and hats—dusty or muddy boots, and hats with a look of preternatural age or of startling newness. There was a dearth of skirts; and these, when they appeared, were given a respectful, an almost humorously respectful, share of the sidewalk. The crowd went its way with none of that smart unanimity of movement which characterizes the up-town and down-town march of feet trained to the pavement. It slouched and straggled and stared, and stopped in the middle of the common way, and greeted its friends, and vociferated its sentiments, and exhibited its ore-specimens of fabulous promise, regardless of incommoded passers. It was invariably good-natured.

Two distinct groups were forming in the street: one, small and shifting, in front of the Wiltie House, expecting the hourly arrival of the stage; and one larger, more persevering and disorderly, on the corner opposite the Variety Theater, where a band of music was playing airs of a rather belated popularity. Spanning the street, between the upper windows of the theater and the opposite roof, a tight rope was stretched against the fading flush of sunset, and a Mademoiselle Cordova (whose colors were also fading, but were capable of resuscitation for the evening's performance) was advertised to make her *début* in the camp upon this rope. Here the expectant evening stir reached a climax of excitement, and beyond it suddenly ceased. In fact, the town ceased. There was nothing more but the stage on which its shabby little drama was set. Its lights were lowered; the wind of evening, of coolness and vast space, drew through its lofty wings. Ranging down the valley, peak beyond peak, the mountains lifted their illumined heads.

"The sunset is gone!" Josephine exclaimed; "but what a night,—oh, what a night! Papa, do look at the mountains," she shouted, trying to catch his ear in the noise of the street.

"Never mind the mountains,—look out for that freighter!" her father replied. "You can't ride here as if you were on Wabash Avenue."

A little later she tried again, "Papa, where do you suppose they all come from?"

They had halted at the edge of the sidewalk, and Josephine was gazing around her at the moving mass of male humanity, while her father dismounted with circumspection.

"Oh, they are the superfluous people from everywhere."

"Why, of course! Just like us. I never felt more superfluous in my life!"

Laughing as she leaned from her saddle, with her hands on her father's shoulders, she dropped lightly to the ground, and the door inscribed "Ladies Entrance Wiltie House" closed behind her.

The Newbolds usually dined late, on a theory that by so doing they escaped the greatest crowd, in the only dining-room of the hotel. Josephine had changed her dress and was moving about in the solitude of the ladies' parlor, looking at the desolate chromos on its walls, and sitting in unquiet attitudes on its blue velvet chairs, when her father entered. He was looking fatigued, and with the tired expression the lines of his face lapsed into a heaviness which emphasized the contrast between father and daughter as they stood opposite each other. Mr. Newbold's proportions were conspicuously inelegant, while Josephine stood lightly on her feet, her small dark head nearly as high as her father's. Her low-browed, round-cheeked face, with its long sweep of eye-brow, short, full mouth and rich coloring, would have been excessively pretty, wanting its candid brightness of expression and the dark eyes which gave it dignity. With these, it was quite enough to have convinced Bodewin of the fatuity of local prejudices where girls are concerned.

Mr. Newbold had entered the room pre-occupied with an idea which had struck him as a good one from several points of view.

"Josephine," he began, in pursuance of this idea, "wouldn't it rather amuse you to *meet* Bodewin?"

Josephine stared at him.

"He is one of the types of the place, you know," he continued resolutely. "Not the red flannel shirt and revolver style, but something a little more subtle, as you would say. A kind of a Yankee lotus-eater."

Josephine was struck by a somewhat awkward deliberation in her father's manners. The word Yankee coming from him also displeased her in a way she felt to be childish. Her mother and her mother's people had been Yankees, so called. As she remained silent, her father added at random:

"You are a student of human nature, you know."

"I, papa?" Josephine laughed uncomfortably. "What put that into your head? All the human nature I ever tried to study was my own, which is certainly human. I am not looking for types; I shouldn't know one if I saw it. If you mean, would I like you to introduce Mr. Bodewin to me, no, papa, thank you, decidedly I would not. I hate to make acquaintances in that premeditated way."

"Well, well! It's hardly likely you would *know* Bodewin—I only thought he might help you to pass the time while we are here, and the chance of talking with a nice, bright girl in a place like this would be a boon to any fellow."

"He has not shown himself very eager for the chance," said Josephine. "Besides, papa, if he is going to be so disagreeable about your lawsuit, I don't know why we should be civil to him."

Mr. Newbold reflected that a little timely civility might go far to overcome Bodewin's disagreeableness, but he wisely kept this reflection to himself. Josephine was unsophisticated, as all men, however wise in their generation, like their women to be.

III.

MRS. CRAIG'S LITTLE DINNER.

"WHEN will you come up?" Mr. Craig asked of Mr. Newbold the next afternoon, as his client was leaving the office of Joseph Craig, counsel for the Eagle Bird against Lee and Harkins. "We want you to come before the Government Survey moves into its new quarters. The party are in camp now in the woods back of our cabin. There is no better company this side of the range than you'll get round their camp-fire of an evening. No ceremony—pot of beans or oatmeal or what not, boiling on the coals for to-morrow's breakfast—boys in their buckskins—not one of them but your daughter might dance with, or dine with, or gallop across country with, as she happened to find them. They're liable to turn up almost anywhere, those fellows—at the swell clubs in New York or London, or the President's receptions, or digging their way up some mountain-peak above snow-line."

"I hope I shall never meet any of them there!" Mr. Newbold interjected.

"No," laughed Mr. Craig, "it isn't likely you will—I never met any of them there myself. Well, when will you come? Thursday? Thursday then. We are only camping

within four walls ourselves. We can't ask you to *dine*."

"We can hardly be said to dine at the Wiltsie House."

"No, it's a good time to take you, after a fortnight at the Wiltsie. You must have forgotten how the flesh-pots tasted. Tell Miss Newbold to put on a pair of stout boots, and after dinner we will go over to the Camp of the Geologists and get Hillbury talking, if we can."

"My daughter will be delighted. She gets restless these moonlight nights, because she cannot be out-of-doors. It is too bad to be shut up in a third-rate hotel with such a country as this around us. I don't know where to take her. I'm half tempted sometimes to give some of the young fellows round here a chance to amuse her. I'm not much of a rider or much of a climber, myself. She wants to get up on top of some of those peaks, and she wants to go down in a mine."

"Of course she does; and you can't find any better fellows to trust her with than Hillbury's crowd. If she wants a chaperon, my wife will go along with her any time you like to get up a party."

"It's very kind of you, Craig, I'm sure." Mr. Newbold had buttoned his coat and taken up his hat and cane. He stood, tapping the one against the other, while Mr. Craig spoke to a clerk who had stepped to the door of the private office. "How about Bodewin?" he said, as the door closed and Mr. Craig turned back to his desk.

"Bodewin? There's nothing new about Bodewin that I know of."

"Have we got to give him up?"

"Not at all. We can't give him up. There's the subpoena, when we're ready for it."

"I don't like that. I don't think we'll gain anything by it. Now, Sammis has an idea in his head once in a while. He says it's no use to try the subpoena on Bodewin. He'd manage to leak out; or, as he puts it, an unwilling witness is worse than none."

"This is not a question of verbal testimony," Mr. Craig rejoined. "Bodewin can be required to produce certain papers which he is pretty well understood to have had in his possession when Harkins first made his claim, and it was known you would resist it. Now, if he has the papers, that is all we want. If he has destroyed them since the dispute about the records came up, he must have had some reason for doing so. He can be required to give it. Don't you see? His unwillingness is a strong point in our favor — the more obvious the unwillingness, the stronger the point. He does not intend to appear against Harkins, that I'm tolerably sure of. Money won't fetch him. There is some personal hitch."

"I'd like to know what it is."

"So would I. But I don't think we ever will know — from Bodewin."

"Has Bodewin any 'pard,' as you say out here, or any intimate friend in the camp?"

"I don't think he has any intimate friends here, except Hillbury of the Survey. He was on the Survey himself, under Wheeler. As for a 'pard,' Bodewin is a gentleman, as you say back there."

"What I am getting at," said Mr. Newbold, "is whether Bodewin is among his friends here, where he would be likely to talk about his affairs now and then when he felt communicative, or whether he is shut up in himself. According to my small experience of men, I believe that almost every man, even the most reticent, once in a while, perhaps, will talk to some one. The shyer he is and the longer he has been locked up, the more likely he is to open out to the right one, if the right one happens to come along at the right time. Now, with Bodewin, if we could get at his scruple, whatever it is, it would be a great point gained. I don't like this subpoena. I don't like it at all — with a man like him. You don't know what turn he might take. It's too much like a Jack-in-the-box — you open the box, and the thing is out in spite of you. The right way is to get at his reasons, whatever they are, and meet them — talk him out of them. But you can't argue with a man when you don't know your premises."

"Mr. Newbold, I don't know what influence you may have with Bodewin, but I can't flatter myself, from what I know of him, that I'm the right one to induce him to unburden himself."

"Nor I either, my dear sir. Now, between us both, I shouldn't wonder if it were a case for a woman."

"D—— a woman!" Mr. Craig now turned from his desk and gave his fullest attention to his client's rambling remarks. "What woman do you propose to introduce into the case?"

"Well," said Mr. Newbold, disconcertedly, "I haven't any in view at this moment. But I suppose Bodewin is not the kind of man to be influenced by a woman who wasn't a — well — a lady."

"Oh! If it is a case for a lady's influence, you will hardly need any legal adviser."

Mr. Craig turned back to his desk and began to pull about his papers.

"My dear Craig, — hold on! You're taking me too seriously altogether, I assure you. It is of no consequence — only a suggestion. I hate to leave the camp with the thing in the shape it's in now."

"Leave the thing to me, Mr. Newbold, —

and leave the woman out of it, if you please. I think, myself, you'd much better stay and see it through. You'll be better satisfied, you know."

"I dare say you are right."

"I wish you *would* stay until after the trial. You'll see some fun. Mining law is peculiar," Mr. Craig called after his client. He had not taken the trouble to see him to the door.

Mr. Newbold had been advised, in his choice of counsel, to employ a man of local knowledge and reputation rather than one more widely known in the profession. Each State, each mining district even, had its own mining laws, and few busy lawyers, however well read, could keep informed of all these various "local regulations and customs."

Mr. Craig was a small man, too nervous and irritable for a lawyer, with a large head, a complexion of reddish fairness, and a peremptory, careless manner, cultivated in provincial Western circles. He had been educated at an Indiana college, and going East soon afterwards, on the usual pilgrimage which the complacent young West makes at least once in its life, to the old, sad, unprosperous homes of its conservative Eastern relatives,—critical, even in their decline,—had fallen in love with a second or third cousin, a surprisingly lively young person for the only girl left in a large, elderly, and peculiar family connection.

It still remained a wholesome mystery to him how he had managed to persuade this young woman to go West with him. She had seemed to him the cleverest girl he had ever met, and the most insensible to masculine attractions. She had laughed at his little egotisms and provincialisms, and at a later stage of their acquaintance had fiercely maintained the superiority of the most commonplace Eastern existence over the most triumphant career life could offer west of the Little Miami. And yet she had married him. Her friends considered that she had thrown herself away, both as to the man and his circumstances; for even in the most figurative sense Joseph Craig could hardly be regarded as a type of that vast material prosperity of the West his Eastern relatives found, in theory, so revolting. Mrs. Craig had expected that she would make a great change in her husband, if not in her husband's circumstances. She would make him wear darker clothes and smaller hats, and reform him of a habit of leaning on the hind legs of his chair, and of passing his hand over his hair in the pauses of conversation. She would make him see the logic of free trade, and persuade him to read Emerson and Herbert Spencer instead of so many newspapers. She would insist

upon less prominence in his final r's. They had now been married nine years, but no change as yet was evident in Craig, except that he was growing stout and slightly bald. Mrs. Craig's complexion had lost its delicate New England bloom in the strong Western suns and winds; she had grown thin instead of stout, and her soft frail light locks were scarcely abundant enough to make the small low knot which was fashion's modest demand at that time. But she met all changes for the worse in her appearance with rather a defiant honesty, secure in the conviction that "Joe" liked her just as she was. She was as lively and inconsistent as ever, as vociferously opposed to her husband in theory, and as vehemently his partisan in practice. She was restless, merry, moody, wearing herself out over her work or her play; overestimating or underestimating her friends and her own circumstances; enthusiastic over her children's promise or in despair over their performance. Mr. Craig had that immense respect for his profession that an unknown Western lawyer with a decidedly illegal turn of mind might be expected to have. This was one of his idiosyncrasies which his wife had never laughed at him about. Clever and keen as she was, she had never yet seen her husband quite as others saw him, and happily took as serious a view of him professionally as he did of himself.

Mr. Craig was absolutely, almost vindictively, honest. He had many, in fact most, of the paramount virtues, but he was one of those men who are elected to be poor, to be unpopular, and to be held at less than their actual worth. The Craig household, like many another on the frontier, was conducted on the theory of "catastrophism" rather than that of "uniform law." The dinner to the Newbolds happened to occur on one of its days of "convulsive upheaval." Mrs. Craig's butcher had betrayed her, her greengrocer had "gone back on her," her cook had stabbed her to the heart's core of her housewifely pride. Finally, her eldest boy, a three-year-old, had tumbled into the hydraulic ditch which flowed past the house,—at a temperature of melted snow,—had been dragged, dripping and gasping, into the house, about twenty minutes before the dinner-hour, stripped of his clothes, hastily scolded, and rubbed down with brandy and rough towels in front of a scorching fire in the dining, reception, and only living room of the house, and tucked into his bed as the guests arrived at the door. The maid of all work opened the door, while Mrs. Craig swept up the towels in one arm, and retreated to her bedroom, holding the boy's wet garments at arm's length. With scarlet

cheeks, a rather dubious smile of welcome, and with an irrepressible odor of brandy pervading her garments, she appeared before her guests a moment later, shutting out a burst of infant wrath and dolor, as she closed the door behind her. The soft-hearted Irish servant, who was putting the last touches to the table, was so distracted by these sounds that she could hardly be induced to remember she had other duties besides those of consolation. The nurse had been sent to the camp to inquire into the non-appearance of the fruit which had been ordered for dessert.

It was an inauspicious beginning to an extremely bad little dinner. Fitful bursts of gayety from the hostess alternated with sudden silences, during which her eyes wandered anxiously towards her husband's face. Coffee was served at last, and the company turned its chairs from the table to the fire. Mr. Craig went in search of a box of cigars, and the evening cleared up with a promise of cheerfulness if not of brilliancy.

There was still the visit to Mr. Hillbury's camp to redeem the failure of the dinner. Mrs. Craig perhaps overvalued the picturesque in the absence of the comfortable, but she had been moderately comfortable all her life and had only since her marriage begun to be even remotely picturesque.

IV.

THE CAMP-FIRE.

THE Craig cabin stood on a narrow peninsula of roughly cleared ground, with the pine woods behind it. It was characteristic of mining nomenclature that the stream of pure swift-running water, which formed this peninsula, taken from the infant Arkansas, should be called a "ditch." The path which ran beside it was called, in the same concise nomenclature, the "ditch walk." It was a favorite promenade of the camp. It commanded a view of the sunset behind the pine woods, of the camp in the gulch, and of the mountains which rose beyond, taking upon their worn, sphinx-like faces the sun's descending glow. Mrs. Craig had walked off more than one imperative fit of weeping there—nervous weeping, without assignable cause, unless it might be a dumb awe and terror of her surroundings, as if several layers of the earth's crust had been torn away, and she, with a modern woman's oversensitiveness and complicated needs, had been dropped upon one of the primeval strata, with huge dumb forms of unknown life around her. The mountains themselves had, to her morbid fancy, an oppressive individuality. They intruded upon

her, in the midst of her small, subtle joys and pains of to-day, with their heart-breaking stolidity and their immense past. They took the meaning out of her efforts, and made them seem of no avail. When she tried to express these fancies to her husband, he received them into his masculine consciousness as a phase of her own idiosyncrasy, in spite of her assurance that every other woman in the camp probably had the same. That evening, as she kept the path beside Josephine in the moonlight, she had no fancies that were not cheerful. Perhaps it came of the contact with a younger, stronger, and simpler woman's nature. Perhaps she was healthfully tired from her domestic difficulties and enjoying that slumber of the nerves which comes with honest bodily fatigue. The mountains looked to her only solemn and beautiful, and were simply a noble range of peaks guarding a valley filled with moonlit haze. The moon, peering behind the pine trunks, had no expression beyond that of the full moon, half an hour risen. Under her sense of the beauty around her, was the happy thought of a wife who sees a remarkable proof of her husband's goodness in his least and most natural act. There was not another man in the world, she felt sure, who would not have been furious over such a grotesque failure as her dinner had been. She hurried Josephine gayly along, and now they stopped on the edge of the wood to wait for the men, who had followed more slowly. A sound of wind came from the gulch, distant at first, creeping from tree to tree, making a sudden hurry and shivering rush in the trees above their heads, and stealing away again down the dim slope towards the valley.

"Yes, that is the camp," she said, in reply to a question from Josephine. "Take care of those pine stubs—you cannot see them with the light in your eyes; won't you take hold of my hand?"

"Won't you take hold of mine?" laughed Josephine. "I am ever so much taller than you."

"Yes, but I know the ground. I walk here hours and hours by myself. There is no one in camp all day except the cook, who is generally asleep in one of the wagons; but the tents and the mules stamping and munching make it seem less lonely in the woods. That is Mr. Hillbury—the dark head against the tent-curtain; he is the chief of this party, you know. You must notice his buckskins. They are Indian-tanned, made by a London tailor. We have to amuse ourselves with these little contrasts—they are the spice of life out here."

Mr. Hillbury, hearing the footsteps and voices approaching, came out to meet his

guests, saying, "Who are these in bright array?" He looked extremely well in his suit of buckskin, which was of a light-gray color, toned by use, and set off his dark complexion as if chosen for that purpose alone. There was the usual indistinct mention of names as the group of young men around the fire rose to their feet. The camp lamented its deficiencies in the matter of seats. "There was but one camp-stool, which, both ladies declining, was bestowed by acclamation on Mr. Newbold. "I'm the oldest and heaviest," he declared, and accepted it on that basis. The other seats were sections of pine logs with boards nailed across the top. Mrs. Craig, seeing Josephine balancing herself on one of these inverted pedestals, called to her to come and share with her a camp-blanket spread on the ground. A man reclining on one elbow near them, with his feet to the fire and his face in deep shadow, gathered himself into a sitting posture and gave them good-evening.

"Good-evening, Mr. Bodewin; were you here when we came?" asked Mrs. Craig, leaning forward and speaking across Josephine's lap.

"Yes, Mrs. Craig. I got up and made my bow with the rest, but the fire was between us."

"I did not see you," said Mrs. Craig — "Miss Newbold, this is Mr. Bodewin."

Bodewin moved nearer, first knocking the hot ashes out of a brier-wood pipe and thrusting it, bowl downward, into a breast-pocket of his coat. "Poor Mr. Bodewin!" said Mrs. Craig, noting the action sympathetically. "As the wife of a smoker I can feel for you. You had found such a nice place to finish your pipe in silence and in peace; now we have interrupted your pipe and broken your silence."

"There is always something to be thankful for, Mrs. Craig," Bodewin replied. "You might have interrupted the silence and broken the pipe."

"I knew you would say that," laughed Mrs. Craig.

Josephine was listening less to Bodewin's words than to his voice, low-pitched and rather languid, with an accent that was negligently pure. His face she could not see without turning, too evidently, to look at him.

Perceiving that she had a neighbor on her right, Mrs. Craig began talking to him, and the group thus divided itself.

"How you must enjoy this life!" said Josephine, filling the pause with the first words she could think of.

Before answering, Bodewin deliberately shifted his position so that it commanded a view of her face, one-half of its beauty revealed in the firelight, the other suggested in shadow.

"Do you mean the life of the Survey?" he asked.

"Yes," she said.

"It is a good life, no doubt, but it is not mine."

"I thought you were of this party."

Bodewin fancied that he had lost a degree of her interest by this admission. He could see her bright eyes exploring the circle of dimly seen faces around the camp-fire, and doubted not she was already idealizing their owners in true girl-fashion, and imparting to the life they led all the picturesqueness she found in its accidental surroundings.

"No," he repeated, with his lazy intonation, "I am not a mining geologist, nor a physical geologist, nor a geological physicist, nor even a supernumerary on board wages."

"That is what I should like to be — that last."

"Why, if you please?"

"It must be so easy to earn board wages, — especially —"

"When the board is rather bad?"

"They are *not* wildly luxurious, are they?" she whispered.

"No; the pursuit of science under government is not a luxurious calling. However, it is but fair to the government to say that this is a temporary arrangement. The Survey goes under cover next week, and I dare say they will have a few chairs."

"Mr. Bodewin, haven't *you* some capital letters after your name?"

"After my name, Miss Newbold? When had my name the honor to be seen by you?"

"I think it was — about two weeks ago — in a letter to you from my father," she hesitated, conscious of a somewhat awkward reason for the question she had asked — "and the letters were M. E."

"I believe I am entitled to C. E. after my name, but the M. E. must have been a friendly flight of imagination on your father's part."

"Are you not a mining expert?"

"I have been so called. But I believe there is no such title in the back of the dictionary."

"Who is talking about dictionaries by the light of a camp-fire?" Mrs. Craig exclaimed, adding her profuse treble to the duet. "Are you beginning at the fountain-head of conversation in the English language? If Miss Newbold were a Boston girl, I should be sure she had a dictionary — a German dictionary — in her trunk, even if it crowded out her best bonnet."

"I'm sure there's no best bonnet in my trunk," said Josephine. "Perhaps I ought to be ashamed to say I brought but two books with me, and those I can read without the aid of a dictionary — even an English one."

Mrs. Craig thought the contents of a traveler's trunk were next to a biography of its owner. "It represents his necessities, the things he cannot leave behind. If we knew those two books Miss Newbold chooses out of all those she leaves at home, we should know Miss Newbold."

"Suppose she makes a good choice but doesn't read the books after she has brought them," Josephine said.

"Then we should know her aspirations. They are as much a part of us as our necessities, surely."

"The part a biographer usually leaves out," Bodewin said. "How about the traveler who has'n't necessities enough to fill a trunk? How would you write his biography, Mrs. Craig?"

"Oh, a man who has no trunk cannot expect to have a biography. Practically, he doesn't exist."

Following the silence Mrs. Craig's peremptory little speech had made, Josephine asked:

"Will you tell me, Mr. Bodewin, what a mining expert is, granting that M. E. doesn't stand for him, and that he isn't in the back of the dictionary?"

"He is, usually, a gentleman who asks a good deal of money to tell you how little he knows, or perhaps, I might add, how much less some other man knows."

"That is a rather unsatisfactory description."

"A mining expert is frequently a rather unsatisfactory person. But there is a difference in experts, as in other people, and perhaps it is but fair to remember that in forming their conclusions they have to deal with Nature in some of her most unaccountable and fantastic moods. The experience gained in examining ninety-nine different formations may be of no use in the one-hundredth. It is a business no man can say he has learned absolutely."

"Then why do they charge so much for knowledge which is not knowledge? Is it because of the risk to their reputations in saying a thing is true, while they really take the chance of its being otherwise?"

"Hardly that, I should say," said Bodewin, a little bored by the effort to give conscientious answers to questions that did not fit his mood, but willing to humor a pretty girl's thirst for information. "An honest expert charges for the responsibility he takes in giving such opinions as he is able to form from his experience and study. If the responsibility is great he charges accordingly."

Josephine was mentally referring Bodewin's words to her father's case,—a case where facts alone were called for, not experience or responsibility or study; and the five thou-

sand dollars her father had offered, and Bodewin had refused, would suggest, in spite of herself, a very ugly word.

Mr. Hillbury, from the other side of the fire, leaned forward and threw on it another log. The wind veered and carried the smoke of the augmented flame into their faces. They scrambled, laughing, to their feet, and retreated, Bodewin dragging the blanket after him. He spread it down again on the windward side of the fire, but Josephine did not seem disposed to resume her seat.

They were hovering about in that fascinating borderland between firelight and moonlight. The moon had risen high enough to fill the thin woods with its light; but it was a pale, suffused radiance by contrast with the red fire-glow. The wind in the tree-tops over their heads, like a circle of unseen whisperers, closed around the lightly joined thread of their talk.

"Do people ever get used to this?" Josephine asked.

"I am afraid they do. But they enjoy it over again, as I do to-night, seeing your fresh eyes take it all in for the first time."

"How do you know that I like it? I have not said so, have I?"

"I can see that you do."

"I do, I do!" she said, in her full, cordial tones. "But not all of it."

"No; there is too much of it to be all good." After a pause he asked: "Your father is making a longer stay in the camp than he intended, is he not?"

"Yes; we were to have gone this week. He will wait now until after the trial."

"I hope he will gain his suit," Bodewin said civilly.

"Do you?" came involuntarily from Josephine.

"Why are you surprised, Miss Newbold, to find my sympathies on the side of justice?"

"I did not know you thought that was our side," Josephine replied coldly.

"I do think so."

"Then if you care about justice, why don't you go into court and say so?"

Josephine looked at him, hardly less astonished than he at her own words. It was undeniably careless of Bodewin to have assumed that Miss Newbold knew nothing of his connection with her father's lawsuit. And Josephine, under the pressure of her own misgivings, had allowed herself to be goaded by his cool allusion into an extraordinary liberty. So she instantly felt it to be, and so she knew that he also regarded it. He looked at her keenly and gravely.

"You must not answer that question," she said. "I had no right to ask it."

"Perhaps you had not," he assented. "You will pardon me if I do not answer it."

"You will only humiliate me if you do."

Neither found it easy to go on talking as they had talked before. By a common impulse they moved back towards the camp, and when they rejoined the circle around the fire, Josephine contrived that her seat should be as far away as possible from Bodewin. Her evening was spoiled — and more than that. She did not ask herself what more, but miserably she felt what a fire is the tongue that is not disciplined. It had not occurred to her before whether she was likely or not to meet Bodewin again, but now she found herself earnestly hoping that she might. She longed to retrieve herself, for the sake of her own self-respect. Mr. Hillbury was telling a story in his low, pleasant tones and matter-of-fact manner that heightened the effect of his climaxes. She tried to fix her attention upon it, and sat with a strained half-smile on her face and her eyes on the speaker, never looking at or speaking to Bodewin again, except to say good-evening to him in her quietest manner when the company broke up.

Bodewin lingered after the other guests had gone and smoked another pipe with Hillbury. The latter remarked upon Miss Newbold's beauty. It was too obvious to call for discussion, though Hillbury invited one by saying that she was too unconscious to be thoroughly graceful, and that to him she seemed like a preposterously handsome boy.

"Oh, come!" said Bodewin. "If she were a *coquette* with that face and figure, where should we be? Heaven is merciful, after all!"

When the pipe was finished Bodewin took his way along the ditch walk alone. The Craig cabin was dark as he passed it. He stopped on the foot-bridge and leaned upon the rail, watching the current slide under the shadow of the bridge and out again into the light. A reflection of the moon, now high overhead, floated in the black water of the ditch. It wavered and widened and shrunk, as the water shifted its levels under the golden gleam. It struck Bodewin as a rather dreary thing that he should have been so startled by a girl's impulsive question. It showed how seldom girls had taken the trouble to ask him questions, even uncomplimentary ones, about himself. Absolutely, out of the processions of fair, unapproachable women, to whom all his life he had been a stranger, not one had ever stepped aside to challenge his slightest individual action, seriously and from an ethical point of view. He had had the usual temptations which come to men through women. A fair one now and then had smiled at him, or so he had fancied, from the virgin

ranks, and her blithe glances had made riot in his breast for a brief space, though he had not greatly admired the generosity or greatly coveted the giver. But this was a departure of a different sort. He half distrusted it, — as a man with a conscience inevitably distrusts his neighbor who reminds him of it, — but he could not distrust the girl herself. Newbold's daughter! What precious unknown quantity had gone to complete that equation! Well, it wasn't so disagreeable for a first experience of the kind. Its novelty was not its only charm. He half wished, now that it was too late, that he had tried to answer her question, and so admitted in some sort her right to ask it. It might have ended in a rather piquant flirtation on high moral grounds, since they were to be so much longer together in the camp; but now there was small likelihood of any concession on her part. She had without doubt the true woman's art to punish a man for her own offense against him.

V.

AN OFFSET TO THE DINNER.

MISS NEWBOLD'S opportunity to retrieve herself came, not many days later, through the innocent machinations of Mrs. Craig. Mrs. Craig also wished to retrieve herself. She had given the Newbolds a bad dinner. Atonement was out of the question where Mr. Newbold was concerned, unless it might be through making Mr. Newbold's daughter happy. Her head had not touched her pillow, the night after the dinner, before it began comparing rides and walks and excursions in various directions, with a view to Miss Newbold's amusement. Chance, after all, decided her choice. Mr. Hillbury offered a professional errand of his own as an excuse for a ride half-way to the top of one of the famed peaks of the neighboring range. A party was quickly made up. Mr. Newbold at the outset declined to attempt a twenty-mile ride on horseback including a good deal of mountain work; but he was obviously pleased with the plan, for his daughter's sake. Bodewin was invited, Mrs. Craig informing him that he was expected to supply those minor passages without which a pleasure party, like dance music, is flat.

"We are all monotonously major, every one of us, — Mr. Hillbury, Miss Newbold, Joe, and myself. You must come along and change the key."

The riders made an early start from the Wiltie House. Mr. Newbold stood on the curbstone and watched them out of sight, Josephine taking the lead, with Mr. Craig on

her right and Hillbury on her left, followed by Mrs. Craig with Bodewin beside her, on his bald-faced bay. Half a mile beyond the camp they left the stage-road for one of the many stony trails which climbed the sides of the gulch, branching in various directions towards as many different mines. Always ascending northward, they crossed the belt of burned timber and entered the dark and fragrant spruce woods, the last and toughest growth on the mountain-side. Here they rode singly in a green twilight chinked with golden lights. The trail was barely distinguishable; the horses' hoofs fell with a soft thud on the thick-sifted layers of spruce needles, or struck, with a hollow ring, the trunk of a fallen tree in stepping over it. No bird-calls broke the stillness; no sounds of any kind betrayed the small furtive activities of forest inhabitants. It was late, even for the season of wild flowers fed from the cold-bosomed snows of the range. A few patches of the inextinguishable fire-weed lighted the dim slopes; and occasionally, beside the trail, there bloomed in its weird beauty a poppy-shaped flower on a long hair-like stem with petals colored like the wings of a lunar moth.

From time to time Josephine, riding ahead, tried the silence shyly with her voice. It was a voice with one or two exquisite notes in it beside the note, ever welcome, of youth. It was like a human response to the dumb litany of the forest. Josephine was happy to be on horseback in a new and singularly interesting,

if not always beautiful region. The keen edge had passed from her mortification with regard to Bodewin. She was content to let him keep his impressions of her, however unfortunate they might be, without any effort on her part to correct them, so long as a morning as perfect as this found her still in tune. So healthy and so honest a girl could not keep her head low because of a single slip, which hurt her through her delicacy rather than her conscience, and merely affected her passing relations with a stranger. In forgiving herself, she forgave Bodewin and was at peace with the world. Nevertheless, stranger as he was, she wished, before he drifted out of her life altogether, that he could be cleared of the reproach which still clung to him in her thoughts. Was it through listlessness merely and vain obliviousness that he kept silent when the truth was demanded of him? Was it likely that in the past his life-threads had become entangled with those of Harkins—a man whom common report called an unscrupulous rogue, though a merry one, and generous enough with his spoils when won? What could there be in common between them? Yet she constantly heard it said that Bodewin would not appear against Harkins. Why not? Well, let it go! She was sure to do some one, perhaps more than one, some horrible injustice in her thoughts, if she let them dwell on this subject, which had already proved a pitfall to her discretion.

(To be continued.)

Mary Hallock Foote.

ON NEARING WASHINGTON.

CITY of homes and in my heart my home,
 Though other streets exact a grudging fee:—
 How leap my pulses when afar I see
 The dawn creep whitening down thy solemn dome!
 For now my care-restricted steps may roam
 Thy urban groves—a forest soon to be—
 Where, like thy shining river, placid, free,
 Contentment dwells and beckons me to come.

Ah, city dear to lovers!—that dost keep
 For their delight what Mays and what Novembers!—
 Kindling the flame, and if it ever sleep,
 New-lighting it within the breathing embers;
 Dear even in their sorrow! for when they weep
 'Tis for rare joys, scarce known till Love remembers.

Robert Underwood Johnson.

THE UNITED CHURCHES OF THE UNITED STATES.

THEIR EXISTING AGREEMENT IN DOCTRINE, POLITY, AND WORSHIP.

THE associative tendency of the Christian masses has shown itself wherever they could act freely together. In our own country for more than a hundred years there has been a steady effort after religious unity, following the political movement through the successive stages of the colonization, the confederation, the constitution, and the recent consolidation of the United States. During the colonial period the few mission churches scattered along the Atlantic coast were temporarily fused together by the evangelistic labors of Whitefield and Wesley. In the revolutionary war they were simply massed and compacted in the common struggle for civil as well as religious freedom. Since the declaration of independence we have seen them at first separately organizing themselves, and then spontaneously combining in great common causes, such as the American Bible Society, the American Tract Society, the American Sunday School Union, the American Boards of Domestic and Foreign Missions, as well as the various moral reforms in which they became leagued against vice and infidelity on the platform of their common Christianity. In the late civil war they appeared as one holy phalanx of charity and mercy in the Sanitary and Christian commissions; and at the present time they are interlaced by a network of Young Men's Christian Associations, Inter-Denominational Alliances and Church Congresses, designed to combine them practically in Christian work and intercourse, to say nothing of inter-ecclesiastical councils, based upon organic bonds of unity between kindred churches.

It is true that all such compacts, being temporary expedients, as fast as they serve their purposes must decay and disappear; and it is also true that in some cases the dissolution of a league of churches has been followed by their seeming recoil and reassertion of sectarian peculiarities in more pronounced form than ever, as may now be seen in the various boards of charity and missions maintained by the different denominations. But it will be found at the same time that another set of causes has been tending, if not to bring them together again in closer bonds and on a more enduring basis, yet at least to reveal to them, more and more clearly, the ultimate grounds of a true organic unity.

By the organic unity of churches is here meant such unity as inheres in their internal organization, and is traceable in their forms of doctrine, government, and worship, as well as in their whole historic life and development; and is not, therefore, due to any mere artificial arrangement or conscious effort. Institutions are not made, but grow; and sometimes they grow so slowly that one generation rejects as irrational and visionary what the next generation accepts as the logic of events. Whole churches, as well as states, have thus been reasoned out of the divine right of English monarchy and American slavery; and it is safe to assume that any scheme of ecclesiastical union which could now be devised, even though the true one, would be repudiated, perhaps by all existing denominations, as involving the suppression of some essential truth or the sacrifice of some valuable principle. We are not yet ready for such schemes, and it would only be a waste of time to discuss them. The first lesson to be learned is that the unification of the American churches, if it is ever to come at all, cannot be precipitated by platforms, coalitions, compromises, in short by any mere external association of the different denominations, which leaves them still without internal modification and vital connection, as true and living branches of the Vine of Christ.

How then is such organic unity or union ever to be reached? Perhaps we can trace a rough likeness between the case of the American churches at the present time and that of the American states at the close of the revolution. The articles of confederation had proved a rope of sand. The colonies, in becoming independent of the British crown, had also become independent of one another, and with their diverse creeds, institutions, races, and climates, seemed on the verge of anarchy. It was not until they had surrendered some of their sovereign attributes and readjusted their whole domestic polity, that they could come into the more perfect union of the constitution; and ever since then they have been racked with internal conflicts, until at last welded together by the fiery blows of civil war. In like manner the different denominations, after having been loosely confederated in various compacts and alliances, are falling apart in fresh estrangement, wasting their resources in

mere propagandism, and often wrangling over time-worn theological issues in the face of their common foes. And now, it is thought by some, they can only be driven together again by the rod of persecution. The peace of Westphalia, they will tell us, was but a truce, and the warfare once waged between the Catholic and Protestant powers of Europe is yet to be decided by some terrible intestine struggle within our own borders, fulfilling the great Armageddon of the Apocalypse. With the sects thus cast into the furnace of affliction, to be purged of their errors, and melted and molded to one likeness, the church militant is at length to come forth from the ordeal united and triumphant.

We need not, however, push a mere political analogy so far. Rather may we hope that the age of religious wars is past, and that any remaining issues between religious parties are to be fought out, not with carnal weapons, but with spiritual. Certainly the American churches have at least gained all the freedom that they need. Free of the state and free of one another, they may now peacefully work out their respective missions without let or hindrance. But whilst thus left to the combined action of providential events and spiritual causes, it is inevitable that in the long future they will undergo much modification, perhaps gradual assimilation to each other, or to some one divine model towards which they are tending. Despite their present divided and distracted appearance, if we will survey them from a high outside point of view, in a Christian, philosophical mood, we shall discern amongst them vast unifying tendencies which have been operating quietly through successive generations, and which can only be measured by comparing one period of their history with another. We can no more control such tendencies than we can control the winds of heaven. It is the part of wisdom to recognize them and shape our course by means of them. We need not forsake our respective positions; we cannot force an immediate harmony of views; but at least we may profitably engage in a study of the existing germs or grounds of organic unity in the American churches.

In entering upon this study, whatever theories of the Church we may severally hold, we should lay aside even just prejudices, so far as to take into view impartially the various Christian bodies claiming an ecclesiastical title and jurisdiction, which are coextensive with the nation, or which may be otherwise due them in courtesy, such as the "Evangelical Lutheran Church in North America," the "Methodist Episcopal Church of America" (Northern and Southern), the "Presbyterian Church in the United States" (Northern and

Southern), the "Protestant Episcopal Church in the United States," the "Reformed Church in America" (Dutch), the "Reformed Church in the United States" (German), the "Roman Catholic Church," the "United Brethren" (German and Moravian), the "United Presbyterian Church of America," the "Universalist Church in the United States," the "Baptist Churches" (Calvinistic and Arminian), the "Congregational Churches" (Trinitarian), the "Disciples of Christ" (Campbellite), the "Society of Friends," the "Unitarian Churches." Some of these bodies, and others which might have been named, are considerable in numbers and influence, and not likely to play any chief part in the development of American Christianity. Confining our attention to the great Christian denominations of the country, we may fairly concede to them the possession of ecclesiastical elements more or less perfectly organized; and our task will be to look into their respective forms of doctrine, of polity, and of worship, in search of the three corresponding grounds of unity which are afforded by their *dogmatic agreement*, their *ecclesiastical* or *political likeness*, and their *liturgical culture*.

The first of these three grounds of unity is the least hopeful. Perfect consent in theological views, were it attained between the different denominations, might indeed issue in their perfect union, if not in one and the same organization, since among other doctrines it would include the same doctrine of church polity; but it may be doubted if such consent is in the nature of the case attainable. Doctrinal distinctions are largely due to the paradoxical relations of essential truths which are alike derived from Holy Scripture, as well as to original diversities in human nature which are alike legitimate. Accordingly they appeared among the Apostles themselves in the two schools of St. Paul and St. Peter; they were renewed among the church-fathers by Augustine and Pelagius; they were reaffirmed among the schoolmen by Thomas Aquinas and Dun Scotus; they were emphasized among the reformers by Calvin and Arminius; they were early transferred to our own churches by Whitefield and Wesley, and have since spread with enormous growth over the whole continent; and they are likely to continue in some form until the end of the world.

If history teaches anything plainly, it shows that the attempt to organize churches on the basis of mere dogmatic distinctions will always tend to schism rather than to unity. They often exclude more true Christians than they include, and sooner or later go to pieces in some fresh dissension. And even more difficult would it be to connect together conflicting

churches on such a basis. It is certain that none of the leading Protestant confessions, not the Augsburg, not the Belgic or Heidelberg, not the Westminster, not the Thirty-nine Articles would now be generally accepted by the American churches. It is doubtful if any of the great Catholic creeds, the Athanasian, the Nicene, or even the Apostles' Creed, would afford a platform broad enough to embrace all the denominations calling themselves Christian. And still less could they be marshalled together by any of the new-made creeds of our own time and country.

Nor can it be said that such attempts as have hitherto been made at a dogmatic confederation of churches have been very successful or promising. The Evangelical Alliance of Protestant churches, though based upon a partial consent in doctrine, takes a polemical attitude by its very name against the Roman Catholic Church. The proposed league of the Protestant Episcopal and Russian Greek churches would have excluded all the other Protestant churches, besides covertly involving the gravest doctrinal differences. Even the Presbyterian churches in their late general council could not reach a consensus of their own kindred standards. The Congregational churches, discarding all the old creeds, are engaged in framing a new one. And other large family groups of churches, such as the Baptist and the Methodist, show but few signs of either agreeing among themselves or seeking agreement with the rest of the American churches.

To see how complex is the problem before us, we should need only to bring together the various creeds and confessions for comparison and contrast and arrange them in their degrees of difference between the extremes of Catholicism and Protestantism. It would be found, at the first view, that the points of variance are simply endless, embracing a variety of opinions upon numerous questions in every department of sacred science, theology, anthropology, christology, soteriology, ecclesiology, eschatology. On closer examination we would see that the two extremes of Unitarianism and Romanism, in their latest outcome, would utterly refuse to coalesce, consenting in nothing but the few articles of natural religion which Christianity has in common with Judaism and Paganism. Next, we would find that between these extremes the chief evangelical confessions, whilst agreeing with the Roman Catholic creeds in some essential doctrines, such as the trinity, the incarnation, the atonement, disagree with them in others no less essential, and still further disagree among themselves by all the differences known to Lutheranism, Calvinism, Arminianism. Then,

we would discover that the Lutheran, Calvinistic, and Arminian confessions, though largely consentient as to the chief essential doctrines termed evangelical, are most widely dissentient as to some relatively non-essential doctrines, such as are held by Episcopalians, Presbyterians, and Congregationalists. And, lastly, we would see that it is precisely some one of these non-essential doctrines which each denomination puts in the front as its standard, claims as the source of its life and the only reason for its existence, and often cherishes as an inherited faith, hallowed by the blood of martyrs and endeared by all the associations of home and kindred. In a word, the concords of American creeds would be so drowned and lost in their discords as to leave us hopeless of anything like a true doctrinal harmony.

From this showing of the case, it is plain that the utmost we can hope for is some ultimate consensus which cannot now be formulated into a common creed of the churches, but must be largely matter of surmise and speculation. We may assume, not unreasonably, that it will exhibit the essential faith in distinction from the non-essential, and exalt the great things in which Christians agree above the small things in which they differ; and we may expect, on good grounds, that in the course of its evolution some dogmas will be sloughed off as erroneous, others reduced to a relative importance, and still others left indifferent. But we cannot hope to see it start forth at one blow as a feat of logic by some ambitious peace-maker, or even carefully wrought out as a piece of legislative wisdom by some advanced body of divines met to adjust the disputes of Christendom. Rather must we look forward to it as to a coming survival of truth over error, to be slowly evolved from the present conflict of opinion, in the general progress of Christian knowledge, and through a growing spirit of Christian freedom, charity, tolerance and catholicity.

It is a cheering remark of Dr. Schaff, at the close of his survey of the creeds of Christendom, "that the age of separation and division is passing away, and the age of the reunion of divided Christendom is beginning to dawn." Glance at some of the grounds of this inspiring hope here in our country. In the first place, we should not overlook the doctrinal agreement already known and expressed, such as the consent of the Roman Catholic and some Protestant churches in the Athanasian, Nicene, and Apostles' creeds; the consent of the Lutheran and Moravian churches in the Augsburg confession; the consent of the various Episcopal churches, the Protestant, the Meth-

odist, the Reformed, in the Thirty-Nine Articles; the consent of the Congregational, the Baptist, and the various Presbyterian churches in the Westminster Standards, together with the indorsement by the reunited Presbyterian Church of the Heidelberg catechism of the Dutch and German Reformed churches. In the second place, we may find some tendencies to a doctrinal agreement between these different groups of churches,—in their American revisions of these various standards which show, now and then, a slight though unsought mutual approximation; in their fraternal intercourse, which always brings into view a large latent consent in the great evangelical doctrines of our common Christianity; in their very controversies, which often serve only to show how trifling is their dissensus as compared with their fundamental consensus; and even in their heretical departures, which sometimes express that consensus with a primitive simplicity free from the scholastic technicality of the old creeds, whilst their pulpit expositions of it are ever setting it forth with scriptural freedom, freshness, and power. And lastly, we may everywhere discern the signs of a waning interest in the mere dogmatic distinctions, which have long hindered the growth and assertion of a true doctrinal agreement,—such as the decline of theological controversy in the New England churches; the disappearance of the old and new schools in the reunited Presbyterian Church; the comprehension of doctrinal differences within the Episcopal Church, and the rise of Broad church parties in other churches; the spread of open communion in the Baptist churches; the liberty of preaching in the Methodist Church; the allowance of heretical departures in many churches up to the point of scandal; the searching revision of creeds in the light of modern thought and science; the disuse of the old scholastic catechisms, the decay of polemic preaching, and the growing preference for evangelical themes of a moral and practical purport. Through the silent action of such causes, it may yet happen in some distant future, not indeed that all dogmas shall be obliterated, but subordinated and graduated in harmony with the one universal faith. Even now, could the American churches, leaving their existing standards unchanged, be simply confederated in a formal profession of the Nicene or Apostles' creed, in which most of them might readily join, their denominational dogmas would at once sink towards a proper relative value, their essential consensus would begin to emerge into view, and so far forth they would appear to the world as the *United Churches of the United States*.

The second and more hopeful ground of unity is that of ecclesiastical likeness or affinity in church government. The problem is no longer to produce agreement as to the whole mass of dogmas, but only a single doctrine or set of doctrines of minor importance except when made by some extreme view to involve other more essential doctrines. And it would seem easier to secure external attachment to an ecclesiastical polity than internal unanimity in all the endless points of theological science. Experience has shown that Christians who agree in scarcely anything else may hold the same views of church government and even dwell together in the same organization. The church has often included different schools of theology, but no school of theology ever yet included the whole church. Indeed, it is a common reproach of Protestantism that in its grand effort for freedom and progress, it has given birth to a medley of jarring sects, by exaggerating doctrinal differences which had been allowed and adjusted within the pale of the church from the Apostles' time until the Reformation. And that such outward ecclesiastical unity may be more than the mere enforced uniformity or feigned conformity, so often charged against state-churches, might be proved by examples in free churches where no political restraints have been imposed. Even conflicting churches, the most unlike in their dogmatic standards, Lutheran, Calvinistic, Arminian, Socinian, may be found substantially alike in their ecclesiastical organization.

In order to bring into view these latent affinities of the American churches, we may conveniently group them in three great classes according to their structural likeness: First, Congregational, those which make each local congregation self-governed and independent, such as the Baptist, the Unitarian, and the Orthodox churches; Second, Presbyterian, those which unite congregations under presbyteries composed of representative clergymen and laymen, such as the Lutheran, the Dutch and German Reformed, and the various Presbyterian churches; Third, Episcopal, those which subordinate both congregations and presbyteries to bishops as a higher order of clergymen, such as the Methodist, the Protestant, and the Reformed Episcopal, the Moravian, and the Roman Catholic churches. It will be seen at a glance that these three classes, when viewed together, present a scale rising from the simplest to the most complex forms of polity, and on closer inspection it would be found that each higher class includes the lower with more or less modification, Presbyterian churches being not without Congregational elements and Episcopal churches being not without Presbyterian elements.

Nor can it be said that some organic union of these more or less kindred organizations would be wholly beyond analogy and precedent. In less than two hundred years the world has seen a medley of incongruous polities, theocratic, monarchic, democratic, aristocratic, grow up into that cluster of homogeneous republics known as the United States, by a series of transforming events,—first by the ascendancy of the Protestant over the Catholic powers in North America, then by the revolutionary destruction of the royal and proprietary charters in the colonies, and at last by a vindicated constitution forever guaranteeing the freedom of states, classes, and races. And so complete a political metamorphosis could not but affect the religious bodies which have been more or less involved in it. Freed thereby from the papal supremacy, from a foreign establishment, and from all connection with our own government, they were at the same time freed from the causes which once drove them asunder, and brought under the causes which have since drawn them together. Not only has each group of kindred churches been fraternizing and coalescing, Congregational with Congregational, Presbyterian with Presbyterian, Episcopal with Episcopal, but the different groups have been growing like each other in their structure as well as in their aim and spirit. Congregational churches, no longer in conflict with a Presbyterian parliament and monarchy, have themselves been becoming Presbyterian with their series of representative associations, consociations, conferences, and councils, and their facile combination with Presbyterian bodies in fit emergencies. Presbyterian churches, delivered from a prelatical peerage as well as from state patronage, have been allowing Congregational freedom in their parishes and adopting Episcopal elements in their overseeing boards, agencies, and secretaryships, as well as becoming pervaded with church tendencies. Episcopal churches, freed from royal control and left wholly self-dependent, have been admitting Presbyterian deputies, clerical and lay, into their diocesan conventions and standing committees, and otherwise curtailing the extraneous powers of the episcopate; whilst some churchmen have almost stript it of doctrinal significance and left it with a mere expediential or political value, as a sort of Episcopal Presbyterianism or so-called Congregationalism tinged with Episcopacy. Reformed Episcopalians interpret the Ordinal in the sense of the early Presbyterian school of Archbishop Usher. Methodist Episcopalians also hold to an Episcopacy without apostolic succession, and have adopted lay-representation as well as lay-preaching in their administrative policy. The Moravians practically

tend to a kind of Presbyterian Episcopacy. Even the Roman Catholics, at the late Plenary Council, seem to have taken the first step towards bringing their Episcopal system into formative contact with republican institutions. At the same time the average American layman has a growing dislike of hierarchical orders and exclusive pretensions. With the exception of the Anglican and Roman Catholic churchmen who claim a divine right and special grace in their own ministry, the chief Christian bodies have been fast becoming congruous in polity as well as consentient in doctrine. It is conceivable that these assimilative changes may go on, together with lessening dogmatic differences, until all existing ecclesiastical distinctions shall have become more superficial than fundamental, more nominal than real, if not themselves be merged in some comprehensive polity which shall be at once Congregational, Presbyterian, and Episcopal, and wherein Protestant freedom and intelligence shall appear reconciled with Catholic order and authority. Already, indeed, were it possible for the leading denominations to give visible expression to their own hidden structural unity by acts of mutual recognition, organic connection, and coöperative charity, like the scattered bones which Ezekiel saw coming together into a great army they would at once start into new life and activity as the *United Churches of the United States*.

Hitherto we may seem to have been investigating grounds of unity which are obscure and only lead out into a visionary future; but the one still to be considered — liturgical culture — belongs to our own time, and calls for practical thought and action.

It would seem that the first step towards true church unity must be liturgical rather than doctrinal or strictly ecclesiastical. Christians who differ cannot begin to agree until they come together in the region of devout feeling and are thus predisposed to brotherly concord. Hence it was amid the Pentecostal fervors in the early church that all divisions of race, language, lineage, sect and party became for the time effaced; and ever since then it has been found that in the fire of true devotion the sternest sectarian feuds melt away and are forgotten. People of all creeds, Calvinists, Arminians, Episcopalians, Presbyterians, Baptists, Methodists, can and do unite in performing the same acts of worship, in observing the same sacraments, and in commemorating the same religious events. And such devotions are not confined to times and scenes of revival excitement. When they have become expressed liturgically in time-hallowed hymns and prayers which breathe the common

Christian heart of all ages, in significant rites and emblems which set forth the essential Christian faith in all churches, and in annual festivals which thrill the whole Christian world with the consciousness of great Christian facts and doctrines, there is then afforded a permanent practical communion of saints between different denominations.

It is such a liturgical fusion that has long been going on amongst us, hidden and unnoticed. The great historical churches, whose doctrinal standards have remained fixed for generations and whose ecclesiastical bounds are still jealously guarded, have meanwhile been so modifying their service-books and insensibly so interchanging their modes of worship that now, with scarce a thought of any incongruity, Catholic creeds are recited in Protestant assemblies, Anglican rites are couched in Lutheran forms, Presbyterian prayers are intoned by Episcopalian priests, Wesleyan hymns are sung after Calvinistic sermons, portions of High Mass are chanted by Covenanter choirs, and Puritan cathedrals are decked with Christmas evergreens and Easter flowers. It is in fact no longer possible to ignore a deep and wide-spread liturgical movement pervading the leading denominations like a groundswell and threatening some day to upheave and bury out of sight the sectarian differences in which the popular mind has ceased to take interest. The general demand, as we are often told by the secular press, is for more of Christian life and worship and less of a mere metaphysical and polemical theology. The people, not content with having the choicest literature and oratory in the sermon, are calling for the aids of music and architecture in the service and secretly revolting from a mode of worship in which a theological lecture is the one all-absorbing feature and by which feeling has been divorced from expression, devotion from art, and doctrine from every-day life. In some denominations, as in the Lutheran, the Dutch and German Reformed, the Presbyterian and the Methodist, their own defunct liturgies have been restored or republished and brought into discussion; whilst in others attempts are made to construct new formularies, without regard to antiquity, catholicity or authority. At the same time, the Protestant Episcopal Church has been reaping a harvest of conversions not likely to have been made upon strictly dogmatic grounds, and is itself already engaged in the timely work of enriching the prayer-book and adapting it to American life and institutions.

It would be a great mistake to think this whole movement due to the clergy alone or even confined to the educated and fashionable classes. In some churches the people have

been acquiring the liturgical culture which once belonged only to the priest and choir, and can say or sing in English the *Gloria, Te Deum*, etc., whose Latin titles show their origin. Where such culture is not found, the plainest and rudest, gathered in slums or in the backwoods, seem glad to become active worshippers instead of mere passive listeners, and to have their devotion enkindled through the senses and the imagination as well as the intellect and conscience. And as if to insure such a culture in the future, the whole rising generation in our Sunday-schools is being trained into a liturgical habit by a crude lectionary, responsive psalter, recited prayers, and often all the appliances of a dramatic ritual.

Even those who do not sympathize with the movement have ceased to deride it, and exchanging indifference for grave astonishment at its portentous bearing are casting about for means of explanation and resistance. By many of them it will no doubt be summarily set down to the account of our original depravity, as due to a general decline of vital religion, or to the increase of wealth, luxury, and fashion, or to the demoralizing influences of a civil war, or to some merely temporary excess or aberration of modern civilization. After duly allowing for such causes, however, we may still accept the new development as a necessary and in the main a sound reaction of the Protestant mind from an extreme into which it was driven under the impulse of the Reformation,—an extreme which was unavoidable in so great a religious revolution and which was needed at the time for the purification of European Christianity and for the colonization of the American churches, but which, now that those great ends have been attained, may well give place to some more moderate and reasonable course. In other words, it would seem the true policy neither to ignore nor to oppose this reactionary tendency, but to candidly recognize what is true and valuable in it, to indicate its needed checks and safeguards and to provide for its legitimate gratification. We need not renounce existing Protestantism as a failure; we cannot accept existing Catholicism as a success; but surely we may look somewhere between these extremes for the path of wisdom and safety.

On surveying the present state of religious culture we shall find two conflicting theories of worship, in neither of which exclusively is the great body of Christian people likely to abide. The one, for want of a better word, has been called revivalism; the other is known as ritualism. The one would take exalted religious sentiment amounting to rapture as the normal state of every worshipping con-

gregation; the other aims at the outward expression of religious sentiment in a ceremonial and artistic form, with the view of impressing the mind through the imagination and the senses. The most perfect example of revivalism, the one to which it constantly appeals for its warrant, was the rapt assembly at Pentecost, with its many-tongued psalmists and inspired prophets, its transports and fervors and miraculous conversions. The typical illustration of ritualism, and that to which it naturally reverts for its model, was the mediæval cathedral, with its supposed reënactment of the great tragedy of the Cross, amid all the æsthetical influences of architecture, sculpture, painting, music, and eloquence. Whilst the affinities of revivalism are with new and rude populations, which have neither the means nor the taste for literary and artistic modes of worship, the tendencies to ritualism are found in older and richer communities, whose culture and art must sooner or later permeate their religious as well as domestic and social life.

Now, it is enough thus to fairly state the two theories in order to see that neither can hope to exterminate its opposite, or arrogate to itself the whole truth in respect to the vital matter of Christian worship. Too often their respective advocates have proceeded upon such an assumption, until they have simply become incapable of appreciating each other. The mere revivalist has ended in decrying all artistic culture as essentially irreligious, and conceiving it to be impossible for refined and fashionable people to be as good Christians as himself, whilst the mere ritualist has at length reduced his whole religion to a fine art, and learned to look upon all other manifestations of religious feeling as vulgar rant and hypocrisy. But the history of Christianity shows that neither tendency can be safely pushed to an extreme. Even in the primitive church the revival spirit, with all the advantage of miraculous gifts, gave rise to so shocking abuses that the Apostles enjoined a more decorous and formal mode of worship, and often since then, when not wisely checked and guided, it has fostered a spasmodic type of piety, consisting of nervous exaltations, followed by dreary collapses, destructive of all normal church growth and healthy Christian activity. In like manner the ritualistic spirit very soon began to harden the simple usages of primitive worship into an elaborate ceremonial to which all the arts contributed, until the church became a temple of the Christian Muses; and in our day even that earnest expression of a once living belief has sometimes given place to a mere scenic symbolism akin in effect to the spectacular drama.

At the same time, notwithstanding these extremes, the essential good that is in each tendency is still apparent. It would be folly to treat as mere morbid excitement such a great religious awakening as that which attended the preaching of Whitefield and Wesley when like new apostles they traversed the American colonies, kindling them into a flame of devotion; and on the other hand it would be almost an insult to argue that liturgies foster a low type of Christian faith and practice, in view of so illustrious examples as Bernard, Herbert, Taylor, and Keble. In our own time much of the earnest working Christianity of the Church of England has gone into the ritualistic party, and in our own country a high order of liturgical service may be found associated not only with faithful pulpits, but with city charities and frontier missions. Even the evangelists, Moody and Sankey, resort to a kind of crude ritualism in their revival meetings, whilst the ritualist Fathers Maturin and Knox-Little tincture their ritual with a kind of mild revivalism. The simple truth is that both tendencies are legitimate and valuable within the limits which they impose upon each other. There are churches, especially those still doing pioneer work, in which revival methods must long prevail; and there may be times in the history of all churches when such methods will be needed to refresh their languid faith, and quicken them into new life; but for the ordinary sound states of feeling in churches becoming replenished with learning and culture, the need of a more or less literary and artistic form of worship presents itself as a foregone conclusion for which due provision should be made.

It will be easy at this point to sneer at literary and artistic tastes as weak and trivial compared with religious interests. That is not the question: that may be granted. Nevertheless, the faculties used in the cultivation of letters and the fine arts, small as they may be, are an original part of human nature and essential to a fully developed manhood. Unless they be simply obliterated they must somehow share in the regenerative power of the Christian faith, and find their due place in any symmetrical scheme of Christian nurture. Neglect them or train them apart from religious ideas and influences, and sooner or later they will ally themselves with vice and superstition, and at length appear in some terrible Nemesis of faith like that which avenged the Puritan rigor with the licentious reign of Charles II. Moreover, it has become a practical question how to deal with them. The culture which has invaded our homes cannot be kept out of our churches. In fact it has already come into

them, and come to stay. If we will not go back to the Puritan meeting-house, the Covenanter psalm-singing, the Methodist camp-meeting, the Quaker silence, we must go forward to some new adjustment of the advanced civilization and Christianity of our day.

Precisely what that adjustment should be, how far the contemporaneous literature and art of a community can be wisely admitted within the sphere of Christian worship, it might not be easy to decide as an abstract question. Practically, however, as we have seen, it is being settled for us by the course of providential events, by the spontaneous working and interaction of the two interests. The much-dreaded corruption of religion by science, of piety by art, of devotion by taste, has not come to pass. Allowing for exceptions, we may fearlessly claim just the opposite result. Pulpits as orthodox and steadfast as any of the last generation are to-day reinforced with all the stores of modern literature, and applying Scripture doctrine, as never before, to current questions in trade, morals, politics, and philosophy. Congregations, as devout and earnest as any once gathered in the barn-like chapel or imitated Greek temple, are now worshipping in Christian buildings amid Christian emblems and legends, and with the aid of choir and organ offering up the glorias and canticles of a Christian ritual. In short, churches which have been longest on the soil and most fairly express our national life and social growth, without any loss of their early purity and zeal, and without the least compromise of their distinctive orthodoxy, are adopting all the elements of liturgical worship.

Leaving it to appear hereafter how much of this movement is crude and rash and likely to pass away, we come at once to the practical questions, How is it to be met and satisfied? Where to does it tend? And to the former question the answer is plain, that it can not be met and satisfied by new-made liturgies or patchwork services. Such expedients proceed upon a misconception of the true liturgic ideal as an historical growth and flower of the piety of the whole church in all lands and ages. In distinction from extemporaneous worship, a liturgy is a system for both minister and people of fixed forms of prayer and praise, of administering rites and ceremonies, of methodically reading the Holy Scriptures, of commemorating Christian events and doctrines, together with any literary and artistic aids which may be afforded by the existing state of religious culture. Such a system cannot be made by one man, in a day. To attempt it would be to set at nought the wisdom of eighteen centuries of Christian worship. It would

be the absurdity of composing new hymns as well as prayers, of framing new creeds, of celebrating the Lord's Supper, baptism, matrimony and burial with new ceremonies, of constructing tables of Scripture lessons which have never been tested, and of instituting Christian festivals of which the church has never heard. It is something like this absurdity which is perpetrated whenever a liturgymaker sits down in his study to write out an original and complete formulary for the use of his people or of his denomination, in ignorance, and sometimes in contempt of the devotional treasures which have been accumulating for ages.

And scarcely any better is the incongruous mixture sometimes made of liturgical with extemporaneous worship. Each is good in its own place, and either in place is better than the other out of place. In social prayer-meetings, especially during times of revival, the prayers, hymns, and exhortations will be free and spontaneous, and anything like a liturgy would be felt as an intolerable bondage; but in large assemblies on public occasions there must be more of method and formality, and it would seem a strange impropriety, when we think of it, to improvise stated, ordinary acts of divine service, to extemporize the administration of solemn rites, to express the moods and wants of but one individual out of a thousand people and often leave their most essential devotions to his chance impulse. And yet something very much like this will be endured by intelligent congregations who have taken steps to formalize their worship in some respects but not in others; who will come together for impromptu services in a cathedral-like structure adapted to ritual uses; who will insist upon a carefully written sermon, but sit listless through long desultory prayers; who will let their children read the same appointed Scripture lesson with all the Sunday-schools in Christendom, but have their own public reading of God's word arranged, if arranged at all, on some occult principle known to the minister alone; who will grope after him through a service supposed to be introductory to the unknown theme of his sermon; who will only join him intelligently in saying a Psalter which was meant to be sung, or have his unmeditated effusions mixed with a few liturgical forms, such as the Lord's Prayer, the Apostles' Creed, the Commandments, the Glorias, torn piecemeal from their only proper liturgical connection; who will keep anniversary days and weeks of prayer by human appointment, but discard the observance of Lent as without divine warrant, or perhaps celebrate Christmas, Good Friday and Easter as mere public or social incidents, without regard to the Christian

year in which they find their true significance ; in a word, who will seek to blend fragments of the ancient liturgy with an otherwise informal service. The wonder is that the two can live together, and it would seem certain that sooner or later one or the other will have to be abandoned.

This brings us to the other practical question as to the issue of the liturgical movement, and the answer is already at hand,—it must have its logical conclusion in the English prayer-book as the only Christian liturgy worthy of the name. I do not forget the Lutheran, Dutch and German Reformed and early Presbyterian formularies, each admirable in its own day and for its own purpose ; and were it at all likely that any of them could now come into general use among our churches, it might be well to pause and estimate their claims. But on their face it will be seen that, being of foreign origin and modern translation, they are wanting in the quaint classical English of the age of Shakspeare, as well as in that solemn Scriptural style which is so desirable in order to separate the phrase of public worship from that of ordinary literature and conversation. Moreover, in their structure it will be found that they break more entirely with Christian antiquity than would now be deemed desirable, whilst their own contents, as we shall see, have been largely included in the prayer-book compilation, together with other forms of still greater liturgical value.

Let it be here premised that by the English prayer-book in this essay is meant the liturgy of the Church of England as it has existed substantially for more than three hundred years, long before any of the American churches had come into being, and that liturgy chiefly in distinction from the Articles and the Ordinal, with neither of which is it indissolubly connected, as is shown, not only by their separate origin and use, but also by the existence of other versions representing other views of doctrine and polity, Calvinistic, Arminian, Socinian, Presbyterian, Methodist, and Congregational. For the main purpose of this argument the Protestant Episcopal edition, with which we are happily so familiar, need not be taken specially into account, but our attention simply fixed upon that ancient service, whose structure and contents have remained essentially the same through all the revisions to which it has been subjected and amid all the varieties in which it is still extant.

The English liturgy, next to the English Bible, is the most wonderful product of the Reformation. The very fortunes of the book are the romance of history. As we trace its development, its rubrics seem dyed in the blood of martyrs ; its offices echo with polemic

phrases ; its canticles mingle with the battle-cries of armed sects and factions ; and its successive revisions mark the career of dynasties, states, and churches. Cavalier, covenant, and puritan have crossed their swords over it ; scholars and soldiers, statesmen and churchmen, kings and commoners, have united in defending it. England, Germany, Geneva, Scotland, America, have by turns been the scene of its conflicts. Far beyond the little island which was its birthplace, its influence has been silently spreading in connection with great political and religious changes, generation after generation, from land to land, even where its name was never heard.

At first sight, indeed, the importance which this book has acquired may seem quite beyond its merits, as the Bible itself might appear to a superficial observer a mere idol of bigotry and prejudice. But the explanation is in both cases somewhat the same. It is to be found in the fact that the prayer-book, like the sacred canon, is no merely individual production, nor even purely human work, but an accumulation of choice writings, partly divine, partly human, expressing the religious mind of the whole ancient and modern world, as enunciated by prophets and apostles, saints and martyrs, and formulated by councils, synods, and conferences, all seeking heavenly light and guidance. Judaism has given to it its lessons and psalter ; Christianity has added its epistles and gospels ; Catholicism has followed with its canticles, creeds, and collects ; and Protestantism has completed it with its exhortations, confessions, and thanksgivings. At the same time each leading phase of the reformation has been impressed upon its composite materials. Lutheranism has molded its ritual ; Calvinism has framed its doctrine ; Episcopalianism has dominated both ritual and doctrine ; whilst Presbyterianism has subjected each to thorough revision. And the whole has been rendered into the pure English and with the sacred fervor peculiar to the earnest age in which it arose ; has been wrought into a system adapted to all classes of men through all the vicissitudes of life ; and has been tested and hallowed by three centuries of trial in every quarter of the globe.

It would be strange if a work which thus has its roots in the whole Church of the past should not be sending forth its branches into the whole Church of the future ; and any one who will take the pains to study its present adaptations, whatever may have been his prejudices, must admit that there is no other extant formulary which is so well fitted to become the rallying-point and standard of modern Christendom. In it are to be found the means, possibly the germs, of a

just reorganization of Protestantism as well as an ultimate reconciliation with true Catholicism, such a catholicism as shall have shed everything sectarian and national, and retained only what is common to the whole Church of Christ in all ages and countries. Whilst to the true Protestant it offers evangelical doctrine, worship, and unity on the terms of the Reformation, it still preserves for the true Catholic the choicest formulas of antiquity, and to all Christians of every name opens a liturgical system at once Scriptural and reasonable, doctrinal and devotional, learned and vernacular, artistic and spiritual. It is not too much to say that were the problem given, to frame out of the imperfectly organized and sectarian Christianity of our times a liturgical model for the communion of saints in the one universal church, the result might be expressed in some such compilation as the English Book of Common Prayer.

This ideal fitness of the work to serve as the nucleus of a reunited Christianity will especially appear in the American churches, if we view it in connection with their historical origin and their present condition. In the first place, it sustains historical relations to those churches, which, though forgotten or obscured, are vital and enduring. Owing to the mode of its compilation from other liturgies, the very materials out of which it was at first formed have an organic affinity for the various ecclesiastical elements which now lie around it in this country as *dissecta membra*, as yet unassimilated and discordant. Whilst its Catholic or ancient portions, derived from the Greek and Latin churches, may be regarded as the common heritage of all Christians, its Protestant portions can be traced back to their sources in those Reformed churches of Germany, Geneva, Holland, Scotland and England in which the American churches have severally originated; and were they now disposed to any formal correspondence or union, they would only have to come together in the light of their common history in order to see that the English prayer-book, next to the Holy Scriptures, affords the closest visible bonds between them. The Evangelical Lutheran church, besides recognizing in it some of the ancient Catholic formulas which she has also retained, could find in the offices of baptism, matrimony, and burial large portions of the liturgies of Luther, Melancthon, and Bucer. The Reformed churches (Dutch and German) could refer important parts of the daily prayer and communion service to a common origin with their own liturgies in the formularies of Calvin, Lasco, and Pollanus. The Presbyterian church, whose standards were framed mainly by presbyters of the

Church of England in the Westminster Assembly, could not only discern in the articles of religion the original skeleton of her confession of faith, but trace through the entire liturgy her revising hand, and might regain a living embodiment of her directory of worship in that amended prayer-book which some of her own founders strove to establish two centuries ago. The Protestant Episcopal church, the only church that has faithfully kept and honored the whole book among us, after guarding her connection with the Anglican, Latin, and Greek churches, might also acknowledge her large indebtedness to other Protestant churches, now in a position, as never before, to recognize and respect their mutual relationship. The Methodist Episcopal church, which herself originated in an Oxford movement, besides deriving the model of her polity from the Ordinal, still retains the prayer-book as edited and authorized by Wesley. Even the Congregational churches (Trinitarian, Unitarian, Baptist), though without the same historical continuity, might look for broken links in the Westminster catechisms and King's Chapel prayer-book, as well as in the early Puritan revisions before the rise of Independency. In fact nearly all the leading denominations, were they to retrace their history, would come back to the English liturgy as a work which their ecclesiastical forefathers did not so much aim to destroy as to amend; which they finally abandoned only in the larger interest of civil and religious freedom; and which they might now, in the changed circumstances of another age and country, easily resume and modify without the least sacrifice of denominational pride or logical consistency.

If this picture seem strange and visionary, let it be observed, in the second place, that the American churches for some time past have been steadily, though unconsciously, drifting back toward the midway position held by the English prayer-book between the extremes of Catholic and Protestant Christianity. Whilst the European churches, Roman, Anglican, Scotch, Dutch, German, have for several centuries remained fixed in their original seats as state religions, with but little intercourse and mutual modification, the American churches meanwhile, escaping from these narrow confines, have migrated to another hemisphere, become compacted together under a republican form of government, made free and equal before the law, and left to their own spontaneous development. The result is that they have been slowly rebounding from the rash extremes into which they were driven by sectarian warfare in the Old World, and, no longer held apart by political restraints, are

now under common impulses tending towards substantial unity in the midst of trivial diversity. In matters of order and worship, here and there, they have actually exchanged positions in their recoil, and come nearer to each other than to their respective mother churches on the other side of the Atlantic. Presbyterians have been adopting the liturgical usages which once kindled the wrath of Jenny Geddes into a revolution of the three kingdoms, whilst Episcopalians have been admitting the lay elements which brought Archbishop Laud to the scaffold. Congregationalists are reproducing the church buildings which their ancestors defaced as Popish chapels, whilst American churchmen are proposing to make the old Puritan Thanksgiving a holy day in the Church year. Baptist ministers have begun to borrow from a prayer-book which John Bunyan renounced for the Elstow jail, whilst neighboring rectors have engaged in prayer-meetings which the bishops of that day would have legally suppressed as a crime. Methodist congregations, founded by John Wesley, have costly churches, service-books, and written sermons, whilst the Oxford reformers of to-day have surpliced lay-readers, clerical exhorters, and ritual missions. Not long since an association of city ministers devised a "non-Episcopal observance of Lent," whilst Lenten revivals were being conducted by a Protestant order of priests. The whole Christian world is alive with such changes, and becoming visibly marshaled for the issue. On the one side are the various Protestant churches, already beginning to resume those portions of the prayer-book which were once falsely associated with tyranny and superstition, and in spite of inherited prejudices, exploring anew the whole field of Catholic antiquity; and it would be strange indeed if these enlightened Christian bodies, thus moving in the line of great historical causes, should pause in the midst of so inevitable reactions. On the other side are the Roman and Anglican churches, no longer able to bind up the Catholic portions of the prayer-book with hierarchy and social caste, but themselves permeated as never before with the influences of Protestant freedom and culture; and it remains to be seen whether even these least pliable types of organized Christianity must not yet yield to the pressure of democratic institutions and the plastic force of American society. Be that as it may, so long as the religious, political, and social influences by which the different denominations are being sifted and fused together continue to operate amongst them, they will in various

degrees unitedly approximate a Catholicism which shall be truly Protestant, as well as a Protestantism which shall be truly Catholic. In a word, if we are ever to have anything answering to the grand conception of the *United Churches of the United States*, it must come through that spirit of Protestant Catholicism of which the English liturgy, properly amended and enriched, would be the best conceivable embodiment.

And now the very process of such a liturgical concretion of different denominations about the nucleus of the prayer-book has reached a point where it only waits accomplishment. Bring together the fragments of that ancient liturgy as preserved by some churches, or coming into use in others, and recombine them as they may be found in its various offices; restore more fully the links of the Christian year, which are already socially and legally recognized among us, and let them be illustrated by the epistles and gospels which have marked their circuit for centuries past; arrange the present random lessons so that the whole Scriptures may be publicly read in their inspired connection; reduce the rambling "long prayer" to the lucid order and fullness of the Litany, and add a few well-chosen collects from the best liturgies; purge existing hymnals of their copious doggerel and enrich them only with hymns which have become classical; at the same time scrupulously retain a learned pulpit and the liberty of extemporaneous worship for fit times and occasions;—and the result would be an American liturgy expressing the essential common faith of Catholic and Protestant Christianity.

The general conclusion of our study is now before us: a doctrinal compact of the American churches can only be looked for in the distant future; their ecclesiastical confederation may be nearer at hand; but their liturgical fusion is passing before our eyes towards its only logical issue in the prayer-book. How such a fusion is likely to affect the relations existing between the Protestant Episcopal Church and other American churches; whether it will leave those relations unchanged or at length lead to more mutual recognition and organic connection;—are interesting questions which may here force themselves into some minds; but they are not the most urgent questions growing out of the investigation; they belong, as we have seen, to the future rather than to the present; and they are quite aside from the main object of this essay. I have simply aimed to present certain facts and truths to those who are deeply interested in knowing them.

Charles W. Shields.

THE BOSTONIANS.*

BY HENRY JAMES,

Author of "Portrait of a Lady," "Daisy Miller," "Lady Barberina," etc.

XXXIV.

"I PRESUME you are the only person in this country who feels as you do," she remarked at last.

"Not the only person who feels so, but very possibly the only person who thinks so. I have an idea that my convictions exist in a vague, unformulated state in the minds of a great many of my fellow-citizens. If I should succeed some day in giving them adequate expression I should simply put into shape the slumbering instincts of an important minority."

"I am glad you admit it's a minority!" Verena exclaimed. "That's fortunate for us poor creatures. And what do you call adequate expression? I presume you would like to be President of the United States?"

"And breathe forth my views in glowing messages to a palpitating Senate? That is exactly what I should like to be; you read my aspirations wonderfully well."

"Well, do you consider that you have advanced far in that direction, as yet?" Verena asked.

This question, with the tone in which it happened to be uttered, seemed to the young man to project rather an ironical light upon his present beggarly condition, so that for a moment he said nothing; a moment during which, if his neighbor had glanced round at his face, she would have seen it ornamented by an incipient blush. Her words had for him the effect of a sudden, though, on the part of a young woman who had of course every right to defend herself, a perfectly legitimate taunt. They appeared only to repeat in another form (so at least his exaggerated Southern pride, his hot sensibility, interpreted the matter) the idea that a gentleman so dreadfully backward in the path of fortune had no right to take up the time of a brilliant, successful girl, even for the purpose of satisfying himself that he renounced her. But the reminder only sharpened his wish to make her feel that if he had renounced, it was simply on account of that same ugly, accidental, outside backwardness; and if he had not, he went so far as to flatter himself, he might triumph over the whole accumulation of her prejudices—over all the

bribes of her notoriety. The deepest feeling in Ransom's bosom in relation to her was the conviction that she was made for love, as he had said to himself while he listened to her at Mrs. Burrage's. She was profoundly unconscious of it, and another ideal, crude and thin and artificial, had interposed itself; but in the presence of a man she should really care for, this false, flimsy structure would rattle to her feet, and the emancipation of Olive Chancellor's sex (what sex was it, great heaven? he used profanely to ask himself) would be relegated to the land of vapors, of dead phrases. The reader may imagine whether such an impression as this made it any more agreeable to Basil to have to believe it would be indelicate in him to try to woo her. He would have resented immensely the imputation that he had done anything of that sort yet. "Ah! Miss Tarrant, my success in life is one thing—my ambition is another!" he exclaimed, presently, in answer to her inquiry. "Nothing is more possible than that I may be poor and unheard of all my days; and in that case no one but myself will know the visions of greatness I have stifled and buried."

"Why do you talk of being poor and unheard of? Aren't you getting on quite well in this city?"

This question of Verena's left him no time, or at least no coolness, to remember that to Mrs. Luna and to Olive he had put a fine face on his prospects, and that any impression the girl might have about them was but the natural echo of what these ladies believed. It had to his ear such a subtly mocking, defiant, unconsciously injurious quality, that the only answer he could make to it seemed to him for the moment to be an outstretched arm, which, passing round her waist, should draw her so close to him as to enable him to give her a concise account of his situation in the form of a deliberate kiss. If the moment I speak of had lasted a few seconds longer I know not what monstrous proceeding of this kind it would have been my difficult duty to describe; it was fortunately arrested by the arrival of a nursery-maid pushing a perambulator and accompanied by an infant who toddled in her wake. Both the nurse and her companion gazed fixedly, and it seemed to

Ransom even sternly, at the striking couple on the bench; and meanwhile Verena, looking with a quickened eye at the children (she adored children), went on —

"It sounds too flat for you to talk about your remaining unheard of. Of course you are ambitious; any one can see that, to look at you. And once your ambition is excited in any particular direction, people had better look out. With your will!" she added, with a curious mocking candor.

"What do you know about my will?" he asked, laughing a little awkwardly, as if he had really attempted to kiss her — in the course of the second independent interview he had ever had with her — and been rebuffed.

"I know it's stronger than mine. It made me come out, when I thought I had much better not, and it keeps me sitting here long after I should have started for home."

"Give me the day, dear Miss Tarrant, give me the day," Basil Ransom murmured; and as she turned her face upon him, moved by the expression of his voice, he added, — "Come and dine with me, since you wouldn't lunch. Are you really not faint and weak?"

"I am faint and weak at all the horrible things you have said; I have lunched on abominations. And now you want me to dine with you? Thank you; I think you're cool!" Verena cried, with a laugh which her chronicler knows to have been expressive of some embarrassment, though Basil Ransom did not.

"You must remember that I have, on two different occasions, listened to you for an hour, in speechless, submissive attention, and that I shall probably do it a great many times more."

"Why should you ever listen to me again, when you loathe my ideas?"

"I don't listen to your ideas; I listen to your voice."

"Ah, I told Olive!" said Verena, quickly, as if his words had confirmed an old fear; which was general, however, and did not relate particularly to him.

Ransom still had an impression that he was not making love to her, especially when he could observe, with all the superiority of a man — "I wonder whether you have understood ten words I have said to you?"

"I should think you had made it clear enough — you had rubbed it in!"

"What have you understood, then?"

"Why, that you want to put us back further than we have been at any period."

"I have been joking; I have been piling it up," Ransom said, making that concession unexpectedly to the girl. Every now and then he had an air of relaxing himself, becoming absent, ceasing to care to discuss.

She was capable of noticing this, and in a moment she asked — "Why don't you write out your ideas?"

This touched again upon the matter of his failure; it was curious how she couldn't keep off it, hit it every time. "Do you mean for the public? I have written many things, but I can't get them printed."

"Then it would seem that there are not so many people — so many as you said just now — who agree with you."

"Well," said Basil Ransom, "editors are a mean, timorous lot, always saying they want something original, but deadly afraid of it when it comes."

"Is it for papers, magazines?" As it sunk into Verena's mind more deeply that the contributions of this remarkable young man had been rejected — contributions in which, apparently, everything she held dear was riddled with scorn — she felt a strange pity and sadness, a sense of injustice. "I am very sorry you can't get published," she said, so simply that he looked up at her, from the figure he was scratching on the asphalt with his stick, to see whether such a tone as that, in relation to such a fact, were not "put on." But it was evidently genuine, and Verena added that she supposed getting published was very difficult always; she remembered, though she didn't mention, how little success her father had, when he tried. She hoped Mr. Ransom would keep on; he would be sure to succeed at last. Then she continued, smiling, with more irony: "You may denounce me by name if you like. Only please don't say anything about Olive Chancellor."

"How little you understand what I want to achieve!" Basil Ransom exclaimed. "There you are — you women — all over; always meaning yourselves, something personal, and always thinking it is meant by others!"

"Yes, that's the charge they make," said Verena, gayly.

"I don't want to touch you, or Miss Chancellor, or Mrs. Farrinder, or Miss Birdseye, or the shade of Eliza P. Moseley, or any other gifted and celebrated being on earth — or in heaven."

"Oh, I suppose you want to destroy us by neglect, by silence!" Verena exclaimed, with the same brightness.

"No, I don't want to destroy you, any more than I want to save you. There has been far too much talk about you, and I want to leave you alone altogether. My interest is in my own sex; yours evidently can look after itself. That's what I want to save."

Verena saw that he was more serious now than he had been before, that he was not piling it up satirically, but saying really and

a trifle wearily, as if suddenly he were tired of much talk, what he meant. "To save it from what?" she asked.

"From the most damnable feminization! I am so far from thinking, as you set forth the other night, that there is not enough woman in our general life, that it has long been pressed home to me that there is a great deal too much. The whole generation is womanized; the masculine tone is passing out of the world; it's a feminine, a nervous, hysterical, chattering, canting age, an age of hollow phrases and false delicacy and exaggerated solicitudes and coddled sensibilities, which, if we don't soon look out, will usher in the reign of mediocrity, of the feeblest and flattest and the most pretentious that has ever been. The masculine character, the ability to dare and endure, to know and yet not fear reality, to look the world in the face and take it for what it is,—a very queer and partly very base mixture,—that is what I want to preserve, or rather, as I may say, to recover; and I must tell you that I don't in the least care what becomes of you ladies while I make the attempt!"

The poor fellow delivered himself of these narrow notions (the rejection of which by leading periodicals was certainly not a matter for surprise) with low, soft earnestness, bending towards her so as to give out his whole idea, yet apparently forgetting for the moment how offensive it must be to her now that it was articulated in that calm, severe way, in which no allowance was to be made for hyperbole. Verena didn't remind herself of this; she was too much impressed by his manner and by the novelty of a man taking that sort of religious tone about such a cause. It told her on the spot, from one minute to the other and once for all, that the man who could give her that impression would never come round. She felt cold, slightly sick, though she replied that now he summed up his creed in such a distinct, sober way, it was much more comfortable—she knew with what one was dealing; a declaration much at variance with the fact, for Verena had never felt less gratified in her life. The ugliness of her companion's profession of faith made her shiver; it would have been difficult to her to imagine anything more crudely cynical. She was determined, however, not to betray any shudder that she could suggest weakness, and the best way she could think of to disguise her emotion was to remark in a tone which, although not assumed for that purpose, was really the most effective revenge, inasmuch as it always produced on Ransom's part (it was not peculiar, among women, to Verena) an angry helplessness—"Mr. Ransom, I assure you this is an age of conscience."

"That's a part of your cant. It's an age of unspeakable shams, as Carlyle says."

"Well," returned Verena, "it's all very comfortable for you to say that you wish to leave us alone. But you can't leave us alone. We are here, and we have got to be disposed of. You have got to put us somewhere. It's a remarkable social system that has no place for *us*!" the girl went on, with her most charming laugh.

"No place in public. My plan is to keep you at home, and have a better time with you there than ever."

"I'm glad it's to be better; there's room for it. Woe to American womanhood when you start a movement for being more—what you like to be—at home!"

"Dear me! how you're perverted; you, the very genius!" Basil Ransom murmured, looking at her with the kindest eyes.

She paid no attention to this, she went on, "And those who have got no home (there are millions, you know), what are you going to do with *them*? You must remember that women marry—are given in marriage—less and less; that isn't their career, as a matter of course, any more. You can't tell them to go and mind their husband and children, when they have no husband and children to mind."

"Oh," said Ransom, "that's a detail! And for myself, I confess, I have such a boundless appreciation of your sex in private life that I am perfectly ready to advocate a man's having a half a dozen wives."

"The civilization of the Turks, then, strikes you as the highest?"

"The Turks have a second-rate religion; they are fatalists, and that keeps them down. Besides, their women are not nearly so charming as ours—or as ours would be if this modern pestilence were eradicated. Think what a confession you make when you say that women are less and less sought in marriage; what a testimony that is to the pernicious effect on their manners, their person, their nature, of this ridiculous agitation."

"That's very complimentary to me!" Verena broke in, lightly.

But Ransom was carried over her interruption by the current of his argument. "There are a thousand ways in which any woman, all women, married or single, may find occupation. They may find it in making society agreeable."

"Agreeable to men, of course."

"To whom else, pray? Dear Miss Tarrant, what is most agreeable to women is to be agreeable to men! That is a truth as old as the human race, and don't let Olive Chancellor persuade you that she and Mrs. Farinder have invented any that can take its place, or that is more profound, more durable."

Verena waived this point of the discussion ; she only said : " Well, I am glad to hear you are prepared to see the place all choked up with old maids ! "

" I don't object to the *old* old maids ; they were delightful ; they had always plenty to do, and didn't wander about the world crying out for a vocation. It is the new old maid that you have invented from whom I pray to be delivered." He didn't say he meant Olive Chancellor, but Verena looked at him as if she suspected him of doing so ; and to put her off that scent he went on, taking up what she had said a moment before : " As for its not being complimentary to you, my remark about the effect on the women themselves of this pernicious craze, my dear Miss Tarrant, you may be quite at your ease. You stand apart, you are unique, extraordinary ; you constitute a category by yourself. In you the elements have been mixed in a manner so felicitous that I regard you as quite incorruptible. I don't know where you come from nor how you come to be what you are, but you are outside and above all vulgarizing influences. Besides, you ought to know," the young man proceeded, in the same cool, mild, deliberate tone, as if he were demonstrating a mathematical solution, " you ought to know that your connection with all these rantings and ravings is the most unreal, accidental, illusory thing in the world. You think you care about them, but you don't at all. They were imposed upon you by circumstances, by unfortunate associations, and you accepted them as you would have accepted any other burden, on account of the sweetness of your nature. You always want to please some one, and now you go lecturing about the country, and trying to provoke demonstrations, in order to please Miss Chancellor, just as you did it before to please your father and mother. It isn't *you*, the least in the world, but an inflated little figure (very remarkable in its way too) whom you have invented and set on its feet, pulling strings, behind it, to make it move and speak, while you try to conceal and efface yourself there. Ah, Miss Tarrant, if it's a question of pleasing, how much you might please some one else by tipping your preposterous puppet over and standing forth in your freedom as well as in your loveliness ! "

While Basil Ransom spoke — and he had not spoken just that way yet — Verena sat there deeply attentive, with her eyes on the ground ; but as soon as he ceased she sprang to her feet — something made her feel that their association had already lasted quite too long. She turned away from him as if she wished to leave him, and indeed were about to attempt to do so. She didn't desire to look

at him now, or even to have much more conversation with him. " Something," I say, made her feel so, but it was partly his curious manner — so serene and explicit, as if he knew the whole thing to an absolute certainty — which partly scared her and partly made her feel angry. She began to move along the path to one of the gates, as if it were settled that they should immediately leave the place. He laid it all out so clearly ; if he had had a revelation he couldn't speak otherwise. That description of herself as something different from what she was trying to be, the charge of want of reality, made her heart beat with pain ; she was sure, at any rate, it was her real self that was there with him now, where she oughtn't to be. In a moment he was at her side again, going with her ; and as they walked it came over her that some of the things he had said to her were far beyond what Olive could have imagined as the very worst possible. What would be her state now, poor forsaken friend, if some of them had been borne to her in the voices of the air ? Verena had been affected by her companion's speech (his manner had changed so ; it seemed to express something quite different) in a way that pushed her to throw up the discussion, and determine that as soon as they should get out of the park she would go off by herself ; but she still had her wits about her sufficiently to think it important she should give no sign of discomposure, of confessing that she was driven from the field. She appeared to herself to notice and reply to his extraordinary observations enough, without taking them up too much, when she said, tossing the words over her shoulder at Ransom, while she moved quickly : " I presume, from what you say, that you don't think I have much ability."

He hesitated before answering, while his long legs easily kept pace with her rapid step — her charming, touching, hurrying step, which expressed all the trepidation she was anxious to conceal. " Immense ability, but not in the line in which you most try to have it. In a very different line, Miss Tarrant ! Ability is no word for it ; it's genius ! "

She felt his eyes on her face — ever so close and fixed there — after he had chosen to reply to her question that way. She was beginning to blush ; if he had kept them longer, and on the part of any one else, she would have called such a stare impertinent. Verena had been commended of old by Olive for her serenity " while exposed to the gaze of hundreds " ; but a change had taken place, and she was now unable to endure the contemplation of an individual. She wished to detach him, to lead him off again into the general ; and for

this purpose, at the end of a moment, she made another inquiry: "I am to understand, then, as your last word that you regard us as quite inferior?"

"For public, civic uses, absolutely — perfectly weak and second-rate. I know nothing more indicative of the muddled sentiment of the time than that any number of men should be found to pretend that they regard you in any other light. But privately, personally, it's another affair. In the realm of family life and the domestic affections —"

At this Verena broke in, with a nervous laugh: "Don't say that; it's only a phrase!"

"Well, it's a better one than any of yours," said Basil Ransom, turning with her out of one of the smaller gates of the park, the first they had come to. They emerged into the species of *plaza* formed by the numbered street which constitutes the southern extremity of the park and the termination of the Sixth Avenue. The glow of the splendid afternoon was over everything, and the day seemed to Ransom still in its youth. The bowers and boscages stretched behind them, the artificial lakes and cockneyfied landscapes making all the region bright with the sense of air and space, and raw natural tints, and vegetation too diminutive to overshadow. The chocolate-colored houses, in tall, new rows, surveyed the expanse; the street-cars rattled in the foreground, changing horses and absorbing and emitting passengers; and the beer-saloons, with exposed shoulders and sides, which in New York do a good deal towards representing the picturesque, the "bit" appreciated by painters, announced themselves in signs of large lettering to the sky. Groups of the unemployed, the children of disappointment from beyond the seas, propped themselves against the low, sunny wall of the park; and on the other side the commercial vista of the Sixth Avenue stretched away with a remarkable absence of aerial perspective.

"I must go home; good-bye," Verena said, abruptly, to her companion.

"Go home? You won't come and dine, then?"

Verena knew people who dined at midday and others who dined in the evening, and others still who never dined at all; but she knew no one who dined at half-past three. Ransom's attachment to this idea therefore struck her as queer and infelicitous, and she supposed it betrayed the habits of Mississippi. But that couldn't make it any more acceptable to her, in spite of his looking so disappointed — with his dimly glowing eyes — that he was heedless for the moment that the main fact connected with her return to Tenth street was that she wished to go alone.

"I must leave you, right away," she said. "Please don't ask me to stay; you wouldn't if you knew how little I want to!" Her manner was different now, and her face as well, and though she smiled more than ever she had never seemed to him more serious.

"Alone, do you mean? Really I can't let you do that," Ransom replied, extremely shocked at this sacrifice being asked of him. "I have brought you this immense distance, I am responsible for you, and I must place you where I found you."

"Mr. Ransom, I must; I will!" she exclaimed, in a tone he had not yet heard her use; so that, a good deal amazed, puzzled, and pained, he saw that he should make a mistake if he were to insist. He had known that their expedition must end in a separation which couldn't be sweet, but he had counted on making some of the terms of it himself. When he expressed the hope that she would at least allow him to put her into a car, she replied that she wished no car; she wanted to walk. This image of her "streaking off" by herself, as he figured it, did not mend the matter; but in the presence of her sudden nervous impatience he felt that here was a feminine mystery which must be allowed to take its course.

"It costs me more than you probably suspect, but I submit. Heaven guard you and bless you, Miss Tarrant!"

She turned her face away from him as if she were straining at a leash; then she rejoined, in the most unexpected manner: "I hope very much you *will* get printed."

"Get my articles published?" He stared, and broke out: "Oh, you delightful being!"

"Good-bye," she repeated; and now she gave him her hand. As he held it a moment, and asked her if she were really leaving the city so soon that she mightn't see him again, she answered: "If I stay it will be at a place to which you mustn't come. They wouldn't let you see me."

He had not intended to put that question to her; he had set himself a limit. But the limit had suddenly moved on. "Do you mean at that house where I heard you speak?"

"I may go there for a few days."

"If it's forbidden to me to go and see you there, why did you send me a card?"

"Because I wanted to convert you then."

"And now you give me up?"

"No, no; I want you to remain as you are!"

She looked strange, with her more mechanical smile, as she said this, and he didn't know what idea was in her head. She had already left him, but he called after her, "If you do stay, I will come!" She neither turned nor made an answer, and all that was left to him

was to watch her till she passed out of sight. Her back, with its charming young form, seemed to repeat that last puzzle, which was almost a challenge.

For this, however, Verena Tarrant had not meant it. She wanted, in spite of the greater delay and the way Olive would wonder, to walk home, because it gave her time to think, and think again, how glad she was (really, positively, *now*) that Mr. Ransom was on the wrong side. If he had been on the right — ! She didn't finish this proposition. She found Olive waiting for her in exactly the manner she had foreseen; she turned to her, as she came in, a sufficiently terrible face. Verena instantly explained herself, related exactly what she had been doing; then went on, without giving her friend time for question or comment: "And you — you paid your visit to Mrs. Burrage?"

"Yes, I went through that."

"And did she press the question of my coming there?"

"Very much indeed."

"And what did you say?"

"I said very little, but she gave me such assurances —"

"That you thought I ought to go?"

Olive was silent a moment, then she said: "She declares they are devoted to the cause, and that New York will be at your feet."

Verena took Miss Chancellor's shoulders in each of her hands, and gave her back, for an instant, her gaze, her silence. Then she broke out, with a kind of passion: "I don't care for her assurances — I don't care for New York! I won't go to them — I won't — do you understand?" Suddenly her voice changed, she passed her arms round her friend and buried her face in her neck. "Olive Chancellor, take me away, take me away!" she went on. In a moment Olive felt that she was sobbing, and that the question was settled, the question she herself had debated in anguish a couple of hours before.

XXXV.

THE August night had gathered by the time Basil Ransom, having finished his supper, stepped out upon the piazza of the little hotel. It was a very little hotel and of a very slight and loose construction; the tread of a tall Mississippian made the staircase groan and the windows rattle in their frames. He was very hungry when he arrived, having not had a moment, in Boston, on his way through, to eat even the frugal morsel with which he was accustomed to sustain nature between a breakfast that consisted of a cup of coffee and a dinner that consisted of a cup of tea. He had had his cup of tea now,

and very bad it was, brought him by a pale, round-backed young lady, with auburn ringlets, a fancy belt, and an expression of limited tolerance for a gentleman who could not choose quickly between fried fish, fried steak, and baked beans. The train for Marmion left Boston at four o'clock in the afternoon, and rambled fitfully toward the southern cape, while the shadows grew long in the stony pastures, and the slanting light gilded the straggling, shabby woods, and painted the ponds and marshes with yellow gleams. The ripeness of summer lay upon the land, and yet there was nothing in the country Basil Ransom traversed that seemed susceptible of maturity; nothing but the apples in the little tough, dense orchards, which gave a suggestion of sour fruition here and there, and the tall, bright golden-rod at the bottom of the bare stone dykes. There were no fields of yellow grain; only here and there a crop of brown hay. But there was a kind of soft scrubbiness in the landscape, and a sweetness begotten of low horizons, of mild air, with a possibility of summer haze, of unregarded inlets where on August mornings the water must be brightly blue. Ransom had heard that the Cape was the Italy, so to speak, of Massachusetts; it had been described to him as the drowsy Cape, the languid Cape, the Cape not of storms, but of eternal peace. He knew that the two ladies from Charles street had been drawn thither, for the hot weeks, by its sedative influence, by the conviction that its toneless air would minister to perfect rest. In a career in which there was so much nervous excitement as theirs, they had no wish to be wound up when they went out of town; they were sufficiently wound up at all times by the sense of all their sex had been through. They wanted to live idly, to unbend and lie in hammocks, and also to keep out of the crowd, the rush of the watering-place. Ransom could see there was no crowd at Marmion, as soon as he got there, though indeed there was a rush, which directed itself to the only vehicle in waiting outside of the small, lonely, hut-like station, so distant from the village that, as far as one looked along the sandy, sketchy road which was supposed to lead to it, one saw only an empty land on either side. Six or eight men, in "dusters," carrying parcels and handbags, projected themselves upon the solitary, ricketty carry-all, so that Ransom could read his own fate, while the ruminating conductor of the vehicle, a lean, shambling citizen, with a long neck and a tuft on his chin, guessed that if he wanted to get to the hotel before dusk he would have to strike out. His valise was attached in a precarious manner to the rear of the carry-all. "Well, I'll

chance it," the driver remarked, sadly, when Ransom protested against its insecure position. He recognized the southern quality of that picturesque fatalism—judged that Miss Chancellor and Verena Tarrant must be pretty thoroughly relaxed if they had given themselves up to the genius of the place. This was what he hoped for and counted on, as he took his way, the sole pedestrian in the group that had quitted the train, in the wake of the overladen carry-all. It helped him to enjoy the first country walk he had had for many months, for more than months, for years, that the reflection was forced upon him as he went (the mild, vague scenery, just beginning to be dim with twilight, suggested it at every step) that the two young women who constituted, at Marmion, his whole prefigurement of a social circle, must, in such a locality as that, be taking a regular holiday. The sense of all the wrongs they had still to redress must be lighter there than it was in Boston; the ardent young man had, for the hour, an ingenuous hope that they had left their opinions in the city. He liked the very smell of the soil as he wandered along; cool, soft whiffs of evening met him at bends of the road which disclosed very little more—unless it might be a band of straight-stemmed woodland, keeping, a little, the red glow from the west, or (as he went farther) an old house, shingled all over, gray and slightly collapsing, which looked down at him from a steep bank, at the top of wooden steps. He was already refreshed; he had tasted the breath of nature, measured his long grind in New York, without a vacation, with the repetition of the daily movement up and down the long, straight city, like a bucket in a well or a shuttle in a loom.

He lit his cigar in the office of the hotel—a small room on the right of the door, where a "register," meagerly inscribed, led a terribly public life on the little bare desk, and got its pages dogs'-eared before they were covered. Local worthies, of a vague identity, used to lounge there, as Ransom perceived the next day, by the hour. They tipped back their chairs against the wall, seldom spoke, and might have been supposed, with their converging vision, to be watching something out of the window, if there had been anything at Marmion to watch. Sometimes one of them got up and went to the desk, on which he leaned his elbows, hunching a pair of sloping shoulders to an uncollared neck. For the fiftieth time he perused the fly-blown page of the recording volume, where the names followed each other with such jumps of date. The others watched him while he did so—or contemplated in silence some "guest" of the hostelry, when such a personage entered the

place with an air of appealing from the general irresponsibility of the establishment and found no one but the village philosophers to address himself to. It was an establishment conducted by invisible, elusive agencies; they had a kind of stronghold in the dining-room, which was kept locked at all but sacramental hours. There was a tradition that a "boy" exercised some tutelary function as regards the crumpled register; but when he was inquired about, it was usually elicited from the impartial circle in the office either that he was somewhere round or that he had gone a-fishing. Except the haughty waitress who has just been mentioned as giving Ransom his supper, and who only emerged at meal-times from her mystic seclusion, this impalpable youth was the single person on the premises who represented domestic service. Anxious lady-boarders, wrapped in shawls, were seen waiting for him, as if he had been the doctor, on horse-hair rocking-chairs, in the little public parlor; others peered vaguely out of back doors and windows, thinking that if he were somewhere round they might see him. Sometimes people went to the door of the dining-room and tried it, shaking it a little, timidly, to see if it would yield; then, finding it fast, came away, looking, if they had been observed, shy and snubbed, at their fellows. Some of them went so far as to say that they didn't think it was a very good hotel.

Ransom, however, didn't much care whether it was good or not; he hadn't come to Marmion for the love of the hotel. Now that he had got there, however, he didn't know exactly what to do; his course seemed rather less easy than it had done when, suddenly, the night before, tired, sick of the city air, and hungry for a holiday, he decided to take the next morning's train to Boston, and there take another to the shores of Buzzard's Bay. The little hotel itself offered few resources; the inmates were not numerous; they moved about a little outside on the small piazza and in the rough yard which interposed between the house and the road, and then they dropped off into the unmitigated dusk. This element, touched only in two or three places by a far-away dim glimmer, presented itself to Ransom as his sole entertainment. Though it was pervaded by that curious, pure, earthy smell which in New England, in summer, hangs in the nocturnal air, Ransom thought himself that the place might be a little dull for persons who had not come to it as he had to take possession of Verena Tarrant. The unfriendly inn, which suggested dreadfully to Ransom (he hated the practice) an early bed-time, seemed to have no relation to anything, not even to itself; but a fellow-tenant of whom he made an inquiry told him the

village was sprinkled round. Basil presently walked along the road in search of it under the stars, smoking one of the good cigars which constituted his only tribute to luxury. He reflected that it would hardly do to begin his attack that night; he ought to give the Bostonians a certain amount of notice of his appearance on the scene. He thought it very possible, indeed, that they might be addicted to the vile habit of "retiring" with the cocks and hens. He was sure that was one of the things Olive Chancellor would do so long as he should stay — on purpose to spite him; she would make Verena Tarrant go to bed at unnatural hours, just to deprive him of his evenings. He walked some distance without encountering a creature or discerning an habitation; but he enjoyed the splendid starlight, the stillness, the shrill melancholy of the crickets, which seemed to make all the vague forms of the country pulsate around him; the whole impression was a bath of freshness after the long strain of the preceding two years, and his recent sweltering weeks in New York. At the end of ten minutes (his stroll had been slow) a figure drew near him, at first indistinct, but presently defining itself as that of a woman. She was walking apparently without purpose, like himself, or without other purpose than that of looking at the stars, when she paused for an instant, throwing back her head, to contemplate as he drew nearer to her. In a moment he was very close; he saw her look at him, through the clear gloom, as they passed each other. She was small and slim; he made out her head and face, saw that her hair was cropped; had an impression of having seen her before. He noticed that as she went by she turned as well as himself, and that there was a sort of recognition in her movement. Then he felt sure that he had seen her elsewhere, and before she had added to the distance that separated them, he stopped short, looking after her. She noticed his halt, paused equally, and for a moment they stood there face to face, at a certain interval, in the darkness.

"I beg your pardon — is it Doctor Prance?" he found himself demanding.

For a minute there was no answer; then came the voice of the little lady.

"Yes, sir; I am Doctor Prance. Any one sick at the hotel?"

"I hope not; I don't know," Ransom said, laughing.

Then he took a few steps, mentioned his name, recalled his having met her at Miss Birdseye's, ever so long before (nearly two years), and expressed the hope that she had not forgotten that.

She thought it over a little — she was evi-

dently addicted neither to empty phrases nor to unconsidered assertions. "I presume you mean that night Miss Tarrant launched out so."

"That very night. We had a very interesting conversation."

"Well, I remember I lost a good deal," said Doctor Prance.

"Well, I don't know; I have an idea you made it up in other ways," Ransom returned, laughing still.

He saw her bright little eyes engage with his own. Staying, apparently, in the village, she had come out, bareheaded, for an evening walk, and if it had been possible to imagine Doctor Prance bored and in want of recreation, the way she lingered there as if she were quite willing to have another talk might have suggested to Basil Ransom this condition. "Why, don't you consider her career very remarkable?"

"Oh, yes; everything is remarkable nowadays; we live in an age of wonders!" the young man replied, much amused to find himself discussing the object of his adoration in this casual way, in the dark, on a lonely country road, with a short-haired female physician. It was astonishing how quickly Doctor Prance and he had made friends again. "I suppose, by the way, you know Miss Tarrant and Miss Chancellor are staying down here?" he went on.

"Well, yes, I suppose I know it. I am visiting Miss Chancellor," the dry little woman added.

"Oh, indeed? I am delighted to hear it!" Ransom exclaimed, feeling that he might have a friend in the camp. "Then you can inform me where those ladies have their house?"

"Yes, I guess I can tell it in the dark. I will show you round now, if you like."

"I shall be glad to see it, though I am not sure I shall go in immediately. I must reconnoiter a little first. That makes me so very happy to have met you. I think it's very wonderful — your knowing me."

Doctor Prance did not repudiate this compliment, but she presently remarked: "You didn't pass out of my mind entirely, because I have heard about you since, from Miss Birdseye."

"Ah, yes, I saw her in the spring. I hope she is in health and happiness."

"She is always in happiness, but she can't be said to be in health. She is very weak; she is failing."

"I am very sorry for that."

"She is also visiting Miss Chancellor," Doctor Prance observed, after a pause which was an illustration of an appearance she had of thinking that certain things didn't at all imply others.

"Why, my cousin has got all the distinguished women!" Basil Ransom exclaimed.

"Is Miss Chancellor your cousin? There isn't much family resemblance. Miss Birdseye came down for the benefit of the country air, and I am down to see if I could help her to get some good from it. She wouldn't much, if she were left to herself. Miss Birdseye has a very fine character, but she hasn't much idea of hygiene." Doctor Prance was evidently more and more disposed to be chatty. Ransom appreciated this fact, and said he hoped she, too, was getting some good from the country air,—he was afraid she was very much confined to her profession, in Boston; to which she replied,—“Well, I was just taking a little exercise along the road. I presume you don't realize what it is to be one of four ladies grouped together in a small frame house.”

Ransom remembered how he had liked her before, and he felt that, as the phrase was, he was going to like her again. He wanted to express his good-will to her, and would greatly have enjoyed being at liberty to offer her a cigar. He didn't know what to offer her or what to do, unless he should invite her to sit with him on a fence. He did realize perfectly what the situation in the small frame house must be, and entered with instant sympathy into the feelings which had led Doctor Prance to detach herself from the circle and wander forth under the constellations, all of which he was sure she knew. He asked her permission to accompany her on her walk, but she said she was not going much farther in that direction; she was going to turn round. He turned round with her, and they went back together to the village, in which he at last began to discover a certain consistency, signs of habitation, houses disposed with a rough resemblance to a plan. The road wandered among them with a kind of accommodating sinuosity, and there were even cross-streets, and an oil-lamp on a corner, and here and there the small sign of a closed shop with an indistinctly countrified lettering. There were lights now in the windows of some of the houses, and Doctor Prance mentioned to her companion several of the inhabitants of the little town, who appeared all to rejoice in the prefix of captain. They were retired ship-masters; there was quite a little nest of these worthies, two or three of whom might be seen lingering in their dim doorways, as if they were conscious of a want of encouragement to sit up, and yet remembered the nights in far-away waters when they wouldn't have thought of turning in at all. Marmion called itself a town, but it was a good deal shrunken since the decline in the ship-building interest; it turned out a good many vessels every year,

in the palmy days, before the war. There were ship-yards still, where you could almost pick up the old shavings, the old nails and rivets, but they were grass-grown now, and the water lapped them without anything to interfere. There was a kind of arm of the sea put in; it went up some way, it wasn't the real sea, but very quiet like a river; that was more attractive to some. Doctor Prance didn't say the place was picturesque, or quaint, or weird; but he could see that was what she meant when she said it was moldering away. Even under the mantle of night he himself gathered the impression that it had had a larger life, seen better days. Doctor Prance made no remark designed to elicit from him an account of his motives in coming to Marmion; she asked him neither when he had arrived nor how long he intended to stay. His allusion to his cousinship with Miss Chancellor might have served to her mind as a reason; yet, on the other hand, it would have been open to her to wonder why, if he had come to see the young ladies from Charles street, he was not in more of a hurry to present himself. It was plain Doctor Prance didn't go into that kind of analysis. If Ransom had complained to her of a sore throat, she would have inquired with precision, about his symptoms; but she was incapable of asking him any questions with a social bearing. Sociably enough, however, they continued to wander through the principal street of the little town, darkened in places by immense old elms, which made a blackness overhead. There was a salt smell in the air, as if they were nearer the water; Doctor Prance said that Olive's house was at the other end.

"I shall take it as a kindness if, for this evening, you don't mention that you have happened to meet me," Ransom remarked after a little. He had changed his mind about giving notice.

"Well, I wouldn't," his companion replied; as if she didn't need any caution in regard to making vain statements.

"I want to keep my arrival a little surprise for to-morrow. It will be a great pleasure to me to see Miss Birdseye," he went on, rather hypocritically, as if that at bottom had been to his mind the main attraction of Marmion.

Doctor Prance did not reveal her private comment, whatever it was, on this intimation; she only said, after some hesitation,—“Well, I presume the old lady will take quite an interest in your being here.”

"I have no doubt she is capable even of that degree of philanthropy.”

"Well, she has charity for all, but she does—even she—prefer her own side. She regards you as quite an acquisition.”

Ransom could not but feel flattered at the idea that he had been a subject of conversation — as this implied — in the little circle at Miss Chancellor's; but he was at a loss, for the moment, to perceive what he had done up to this time to gratify the senior member of the group. "I hope she will find me an acquisition after I have been here a few days," he said, laughing.

"Well, she thinks you are one of the most important converts yet," Doctor Prance replied in a colorless way, as if she wouldn't have pretended to explain why.

"A convert — me? Do you mean of Miss Tarrant's?" It had come over him that Miss Birdseye, in fact, when he was parting with her after their meeting in Boston, had assented to his request for secrecy (which at first had struck her as somewhat unholy), on the ground that Verena would bring him into the fold. He wondered whether that young lady had been telling her old friend that she had succeeded with him. He thought this improbable; but it didn't matter, and he said, gayly, "Well, I can easily let her suppose so!"

It was evident that it would be no easier for Doctor Prance to subscribe to a deception than it had been for her venerable patient; but she went so far as to reply, "Well, I hope you won't let her suppose you are where you were that time I conversed with you. I could see where you were then!"

"It was in about the same place you were, wasn't it?"

"Well," said Doctor Prance, with a small sigh, "I am afraid I have moved back, if anything!" Her sigh told him a good deal; it seemed a dry, self-controlled protest against the tone of Miss Chancellor's interior, of which it was her present fortune to form a part: and the way she hovered round, indistinct in the gloom, as if she were rather loath to resume her place there, completed his impression that the little doctress had a line of her own.

"That, at least, must distress Miss Birdseye," he said, reproachfully.

"Not much, because I am not of importance. They think women the equals of men; but they are a great deal more pleased when a man joins than when a woman does."

Ransom complimented Doctor Prance on the lucidity of her mind, and then he said, "Is Miss Birdseye really sick? Is her condition very precarious?"

"Well, she is very old, and very — very gentle," Doctor Prance answered, hesitating a moment for her adjective. "Under those circumstances a person may flicker out."

"We must trim the lamp," said Ransom; "I will take my turn, with pleasure, in watching the sacred flame."

"It will be a pity if she doesn't live to hear Miss Tarrant's great effort," his companion went on.

"Miss Tarrant's? What's that?"

"Well, it's the principal interest, in there." And Doctor Prance now vaguely indicated, with a movement of her head, a small white house, much detached from its neighbors, which stood on their left, with its back to the water, at a little distance from the road. It exhibited more signs of animation than any of its fellows; several windows, notably those of the ground floor, were open to the warm evening, and a large shaft of light was projected upon the grassy wayside in front of it. Ransom, in his determination to be discreet, checked the advance of his companion, who added presently, with a short, suppressed laugh, — "You can see it is, from that!" He listened to ascertain what she meant, and after an instant a sound came to his ear — a sound he knew already well, which carried the accents of Verena Tarrant in ample periods and cadences out into the stillness of the August night.

"Murder, what a lovely voice!" he exclaimed, involuntarily.

Doctor Prance's eye gleamed towards him a moment, and she exclaimed, humorously (she was relaxing immensely), "Perhaps Miss Birdseye is right!" Then, as he made no rejoinder, only listening to the vocal inflections that floated out of the house, she went on — "She's practicing her speech."

"Her speech? Is she going to deliver one here?"

"No, as soon as they go back to town — at the Music Hall."

Ransom's attention was now transferred to his companion. "Is that why you call it her great effort?"

"Well, so they think it, I believe. She practices that way every night; she reads portions of it aloud to Miss Chancellor and Miss Birdseye."

"And that's the time you choose for your walk?" Ransom said, smiling.

"Well, it's the time my old lady has least need of me; she's too absorbed."

Doctor Prance dealt in facts; Ransom had already discovered that; and some of her facts were very interesting.

"The Music Hall — isn't that your great building?" he asked.

"Well, it's the biggest we've got; it's pretty big, but it isn't so big as Miss Chancellor's ideas," added Doctor Prance. "She has taken it to bring out Miss Tarrant before the general public — she has never appeared that way in Boston — on a great scale. She expects her to make a big sensation. It will be

a great night, and they are preparing for it. They consider it her real beginning."

"And this is the preparation?" Basil Ransom said.

"Yes; as I say, it's their principal interest."

Ransom listened, and while he listened he meditated. He had thought it possible Verena's principles might have been shaken by the profession of faith to which he treated her in New York; but this hardly looked like it. For some moments Doctor Prance and he stood together in silence.

"You don't hear the words," the doctor remarked, with a smile which, in the dark, looked Mephistophelian.

"Oh, I know the words!" the young man exclaimed, with rather a groan, as he offered her his hand for good-night.

XXXVI.

A CERTAIN prudence had determined him to put off his visit till the morning; he thought it more probable that at that time he should be able to see Verena alone; whereas, in the evening, the two young women would be sure to be sitting together. When the morrow dawned, however, Basil Ransom felt none of the trepidation of the procrastinator; he knew nothing of the reception that awaited him, but he took his way to the cottage designated to him overnight by Doctor Prance, with the step of a man much more conscious of his own purpose than of possible obstacles. He made the reflection, as he went, that to see a place for the first time at night is like reading a foreign author in a translation. At the present hour—it was getting towards eleven o'clock—he felt that he was dealing with an original. The little straggling, loosely clustered town lay along the edge of a blue inlet, on the other side of which was a low, wooded shore, with a gleam of white sand where it touched the water. The narrow bay carried the vision outward to a picture that seemed at once bright and dim—a shining, slumbering summer sea, and a far-off, circling line of coast, which, under the August sun, was hazy and delicate. Ransom regarded the place as a town because Doctor Prance had called it one; but it was a town where you smelt the breath of the hay in the streets, and you might gather blackberries in the principal square. The houses looked at each other across the grass—low, rusty, crooked, distended houses, with dry, cracked faces, and the dim eyes of small-paned, stiffly sliding windows. Their little door-yards bristled with rank, old-fashioned flowers, mostly yellow; and on the quarter that stood back from the sea the fields sloped upward, and the woods in which they

presently lost themselves looked down over the roofs. Bolts and bars were not a part of the domestic machinery of Marmion, and the responsive menial, receiving the visitor on the threshold, was a creature rather desired than definitely possessed; so that Basil Ransom found Miss Chancellor's house-door gaping wide (as he had seen it the night before), and destitute even of a knocker or a bell-handle. From where he stood in the porch he could see the whole of the little sitting-room on the left of the hall—see that it stretched straight through to the back windows; that it was garnished with photographs of foreign works of art, pinned upon the walls, and enriched with a piano and other little extemporized embellishments, such as ingenious women lavish upon the houses they hire for a few weeks. Verena told him afterwards that Olive had taken her cottage furnished, but that the paucity of chairs and tables and bedsteads was such that their little party used almost to sit down, to lie down, in turn. On the other hand they had all George Eliot's writings, and two photographs of the Sistine Madonna. Ransom rapped with his stick on the lintel of the door, but no one came to receive him; so he made his way into the parlor, where he observed that his cousin Olive had as many German books as ever lying about. He dipped into this literature, momentarily, according to his wont, and then remembered that this was not what he had come for, and that as he had waited at the door he had seen, through another door, opening at the opposite end of the hall, signs of a small veranda attached to the other face of the house. Thinking the ladies might be assembled there in the shade, he pushed aside the muslin curtain of the back window, and saw that the advantages of Miss Chancellor's summer residence were in this quarter. There was a veranda, in fact, to which a wide, horizontal trellis, covered with an ancient vine, formed a kind of extension. Beyond the trellis was a small, lonely garden; beyond the garden was a large, vague, woody space, where a few piles of old timber were disposed, and which he afterwards learned to be a relic of the ship-building era described to him by Doctor Prance; and still beyond this again was the charming, lake-like estuary he had already admired. His eyes did not rest upon the distance; they were attracted by a figure seated under the trellis, where the chequers of sun, in the interstices of the vine-leaves fell upon a bright-colored rug spread out on the ground. The floor of the roughly constructed veranda was so low that there was virtually no difference in the level. It took Ransom only a moment to recognize Miss Birdseye, though

her back was turned to the house. She was alone; she sat there motionless (she had a newspaper in her lap, but her attitude was not that of a reader), looking at the shimmering bay. She might be asleep; that was why Ransom moderated the process of his long legs as he came round through the house to join her. This precaution represented his only scruple. He stepped across the veranda and stood close to her, but she did not appear to notice him. Visibly, she was dozing, or presumably, rather, for her head was enveloped in an old faded straw hat, which concealed the upper part of her face. There were two or three other chairs near her, and a table on which were half a dozen books and periodicals, together with a glass containing a colorless liquid, on the top of which a spoon was laid. Ransom desired only to respect her repose, so he sat down in one of the chairs and waited till she should become aware of his presence. He thought Miss Chancellor's back garden a delightful spot, and his jaded senses tasted the breeze—the idle, wandering summer wind—that stirred the vine-leaves over his head. The hazy shores on the other side of the water, which had tints more delicate than the street vistas of New York (they seemed powdered with silver, a sort of mid-summer light), suggested to him a land of dreams, a country in a picture. Basil Ransom had seen very few pictures; there were none in Mississippi; but he had a vision at times of something that would be more refined than the real world, and the situation in which he now found himself pleased him almost as much as if it had been a striking work of art. He was unable to see, as I have said, whether Miss Birdseye were taking in the prospect through open or only, imagination aiding (she had plenty of that), through closed, tired, dazzled eyes. She appeared to him, as the minutes elapsed and he sat beside her, the incarnation of well-earned rest, of patient, submissive superannuation. At the end of her long day's work she might have been placed there to enjoy this dim prevision of the peaceful river, the gleaming shores, of the paradise her unselfish life had certainly qualified her to enter, and which, apparently, would soon be opened to her. After a while she said, placidly, without turning:

"I suppose it's about time I should take my remedy again. It does seem as if she had found the right thing; don't you think so?"

"Do you mean the contents of that tumbler? I shall be delighted to give it to you, and you must tell me how much you take." And Basil Ransom, getting up, possessed himself of the glass on the table.

At the sound of his voice Miss Birdseye

pushed back her straw hat by a movement that was familiar to her, and twisting about her muffled figure a little (even in August she felt the cold, and had to be much covered up to sit out), bent upon him a speculative unastonished gaze.

"One spoonful — two?" Ransom asked, stirring the dose and smiling.

"Well, I guess I'll take two this time."

"Certainly, Doctor Prance couldn't help finding the right thing," Ransom said, as he administered the medicine; while the movement with which she extended her face to take it made her seem doubly childlike.

He put down the glass, and she relapsed into her position; she seemed to be considering. "It's homeopathic," she remarked, in a moment.

"Oh, I have no doubt of that; I presume you wouldn't take anything else."

"Well, it's generally admitted now to be the true system."

Ransom moved closer to her, placed himself where she could see him better. "It's a great thing to have the true system," he said, bending towards her in a friendly way; "I'm sure you have it in everything." He was not often hypocritical; but when he was he went all lengths.

"Well, I don't know that any one has a right to say that. I thought you were Verena," she added in a moment, taking him in again with her mild, deliberate vision.

"I have been waiting for you to recognize me; of course you didn't know I was here — I only arrived last night."

"Well, I'm glad you have come to see Olive now."

"You remember that I wouldn't do that when I met you last?"

"You asked me not to mention to her that I had met you; that's what I principally recall."

"And don't you remember what I told you I wanted to do? I wanted to go out to Cambridge and see Miss Tarrant. Thanks to the information that you were so good as to give me, I was able to do so."

"Yes, she gave me quite a little description of your visit," said Miss Birdseye, with a smile, and a vague sound in her throat — a sort of pensive reference to the idea of laughter — of which Ransom never learned the exact significance, though he retained for a long time afterwards a kindly memory of the old lady's manner at the moment.

"I don't know how much she enjoyed it, but it was an immense pleasure to me; so great a one that, as you see, I have come to call upon her again."

"Then, I presume, she *has* shaken you?"

"She has shaken me tremendously!" said Ransom, laughing.

"Well, you'll be a great addition," Miss Birdseye returned. "And this time, your visit is also for Miss Chancellor?"

"That depends on whether she will receive me."

"Well, if she knows you are shaken, that will go a great way," said Miss Birdseye, a little musingly, as if even to her unsophisticated mind it had been manifested that one's relations with Miss Chancellor might be ticklish. "But she can't receive you now — can she? — because she's out. She has gone to the post-office for the Boston letters, and they get so many every day that she had to take Verena with her to help her carry them home. One of them wanted to stay with me, because Doctor Prance has gone fishing, but I said I presumed I could be left alone for about seven minutes. I know how they love to be together; it seems as if one *couldn't* go out without the other. That's what they came down here for, because it's quiet, and it didn't look as if there was any one else they would be much drawn to. So it would be a pity for me to come down after them just to spoil it!"

"I am afraid I shall spoil it, Miss Birdseye."

"Oh, well, a gentleman," murmured the ancient woman.

"Yes, what can you expect of a gentleman? I certainly shall spoil it if I can."

"You had better go fishing with Doctor Prance," said Miss Birdseye, with a serenity which showed that she was far from measuring the sinister quality of the announcement he had just made.

"I sha'n't object to that at all. The days here must be very long — very full of hours. Have you got the doctor with you?" Ransom inquired, as if he knew nothing at all about her.

"Yes, Miss Chancellor invited us both; she is very thoughtful. She is not merely a theoretic philanthropist — she goes into details," said Miss Birdseye, presenting her large person, in her chair, as if she herself were only an item. "It seems as if we were not so much wanted in Boston, just in August."

"And here you sit and enjoy the breeze, and admire the view," the young man remarked, wondering when the two messengers, whose seven minutes must long since have expired, would return from the post-office.

"Yes, I enjoy everything in this little Old-World place; I didn't suppose I should be satisfied to be so passive. It's a great contrast to my former exertions. But somehow it doesn't seem as if there were any trouble or any wrong round here; and if there should

be, there are Miss Chancellor and Miss Tarrant to look after it. They seem to think I had better fold my hands. Besides, when helpful, generous minds begin to flock in from *your* part of the country," Miss Birdseye continued, looking at him from under the distorted and discolored canopy of her hat with a benignity which completed the idea in any cheerful sense he chose.

He felt by this time that he was committed to rather a dishonest part; he was pledged not to give a shock to her optimism. This might cost him, in the coming days, a good deal of dissimulation, but he was now saved from any further expenditure of ingenuity by certain warnings which admonished him that he must keep his wits about him for a purpose more urgent. There were voices in the hall of the house, voices he knew, which came nearer, quickly; so that before he had time to rise one of the speakers had come out with the exclamation — "Dear Miss Birdseye, here are seven letters for you!" The words fell to the ground, indeed, before they were fairly spoken, and when Ransom got up, turning, he saw Olive Chancellor standing there, with the parcel from the post-office in her hand. She stared at him in sudden horror; for the moment her self-possession completely deserted her. There was so little of any greeting in her face save the greeting of dismay, that he felt there was nothing for him to say to her, nothing that could mitigate the odious fact of his being there. He could only let her take it in, let her divine that, this time, he was not to be got rid of. In an instant — to ease off the situation — he held out his hand for Miss Birdseye's letters, and it was a proof of Olive's having turned rather faint and weak that she gave them up to him. He delivered the packet to the old lady, and now Verena had appeared in the doorway of the house. As soon as she saw him, she blushed crimson; but she didn't, like Olive, stand voiceless.

"Why, Mr. Ransom," she cried out, "Where in the world were *you* washed ashore?" Miss Birdseye, meanwhile taking her letters, had no appearance of observing that the encounter between Olive and her visitor was a kind of concussion.

It was Verena who eased off the situation. She had colored violently, as I say, as soon as her eyes rested on Ransom; but her gay challenge rose to her lips as promptly as if she had had no cause for embarrassment. She was not confused even when she blushed, and her alertness may perhaps be explained by the habit of public speaking. Ransom smiled at her while she came forward, but he spoke first to Olive, who had already turned her eyes away from him, and gazed at the blue

sea-view as if she were wondering what was going to happen to her at last.

"Of course you are very much surprised to see me; but I hope to be able to induce you to regard me not absolutely in the light of an intruder. I found your door open, and I walked in, and Miss Birdseye seemed to think I might stay. Miss Birdseye, I put myself under your protection; I invoke you; I appeal to you," the young man went on. "Adopt me, answer for me, cover me with the mantle of your charity!"

Miss Birdseye looked up from her letters, as if at first she had only faintly heard his appeal. She turned her eyes from Olive to Verena; then she said, "Doesn't it seem as if we had room for all? When I remember what I have seen in the South, Mr. Ransom's being here strikes me as a great triumph."

Olive evidently didn't understand, and Verena broke in with eagerness, "It was by my letter, of course, that you knew we were here. The one I wrote just before we came, Olive," she went on. "Don't you remember I showed it to you?"

At the mention of this act of submission on her friend's part Olive started, flashing her a strange look; then she said to Basil that she didn't see why he should explain so much about his coming; every one had a right to come. It was a very charming place; it ought to do any one good. "But it will have one defect for you," she added; "three-quarters of the summer-residents are women!"

This attempted pleasantry on Miss Chancellor's part, so unexpected, so incongruous, uttered with white lips and cold eyes, struck Ransom to that degree by its oddity that he could not resist exchanging a glance of wonder with Verena, who, if she had had the opportunity, could probably have explained to him the phenomenon. Olive had recovered herself, reminded herself that she was safe, that her companion in New York had repudiated, denounced her pursuer; and, as a proof to her own sense of her security, as well as a touching mark to Verena that now, after what had passed, she had no fear, she felt that a certain light mockery would be effective.

"Ah, Miss Olive, don't pretend to think I love your sex so little, when you know that

what you really object to in me is that I love it too much!" Ransom was not brazen; he was not impudent; he was really a very modest man. But he was aware that whatever he said or did he was condemned to seem impudent now, and he argued within himself that if he was to have the dishonor of being thought brazen he might as well have the comfort. He didn't care a straw, in truth, how he was judged or how he might offend; he had a purpose which swallowed up such inanities as that, and he was so full of it that it kept him firm, balanced him, gave him an assurance that might easily have been confounded with ironical coolness. "This place will do me good," he pursued; "I haven't had a holiday for more than two years, I couldn't have gone another day; I was finished. I would have written to you beforehand that I was coming, but I only started at a few hours' notice. It occurred to me that this would be just what I wanted; I remembered what Miss Tarrant had said in her note, that it was a place where people could lie on the ground and wear their old clothes. I delight to lie on the ground, and all my clothes are old. I hope to be able to stay three or four weeks."

Olive listened till he had done speaking; she stood a single moment longer, and then, without a word, a glance, she went into the house. Ransom saw that Miss Birdseye was immersed in her letters; so he went straight to Verena and stood before her, looking far into her eyes. He was not smiling now, as he had been in speaking to Olive. "Will you come somewhere apart, where I can speak to you alone?"

"Why have you done this? It was not right in you to come!" Verena looked still as if she were blushing, but Ransom perceived he must allow for her having been delicately scorched by the sun.

"I have come because it is necessary,—because I have something very important to say to you. A great number of things."

"The same things you said in New York? I don't want to hear them again,—they were horrible!"

"No, not the same—different ones. I want you to come out with me, away from here."

Henry James.

(To be continued.)

A STORY OF SEVEN DEVILS.

THE negro church which stood in the pine woods near the little village of Oxford Cross Roads, in one of the lower counties of Virginia, was presided over by an elderly individual, known to the community in general as Uncle Pete; but on Sundays the members of his congregation addressed him as Brudder Peter. He was an earnest and energetic man, and, although he could neither read nor write, he had for many years expounded the Scriptures to the satisfaction of his hearers. His memory was good, and those portions of the Bible which from time to time he had heard read were used by him, and frequently with powerful effect, in his sermons. His interpretations of the Scriptures were generally entirely original, and were made to suit the needs, or what he supposed to be the needs, of his congregation.

Whether as "Uncle Pete" in the garden and corn-field or "Brudder Peter" in the church, he enjoyed the good opinion of everybody excepting one person, and that was his wife. She was a high-tempered and somewhat dissatisfied person, who had conceived the idea that her husband was in the habit of giving too much time to the church, and too little to the acquisition of corn-bread and pork. On a certain Saturday she gave him a most tremendous scolding, which so affected the spirits of the good man that it influenced his decision in regard to the selection of the subject for his sermon the next day.

His congregation was accustomed to being astonished, and rather liked it, but never before had their minds received such a shock as when the preacher announced the subject of his discourse. He did not take any particular text, for this was not his custom, but he boldly stated that the Bible declared that every woman in this world was possessed by seven devils; and the evils which this state of things had brought upon the world he showed forth with much warmth and feeling. Subject-matter, principally from his own experience, crowded in upon his mind, and he served it out to his audience hot and strong. If his deductions could have been proved to be correct, all women were creatures who, by reason of their seven-fold diabolic possession, were not capable of independent thought or action, and who should in tears and humility place themselves absolutely under the direction and authority of the other sex.

When he approached the conclusion of his

sermon, Brother Peter closed with a bang the Bible, which, although he could not read a word of it, always lay open before him while he preached, and delivered the concluding exhortation of his sermon:

"Now, my dear brev'ren ob dis congregation," he said, "I want you to understan' dat dar's nuffin in dis yer sarmon wot you've jus' heerd ter make you think yousefs angels. By no means, brev'ren; you was all brung up by wimmen, an' you've got ter lib wid 'em, an' ef anythin' in dis yer worl' is ketchin', my dear brev'ren, it's habin debbils, an' from wot I've seen ob some ob de men ob dis worl' I 'spect dey is persect ob 'bout all de debbils dey got room fur. But de Bible don' say nuffin p'intedly on de subjec' ob de number ob debbils in man, an' I 'spec' dose dat's got 'em—an' we ought ter feel pow'ful thankful, my dear brev'ren, dat de Bible don' say we all's got 'em—has 'em 'cordin to sarcumstances. But wid de wimmin it's dif'rent; dey's got jus' sebin, an' bless my soul, brev'ren, I think dat's 'nuff.

"While I was a-turnin' ober in my min' de subjec' ob dis sarmon, dere come ter me a bit ob Scripter wot I heerd at a big preachin' an' baptizin' at Kyarter's Mills, 'bout ten year' ago. One ob de preachers was a-tellin' about ole mudder Ebea-eatin' de apple, and says he: De sarpint fus' come along wid a red apple, an', says he: You gib dis yer to your husban', an' he think it so mighty good dat when he done eat it he gib you anything you ax him fur, ef you tell him whar de tree is. Ebe, she took one bite, an' den she frew dat apple away. Wot you mean, you triflin' sarpint, says she, a fotchin' me dat apple wot ain't good fur nuffin but ter make cider wid. Den de sarpint he go fotch her a yaller apple, an' she took one bite an' den says she: Go 'long wid ye, you fool sarpint, wot you fotch me dat June apple wot ain't got no taste to it? Den de sarpint he think she like sumpin' sharp, an' he fotch her a green apple. She takes one bite ob it, an' den she frows it at his head, an' sings out: Is you 'spectin me to gib dat apple to yer Uncle Adam an' gib him de colic? Den de debbil he fotch her a lady-apple, but she say she won't take no sich triflin' nubbins as dat to her husban', an' she took one bite ob it, an' frew it away. Den he go fotch her two udder kin' ob apples, one yaller wid red stripes, an' de udder one red on one side an' green on de udder,—mighty good lookin'

apples, too—de kin' you git two dollars a bar'l fur at the store. But Ebe, she wouldn't hab neider ob 'em, an' when she done took one bite out ob each one, she frew it away. Den de ole debbil-sarpint, he scratch he head, an' he say to hese'f: Dis yer Ebe, she pow'ful ticklar 'bout her apples. Reckin I'll have ter wait till after fros', an' fotch her a real good one. An' he done wait till after fros', and den he fotch her a Albemarle pippin, an' when she took one bite ob dat, she jus' go 'long an' eat it all up, core, seeds, and all. Look h'yar, sarpint, says she, hab you got anudder ob dem apples in your pocket? An' den he tuk one out, an' gib it to her. "'Cuse me,' says she, 'I's gwine ter look up Adam, an' ef he don' want ter know war de tree is wot dese apples grow on, you kin hab him fur a cawn-fel' han'.'

"An' now, my dear brev'ren," said Brother Peter, "while I was a-turmin' dis subjec' ober in my min', an' wonderin' how de wimmin come ter hab jus' seben debbils apiece, I done reckerleck dat bit ob Scriptor wot I heerd at Kyarter's Mills, an' I reckon dat 'splains how de debbils got inter woman. De sarpint he done fotch mudder Ebe seben apples, an' ebery one she take a bite out of gib her a debbil."

As might have been expected, this sermon produced a great sensation, and made a deep impression on the congregation. As a rule the men were tolerably well satisfied with it; and when the services were over many of them made it the occasion of shy but very plainly pointed remarks to their female friends and relatives.

But the women did not like it at all. Some of them became angry, and talked very forcibly, and feelings of indignation soon spread among all the sisters of the church. If their minister had seen fit to stay at home and preach a sermon like this to his own wife (who, it may be remarked, was not present on this occasion), it would have been well enough, provided he had made no allusions to outsiders; but to come there and preach such things to them was entirely too much for their endurance. Each one of the women knew she had not seven devils, and only a few of them would admit of the possibility of any of the others being possessed by quite so many.

Their preacher's explanation of the manner in which every woman came to be possessed of just so many devils appeared to them of little importance. What they objected to was the fundamental doctrine of his sermon, which was based on his assertion that the Bible declared every woman had seven devils. They were not willing to believe that the Bible said

any such thing. Some of them went so far as to state it was their opinion that Uncle Pete had got this fool notion from some of the lawyers at the court-house when he was on a jury a month or so before. It was quite noticeable that, although Sunday afternoon had scarcely begun, the majority of the women of the congregation called their minister Uncle Pete. This was very strong evidence of a sudden decline in his popularity.

Some of the more vigorous-minded women, not seeing their minister among the other people in the clearing in front of the log church, went to look for him, but he was not to be found. His wife had ordered him to be home early, and soon after the congregation had been dismissed he departed by a short cut through the woods. That afternoon an irate committee, composed principally of women, but including also a few men who had expressed disbelief in the new doctrine, arrived at the cabin of their preacher, but found there only his wife, cross-grained old Aunt Rebecca. She informed them that her husband was not at home.

"He's done 'gaged hisse'f," she said, "ter cut an' haul wood fur Kunnal Martin ober on Little Mount'n fur de whole ob nex' week. It's fourteen or thirteen mile' from h'yar, an' ef he'd started ter-morrer mawnin', he'd los' a'mos' a whole day. 'Sides dat, I done tole him dat ef he git dar ter-night he'd have his supper frowed in. Wot you all want wid him? Gwine ter pay him fur preachin'?"

Any such intention as this was instantaneously denied, and Aunt Rebecca was informed of the subject upon which her visitors had come to have a very plain talk with her husband.

Strange to say, the announcement of the new and startling dogma had apparently no disturbing effect upon Aunt Rebecca. On the contrary, the old woman seemed rather to enjoy the news.

"Reckin he oughter know all 'bout dat," she said. "He's done had free wives, an' he ain't got rid o' dis one yit."

Judging from her chuckles and waggings of the head when she made this remark, it might be imagined that Aunt Rebecca was rather proud of the fact that her husband thought her capable of exhibiting a different kind of diabolism every day in the week.

The leader of the indignant church members was Susan Henry, a mulatto woman of a very independent turn of mind. She prided herself that she never worked in anybody's house but her own, and this immunity from outside service gave her a certain preëminence among her sisters. Not only did Susan share the general resentment with which the startling statement of old Peter had been received,

but she felt that its promulgation had affected her position in the community. If every woman was possessed by seven devils, then, in this respect, she was no better nor worse than any of the others; and at this her proud heart rebelled. If the preacher had said some women had eight devils and others six, it would have been better. She might then have made a mental arrangement in regard to her relative position, which would have somewhat consoled her. But now there was no chance for that. The words of the preacher had equally debased all women.

A meeting of the disaffected church members was held the next night at Susan Henry's cabin, or rather in the little yard about it, for the house was not large enough to hold the people who attended it. The meeting was not regularly organized, but everybody said what he or she had to say, and the result was a great deal of clamor, and a general increase of indignation against Uncle Pete.

"Look h'yar!" cried Susan, at the end of some energetic remarks, "is dar enny pusson h'yar who kin count up figgers?"

Inquiries on the subject ran through the crowd, and in a few moments a black boy, about fourteen, was pushed forward as an expert in arithmetic.

"Now, you Jim," said Susan, "you's been to school, an' you kin count up figgers. 'Cordin' ter de chu'ch books dars forty-seben women b'longin' to our meetin', an' ef each one ob dem dar has got seben debbils in her, I jus' wants you ter tell me how many debbils come to chu'ch ebery cl'ar Sunday ter hear dat ole Uncle Pete preach."

This view of the case created a sensation, and much interest was shown in the result of Jim's calculations, which were made by the aid of a back of an old letter and a piece of pencil furnished by Susan. The result was at last announced as three hundred and nineteen, which, although not precisely correct, was near enough to satisfy the company.

"Now, you jus' turn dat ober in you all's minds," said Susan. "More'n free hunderd debbils in chu'ch ebery Sunday, an' we women fetchin' 'em. Does anybody s'pose Ise gwine ter b'lieve dat fool talk?"

A middle-aged man now lifted up his voice and said: "Ise been thinkin' ober dis h'yar matter, and Ise 'cluded dat p'r'aps de words ob de preacher was used in a figgeratous form o' sense. P'r'aps de seben debbils meant chillun."

These remarks were received with no favor by the assemblage.

"Oh, you git out!" cried Susan. "Your ole woman's got seben chillun, shore 'nuf, an' I s'pec' dey's all debbils. But dem sent'ments don' apply ter all de udder women h'yar, 'tic-

larly ter dem dar young uns wot ain't married yit."

This was good logic, but the feeling on the subject proved to be even stronger, for the mothers in the company became so angry at their children being considered devils that for a time there seemed to be danger of an Amazonian attack on the unfortunate speaker. This was averted, but a great deal of uproar now ensued, and it was the general feeling that something ought to be done to show the deep-seated resentment with which the horrible charge against the mothers and sisters of the congregation had been met. Many violent propositions were made, some of the younger men going so far as to offer to burn down the church. It was finally agreed, quite unanimously, that old Peter should be unceremoniously ousted from his place in the pulpit which he had filled so many years.

As the week passed on, some of the older men of the congregation who had friendly feelings towards their old companion and preacher talked the matter over among themselves, and afterwards, with many of their fellow-members, succeeded at last in gaining the general consent that Uncle Pete should be allowed a chance to explain himself, and give his grounds and reasons for his astounding statement in regard to womankind. If he could show biblical authority for this, of course nothing more could be said. But if he could not, then he must get down from the pulpit, and sit for the rest of his life on a back seat of the church. This proposition met with the more favor, because even those who were most indignant had an earnest curiosity to know what the old man would say for himself.

During all this time of angry discussion, good old Peter was quietly and calmly cutting and hauling wood on the Little Mountain. His mind was in a condition of great comfort and peace, for not only had he been able to rid himself, in his last sermon, of many of the hard thoughts concerning women that had been gathering themselves together for years, but his absence from home had given him a holiday from the harassments of Aunt Rebecca's tongue, so that no new notions of woman's culpability had risen within him. He had dismissed the subject altogether, and had been thinking over a sermon regarding baptism, which he thought he could make convincing to certain of the younger members of his congregation.

He arrived at home very late on Saturday night, and retired to his simple couch without knowing anything of the terrible storm which had been gathering through the week, and which was to burst upon him on the morrow. But the next morning, long before church time, he received warning enough of

what was going to happen. Individuals and deputations gathered in and about his cabin,—some to tell him all that had been said and done; some to inform him what was expected of him; some to stand about and look at him; some to scold; some to denounce; but, alas! not one to encourage; nor one to call him “Brudder Peter,” that Sunday appellation dear to his ears. But the old man possessed a stubborn soul, not easily to be frightened.

“Wot I says in de pulpit,” he remarked, “I’ll ’splain in de pulpit, an’ you all ud better git ’long to de chu’ch, an’ when de time fur de sarvice come, I’ll be dar.”

This advice was not promptly acted upon, but in the course of half an hour nearly all the villagers and loungers had gone off to the church in the woods; and when Uncle Peter had put on his high black hat, somewhat battered, but still sufficiently clerical-looking for that congregation, and had given something of a polish to his cowhide shoes, he betook himself by the accustomed path to the log building where he had so often held forth to his people. As soon as he entered the church he was formally instructed by a committee of the leading members that before he began to open the services, he must make it plain to the congregation that what he had said on the preceding Sunday about every woman being possessed by seven devils was Scripture truth, and not mere wicked nonsense out of his own brain. If he could not do that, they wanted no more praying or preaching from him.

Uncle Peter made no answer, but ascending the little pulpit, he put his hat on the bench behind him where it was used to repose, took out his red cotton handkerchief and blew his nose in his accustomed way, and looked about him. The house was crowded. Even Aunt Rebecca was there.

After a deliberate survey of his audience the preacher spoke: “Brev’eren an’ sisters, I see afore me Brudder Bill Hines, who kin read de Bible, an’ has got one. Ain’t dat so, Brudder?”

Bill Hines having nodded and modestly grunted assent, the preacher continued. “An’ dar’s Aun’ Priscilla’s boy, Jake, who ain’t a brudder yit, though he’s plenty old ’nuf, min’, I tell ye; an’ he kin read de Bible, fus’ rate, an’ has read it ter me ober an’ ober ag’in. Ain’t dat so, Jake?”

Jake grinned, nodded, and hung his head, very uncomfortable at being thus publicly pointed out.

“An’ dar’s good ole Aun’ Patty, who knows more Scripter’ dan ennybuddy h’yar, havin’ been taught by de little gals from Kunnell Jasper’s, an’ by dere mudders afore ’em. I reckon she know’ de hull Bible straight frow, from de Garden of Eden to de New Jerus’lum. An’ dar are udders h’yar who knows de Scripters, some one part an’ some anudder. Now I axes ebery one ob you all wot know de Scripters ef he don’ ’member how de Bible tells how our Lor’ when he was on dis yearth cas’ seven debbils out o’ Mary Magdalum?”

A murmur of assent came from the congregation. Most of them remembered that.

“But did enny ob you ebber read, or hab read to you, dat he ebber cas’ ’em out o’ enny udder woman?”

Negative grunts and shakes of the head signified that nobody had ever heard of this.

“Well, den,” said the preacher, gazing blandly around, “all de udder women got ’em yit.”

A deep silence fell upon the assembly, and in a few moments an elderly member arose. “Brudder Peter,” he said, “I reckon you mought as well gib out de hymed.”

Frank R. Stockton.

SONGS OF BATTLE.*

OLD as the world—no other things so old;
 Nay, older than the world, else, how had sprung
 Such lusty strength in them when earth was young?—
 Stand valor and its passion hot and bold,
 Insatiate of battle. How, else, told
 Blind men, born blind, that red was fitting tongue
 Mute, eloquent, to show how trumpets rung
 When armies charged and battle-flags unrolled?
 Who sings of valor speaks for life, for death,
 Beyond all death, and long as life is life,
 In rippled waves the eternal air his breath
 Eternal bears to stir all noble strife.
 Dead Homer from his lost and vanished grave
 Keeps battle glorious still and soldiers brave.

Helen Jackson. (H. H.)

THE MYSTERY OF WILHELM RÜTTER.

IT was long past dusk of an August evening. Farmer Weitbreck stood leaning on the big gate of his barn-yard, looking first up and then down the road. He was chewing a straw, and his face wore an expression of deep perplexity. These were troublous times in Lancaster County. Never before had the farmers been so put to it for farm service; harvest-time had come, and instead of the stream of laborers seeking employment, which usually at this season set in as regularly as river freshets in spring, it was this year almost impossible to hire any one.

The explanation of this nobody knew or could divine; but the fact was indisputable, and the farmers were in dismay,—nobody more so than Farmer Weitbreck, who had miles of bottom-lands, in grain of one sort and another, all yellow and nodding, and ready for the sickle, and nobody but himself and his son John to swing scythe, sickle, or flail on the place.

"Never I am caught this way anoder year," thought he, as he gazed wearily up and down the dark, silent road; "but that does to me no goot this time that is now."

Gustavus Weitbreck had lived so long on his Pennsylvania farm that he even thought in English instead of in German, and, strangely enough, in English much less broken and idiomatic than that which he spoke. But his phraseology was the only thing about him that had changed. In modes of feeling, habits of life, he was the same he had been forty years ago, when he farmed a little plot of land, half wheat, half vineyard, in the Mayence meadows in the fatherland: slow, methodical, saving, stupid, upright, obstinate. All these traits "Old Weitbreck," as he was called all through the country, possessed to a degree much out of the ordinary; and it was a combination of two of them—the obstinacy and the savingness—which had brought him into his present predicament.

In June he had had a good laborer: one of the best, known and eagerly sought by every farmer in the county; a man who had never yet been beaten in a mowing match or a reaping. By his help the haying had been done in not much more than two-thirds the usual time; but when John Weitbreck, like a sensible fellow, said, "Now, we would better keep Alf on till harvest. There is plenty of odds-and-ends work about the farm he can help at, and we won't get his like again in a hurry," his father had cried out:

"Mein Gott! It is that you tink I must be made out of money! I vill not keep dis man on so big wages to do vat you call odd-and-end vork. We do odd-and-end work ourself."

There was no discussion of the point. John Weitbreck knew better than ever to waste his time and breath or temper in trying to change a purpose of his father's, or convince him of a mistake. But he bided his time, and he would not have been human if he had not now taken secret satisfaction, seeing his father's anxiety daily increase as the August sun grew hotter and hotter, and the grain rattled in the husks waiting to be reaped, while they two, straining their arms to the utmost, and in long days' work, seemed to produce small impression on the great fields.

"The women shall come work in field to-morrow," thought the old man, as he continued his anxious reverie. "It is not that they sit idle all day in house, when the wheat grows to rattle like the peas in pod. They can help, the mütter and Carlen; that will be much help; they can do." And hearing John's steps behind him, the old man turned and said:

"Johan, dere comes yet no man to reap; to-morrow must go in the field Carlen and the mütter; it must; the wheat get fast too dry; it is more as two men can do."

John bit his lips. He was aghast. Never had he seen his mother and sister at work in the fields. John had been born in America, and he was American, not German, in his feeling about this. Without due consideration he answered:

"I would rather work day and night, father, than see my mother and sister in the fields. I will do it, too, if only you will not make them go!"

The old man, irritated by the secret knowledge that he had nobody but himself to blame for the present dilemma, still more irritated, also, by this proof of what was always exceedingly displeasing to him, his son's having adopted American standards and opinions, broke out furiously with a wrath wholly disproportionate to the occasion.

"You be tam, Johan Weitbreck. You tink we are fine gentlemen and ladies, like dese Americans dat is too proud to vork vid hands. I say tam dis country, vere day say all is alike, an' vork all; and ven you come here, it is dat nobody vill vork, if he can help, and vimmins ish shame to be seen vork. It is not shame to be seen vork; I vork, mein vife vork too, an' my childrens vork, too, py tam!"

John walked away, his only resource when his father was in a passion. John occupied that hardest of all positions,—the position of a full-grown, mature man in a father's home, where he is regarded as nothing more than a boy.

As he entered the kitchen and saw his pretty sister Carlen at the high spinning-wheel, walking back and forth drawing the fine yarn between her chubby fingers, all the while humming a low song to which the whirring of the wheel made harmonious accompaniment, he thought to himself bitterly: "Work, indeed! As if they did not work now longer than we do, and quite as hard! She's been spinning ever since daylight, I believe."

"Is it hard work spinning, Liebchen?" he asked.

Carlen turned her round blue eyes on him with astonishment. There was something in his tone that smote vaguely on her consciousness. What could he mean, asking such a question as that?

"No," she said, "it is not hard exactly. But when you do it very long it does make the arms ache, holding them so long in the same position; and it tires one to stand all day!"

"Ay," said John, "that is the way it tires one to reap; my back is near broke with it to-day."

"Has no one come to help yet?" she said.

"No!" said John angrily, "and that is what I told father when he let Alf go. It is good enough for him for being so stingy and short-sighted; but the brunt of it comes on me; that's the worst of it. I don't see what's got all the men. There have always been plenty round every year till now."

"Alf said he shouldn't be here next year," said Carlen, each cheek showing a little signal of pink as she spoke; but it was a dim light the one candle gave, and John did not see the flush; "he was going to the west to farm; in Oregon, he said."

"Ay, that's it!" replied John. "That's where everybody can go but me! I'll be going too some day, Carlen. I can't stand things here. If it weren't for you I'd have been gone long ago."

"I wouldn't leave mother and father for all the world, John," cried Carlen warmly, "and I don't think it would be right for you to! What would father do with the farm without you?"

"Well, why doesn't he see that, then, and treat me as a man ought to be treated?" exclaimed John; "he thinks I'm no older than when he used to beat me with the strap."

"I think fathers and mothers are always that way," said the gentle, cheery Carlen, with a low laugh. "The mother tells me each

time how to wind the warp, as she did when I was little; and she will always look into the churn for herself. I think it is the way we are made. We will do the same when we are old, John, and our children will be wondering at us!"

John laughed. This was always the way with Carlen. She could put a man in good humor in a few minutes, however cross he felt in the beginning.

"I won't, then!" he exclaimed. "I know I won't. If ever I have a son grown, I'll treat him like a son grown, not like a baby."

"May I be there to see," said Carlen merrily,

"And you remember free
The words I said to thee.

Hold the candle here for me, will you, that's a good boy. While we have talked, my yarn has tangled."

As they stood close together, John holding the candle high over Carlen's head, she bending over the tangled yarn, the kitchen door opened suddenly and their father came in, bringing with him a stranger,—a young man seemingly about twenty-five years of age, tall, well made, handsome, but with a face so melancholy that both John and Carlen felt a shiver as they looked upon it.

"Here now comes de hand, at last of de time, Johan," cried the old man. "It vill be that all can vell be done now. And it is goot that he is from mine own country. He cannot English-speak, many vords; but dat is nothing; he can vork. I tolt you dere vould be mans come!"

John looked scrutinizingly at the new-comer. The man's eyes fell.

"What is your name?" said John.

"Wilhelm Rütter," he answered.

"How long have you been in this country?"

"Ten days."

"Where are your friends?"

"I haf none."

"None?"

"None."

These replies were given in a tone as melancholy as the expression of the face.

Carlen stood still, her wheel arrested, the yarn between her thumb and finger, her eyes fastened on the stranger's face. A thrill of unspeakable pity stirred her. So young, so sad, thus alone in the world; who ever heard of such a fate?

"But there were people who came with you in the ship?" said John. "There is some one who knows who you are, I suppose."

"No, no von dat knows," replied the new-comer.

"Haf done vid too much questions," interrupted Farmer Weitbreck. "I haf him asked all. He stays till harvest be done. He can vork. It is to be easy see he can vork."

John did not like the appearance of things. "Too much mystery here," he thought. "However, it is not long he will be here; and he will be in the fields all the time; there cannot be much danger; but who ever heard of a man whom no human being knew?"

As they sat at supper, Farmer Weitbreck and his wife plied Wilhelm with questions about their old friends in Mayence. He was evidently familiar with all the localities and names which they mentioned. His replies, however, were given as far as possible in monosyllables, and he spoke no word voluntarily. Sitting with his head bent slightly forward, his eyes fixed on the floor, he had the expression of one lost in thoughts of the gloomiest kind.

"Make yourself to be more happy, mein lad," said the farmer, as he bade him good-night and clapped him on the shoulder. "You haf cum to house vere is German be speaked, and is Germany in hearts; dat vill be to you as friends."

A strange look of even keener pain passed over the young man's face, and he left the room hastily, without a word of good-night.

"He's a surly brute!" cried John; "nice company he'll be in the field! I believe I'd sooner have nobody!"

"I think he has seen some dreadful trouble," said Carlen; "I wish we could do something for him; perhaps his friends are all dead. I think that must be it; don't you think so, mütter?"

Frau Weitbreck was incarnate silence and reticence. These traits were native in her, and had been intensified to an abnormal extent by thirty years of life with a husband whose temper and peculiarities were such as to make silence and reticence the sole conditions of peace and comfort. To so great a degree had this second nature of the good frau's been developed, that she herself did not now know that it was a second nature; therefore it stood her in hand as well as if she had been originally born to it, and it would have been hard to find in Lancaster County a more placid and contented wife than she. She never dreamed that her custom of silent acquiescence in all that Gustavus said, of waiting in all cases, small and great, for his decision had in the outset been born of radical and uncomfortable disagreements with him. And as for Gustavus himself, if anybody had hinted to him that his frau could think, or ever had thought, any word or deed of his other than right, he would have chuckled complacently at that person's blind ignorance of the truth.

"Mein frau, she is goot," he said; "goot frau, goot mütter — American fraus not goot so she; all the time talk and no vork; American fraus, American mans, are sheep in dere house."

But in regard to this young stranger, Frau Weitbreck seemed strangely stirred from her usual phlegmatic silence. Carlen's appeal to her had barely been spoken, when, rising in her place at the head of the table, the old woman said, solemnly, in German:

"Yes, Liebchen, he goes with the eyes like eyes of a man that saw always the dead. It must be as you say that all whom he loves are in the grave. Poor boy! Poor boy. It is now that one must be to him mother and father and brother."

"And sister too," said Carlen, warmly. "I will be his sister."

"And I not his brother, till he gets a civiler tongue in his head," said John.

"It is not to be brother I haf him brought," interrupted the old man. "Always you wimmen are too soon; it may be he are goot, it may be he are pad; I do not know. It is to vork I haf him brought."

"Yes," echoed Frau Weitbreck, "we do not know."

It was not so easy as Carlen and her mother had thought, to be like mother and sister to Wilhelm. The days went by, and still he was as much a stranger as on the evening of his arrival. He never voluntarily addressed any one. To all remarks or even questions he replied in the fewest words and curtest phrases possible. A smile was never seen on his face. He sat at the table like a mute at a funeral, ate without lifting his eyes, and silently rose as soon as his own meal was finished. He had soon selected his favorite seat in the kitchen. It was on the right-hand side of the big fireplace, in a corner. Here he sat all through the evenings, carving out of cows' horns or wood, boxes and small figures such as are made by the peasants in the German Tyrol. In this work he had a surprising skill. What he did with the carvings when finished no one knew. One night John said to him:

"I do not see, Wilhelm, how you can have so steady a hand after holding the sickle all day. My arm aches, and my hand trembles so that I can but just carry my cup to my lips."

Wilhelm made no reply, but held his right hand straight out at arm's length, with the delicate figure he was carving poised on his forefinger. It stood as steady as on the firm ground.

Carlen looked at him admiringly. "It is good to be so steady-handed," she said. "You must be strong, Wilhelm." "Yes," he said, "I haf strong," and went on carving.

Nothing more like conversation than this was ever drawn from him. Yet he seemed not averse to seeing people. He never left the kitchen till the time came for bed; but when that came he slipped away silent, taking no part in the general good-night, unless he was forced to do so. Sometimes Carlen, having said jokingly to John, "Now, I will make Wilhelm say good-night, to-night," succeeded in surprising him before he could leave the room; but often, even when she had thus planned, he contrived to evade her, and was gone before she knew it.

He slept in a small chamber in the barn, a dreary enough little place, but he seemed to find it all sufficient. He had no possessions except the leather pack he had brought on his back. This lay on the floor unlocked; and when the good Frau Weitbreck, persuading herself that she was actuated solely by a righteous motherly interest in the young man, opened it, she found nothing whatever there, except a few garments of the commonest description; no book, no paper, no name on any article. It would not appear possible that a man of so decent a seeming as Wilhelm could have come from Germany to America with so few personal belongings. Frau Weitbreck felt less at ease in her mind about him after she examined this pack.

He had come straight from the ship to their house, he had said, when he arrived; had walked on day after day, going he knew not whither, asking mile by mile for work. He did not even know one state's name from another. He simply chose to go south rather than north, always south he said.

"Why?"

He did not know.

He was indeed strong. The sickle was in his hand a plaything, so swift-swung that he seemed to be doing little more than simply striding up and down the field, the grain falling to right and left at his steps. From sunrise to sunset he worked tirelessly. The famous Alf had never done so much in a day. Farmer Weitbreck chuckled as he looked on.

"Vat now you say of dat Alf?" he said triumphantly to John. "Vork he as dis man? Oh, but he make swing de hook!"

John assented unqualifiedly to this praise of Wilhelm's strength and skill. But nevertheless he shook his head.

"Ay, ay," he said, "I never saw his equal. But I like him not. What carries he in his heart to be so sour. He is like a man bewitched; I know not if there be such a thing as to be sold to the devil, as the stories say, but if there be, on my word I think Wilhelm has made some such bargain. A man could not look worse if he had signed himself away."

"I see not that he haf fear in his face," replied the old man.

"No," said John, "neither do I see fear. It is worse than fear. I would like to see his face come alive with a fear. He gives me cold shivers like a grave under foot. I shall be glad when he is gone."

Farmer Weitbreck laughed. He and his son were likely to be again at odds on the subject of a laborer.

"But he vill not go. I haf said to him to stay till Christmas, may be always."

John's surprise was unbounded.

"To stay! Till Christmas!" he cried. "What for? What do we need of a man in the winter?"

"It is not that to feed him is much, and all that he make vid de knife is mine. It is home he vants, no oder ting; he vork not for money."

"Father," said John earnestly, "there must be something wrong about that man. I have thought so from the first. Why should he work for nothing but his board, a great strong fellow like that, that could make good day's wages anywhere? Don't keep him after the harvest is over! I can't bear the sight of him."

"Den you can turn de eyes to your head, von oder way," retorted his father. "I find him goot to see, and," after a pause, "so do Carlen."

John started. "Good heavens, father!" he exclaimed.

"Oh, you need not speak by de heavens, mein son," rejoined the old man, in a taunting tone, "I tink I can mine own vay, vidout you to be help. I was not yesterday born!"

John was gone. Flight was his usual refuge when he felt his temper becoming too much for him; but now his steps were quickened by an impulse of terrible fear. Between him and his sister had always been a bond closer than is wont to link brother and sister. Only one year apart in age, they had grown up together in an intimacy like that of twins; from their cradles till now they had had their sports, tastes, joys, sorrows in common, not a secret from each other since they could remember; at least this was true of John; was he to find it no longer true of Carlen? He would know and that right speedily. As by a flash of lightning he thought he saw his father's scheme: if Carlen were to wed this man, this strong and tireless worker, this unknown, mysterious worker, who wanted only shelter and home, and cared not for money, what an invaluable hand would be gained on the farm! John groaned as he thought to himself how little anything, any doubt, any misgiving, perhaps even an actual danger, would in his father's mind outweigh the one fact that the

man did not "vork for money." As he walked toward the house, revolving these disquieting conjectures, all his first suspicion and antagonism toward Wilhelm revived in full force, and he was in a mood well calculated to distort the simplest acts, when he suddenly saw sitting in the square stoop at the door the two persons who filled his thoughts,—Wilhelm and Carlen, Wilhelm steadily at work as usual at his carving, his eyes closely fixed on it, his figure, as was its wont, rigidly still; and Carlen,—ah, it was an unlucky moment John had taken to search out the state of Carlen's feeling toward Wilhelm,—Carlen sitting in a posture of dreamy reverie, one hand lying idle in her lap holding her knitting, the ball rolling away unnoticed on the ground; her other arm thrown carelessly over the railing of the stoop, her eyes fixed on Wilhelm's bowed head.

John stood still and watched her, watched her long. She did not move. She was almost as rigidly still as Wilhelm himself. Her eyes did not leave his face. One might safely sit in that way by the hour and gaze undetected at Wilhelm. He rarely looked up except when he was addressed.

After standing thus a few moments John turned away, bitter and sick at heart. What had he been about, that he had not seen this? He, the loving comrade brother, to be slower of sight than the hard, grasping parent!

"I will ask mother," he thought. "I can't ask Carlen now! It is too late."

He found his mother in the kitchen, busy getting the bountiful supper which was a daily ordinance in the Weitbreck religion. To John's sharpened perceptions the fact that Carlen was not as usual helping in this labor loomed up into significance.

"Why does not Carlen help you, mütter," he said hastily. "What is she doing there idling with Wilhelm in the stoop?"

Frau Weitbreck smiled. "It is not always to vork, ven one is young," she said. "I haf not forget!" and she nodded her head meaningly.

John clenched his hands. Where had he been? Who had blinded him? How had all this come about, so soon, and without his knowledge? Were his father and his mother mad? He thought they must be. "It is a shame for that Wilhelm to so much as put his eyes on Carlen's face," he cried. "I think we are fools; what know we about him? I doubt him in and out. I wish he had never darkened our doors."

Frau Weitbreck glanced cautiously at the open door. She was frying sweet cakes in the boiling lard. Forgetting everything, in her fear of being overheard, she went softly with

the dripping skimmer in her hand across the kitchen, the fat falling on her shining floor at every step, and closed the door. Then she came close to her son, and said in a whisper, "The fader think it is goot." At John's angry exclamation she raised her hand in warning.

"Do not loud spraken," she whispered. "Carlen will hear."

"Well, then, she shall hear!" cried John half beside himself. "It is high time she did hear from somebody besides you and father! I reckon I've got something to say about this thing too, if I'm her brother. By —, no tramp like that is going to marry my sister without I know more about him!" and before the terrified old woman could stop him, he had gone at long strides across the kitchen, through the best room, and reached the stoop, saying in a loud tone: "Carlen! I want to see you."

Carlen started as one roused from sleep. Seeing her ball lying at a distance on the ground she ran to pick it up, and with scarlet cheeks and uneasy eyes turned to her brother.

"Yes, John," she said, "I am coming."

Wilhelm did not raise his eyes or betray by any change of feature that he had heard the sound or perceived the motion. As Carlen passed him her eyes involuntarily rested on his bowed head, a world of pity, perplexity in the glance. John saw it and frowned.

"Come with me," he said sternly. "Come down in the pasture; I want to speak to you."

Carlen looked up apprehensively into his face; never had she seen there so stern a look.

"I must help mütter with the supper," she said, hesitating.

John laughed scornfully. "You were helping with the supper, I suppose, sitting out with yon tramp!" and he pointed to the stoop.

Carlen had, with all her sunny cheerfulness, a vein of her father's temper. Her face hardened and her blue eyes grew darker.

"Why do you call Wilhelm a tramp?" she said coldly.

"What is he then, if he is not a tramp?" retorted John.

"He is no tramp," she replied, still more doggedly.

"What do you know about him?" said John.

Carlen made no reply. Her silence irritated John more than any words could have done; and losing self-control, losing sight of prudence, he poured out on her a torrent of angry accusation and scornful reproach.

She stood still, her eyes fixed on the ground. Even in his hot wrath John noticed this un-

wonted downcast look, and taunted her with it.

"You have even caught his miserable hang-dog trick of not looking anybody in the face," he cried. "Look up now! look me in the eye, and say what you mean by all this."

Thus roughly bidden, Carlen raised her blue eyes and confronted her brother with a look hardly less angry than his own.

"It is you who have to say to me what all this means that you have been saying," she cried; "I think you are out of your senses. I do not know what has happened to you," and she turned to walk back to the house.

John seized her shoulders in his brawny hands and whirled her round till she faced him again.

"Tell me the truth!" he said fiercely. "Do you love this Wilhelm?"

Carlen opened her lips to reply. At that second a step was heard, and looking up they saw Wilhelm himself coming toward them; walking at his usual slow pace, his head sunk on his breast, his eyes on the ground; great waves of blushes ran in tumultuous flood up Carlen's neck, cheeks, forehead. John took his hands from her shoulders and stepped back with a look of disgust and a smothered ejaculation. Wilhelm, hearing the sound, looked up, regarded them with a cold, unchanged eye, and turned in another direction.

The color deepened on Carlen's face. In a hard and bitter tone she said, pointing with a swift gesture to Wilhelm's retreating form:

"You can see for yourself that there is nothing between us. I do not know what craze has got into your head," and she walked away, this time unchecked by her brother. He needed no further replies in words. Tokens stronger than any speech had answered him. Muttering angrily to himself he went on down to the pasture after the cows. It was a beautiful field, more like New England than Pennsylvania; a brook ran zigzagging through it, and here and there in the land were sharp lifts where rocks cropped out, making miniature cliffs overhanging some portions of the brook's course. Gray lichens and green mosses grew on these rocks, and belts of wild flag and sedges surrounded their base. The cows, in a warm day, used to stand knee-deep in there in shade of the rocks.

It was a favorite place of Wilhelm's. He sometimes lay on the top of one of these rocks the greater part of the night, looking down into the gliding water or up into the sky. Carlen from her window had more than once seen him thus, and passionately longed to go down and comfort his lonely sorrow.

It was indeed true, as she had said to her brother, that there was "nothing between"

her and Wilhelm. Never a word had passed; never a look or tone to betray that he knew whether she were fair or not; whether she lived or not. She came and went in his presence, as did all others, with no more apparent relation to the currents of his strange veiled existence than if they, or he, belonged to a phantom world. But it was also true that never since the first day of his mysterious coming had Wilhelm been long absent from Carlen's thoughts; and she did indeed find him, as her father's keen eyes, sharpened by greed, had observed, good to look upon. That most insidious of love's allies, pity, had stormed the fortress of Carlen's heart, and carried it by a single charge. What could a girl give, do, or be, that would be too much for one so stricken, so lonely as was Wilhelm! The melancholy beauty of his face, his lithe figure, his great strength, all combined to heighten this impression, and to fan the flames of the passion in Carlen's virgin soul. It was indeed, as John had sorrowfully said to himself, "too late" to speak to Carlen.

As John stood now at the pasture bars, waiting for the herd of cows, slow winding up the slope from the brook, he saw Wilhelm on the rocks below. He had thrown himself down on his back, and lay there with his arms crossed on his breast. Presently he clasped both hands over his eyes as if to shut out a sight that he could no longer bear. Something akin to pity stirred even in John's angry heart as he watched him.

"What can it be," he said, "that makes him hate even the sky? It may be it is a sweetheart he has lost, and he is one of that strange kind of men who can love but once; and it is loving the dead that makes him so like one dead himself. Poor Carlen! I think myself he never so much as sees her."

A strange reverie, surely, for the brother who had so few short moments ago been angrily reproaching his sister for the disgrace and shame of caring for this tramp. But the pity was short-lived in John's bosom. His inborn distrust and antagonism to the man were too strong for any gentler sentiment toward him to live long by their side. And when the family gathered at the supper table he fixed upon Wilhelm so suspicious and hostile a gaze that even Wilhelm's absent mind perceived it, and he in turn looked inquiringly at John, a sudden bewilderment apparent in his manner. It disappeared, however, almost immediately, dying away in his usual melancholy absorption. It had produced scarce a ripple on the monotonous surface of his habitual gloom. But Carlen had perceived all, both the look on John's face and the bewilderment on Wilhelm's; and it roused in

her a resentment so fierce toward John, she could not forbear showing it. "How cruel!" she thought. "As if the poor fellow had not all he could bear already without being treated unkindly by us," and she redoubled her efforts to win Wilhelm's attention and divert his thoughts, all in vain; kindness and unkindness glanced off alike, powerless, from the veil in which he was wrapped.

John sat by with roused attention, sharpened perception, noting all. Had it been all along like this? Where had his eyes been for the past month? Had he too been under a spell? It looked like it. He groaned in spirit as he sat silently playing with his food, not eating; and when his father said: "Why hast thou not appetite, Johan?" he rose abruptly, pushed back his chair, and, leaving the table without a word, went out and down again into the pasture, where the dewy grass and the quivering stars in the brook shimmered in the pale light of a young moon. To John, also, the mossy rocks in this pasture were a favorite spot for rest and meditation. Since the days when he and Carlen had fished from their edges, with bent pins and yarn, for minnows, he had loved the place; they had spent happy hours enough there to count up into days, and not the least among the innumerable annoyances and irritations of which he had been anxious in regard to Wilhelm was the fact that he too had perceived the charm of the field, and chosen it for his own melancholy retreat.

As he seated himself on one of the rocks, he saw a figure gliding swiftly down the hill. It was Carlen.

"She thinks it is Wilhelm," he said, and again hot anger stirred in him.

As she drew near he looked at her without speaking, but the loving girl was not repelled. Springing lightly to the rock, she threw her arms around his neck, and, kissing him, said:

"I saw you coming down here, John, and I ran after you. Do not be angry with me, brother. It breaks my heart."

A sudden revulsion of shame for his unjust suspicion filled John with tenderness.

"*Mein Schwester*," he said, fondly,—they had always the habit of using the German tongue for fond epithets,—"*Mein Schwester klein*, I love you so much I cannot help being wretched when I see you in danger, but I am not angry."

Nestling herself close by his side, Carlen looked over into the water.

"This is the very rock I fell off of that day; do you remember?" she said, "and how wet you got fishing me out! And oh, what an awful beating father gave you, and I always

thought it was wicked, for if you had not pulled me out I should have drowned."

"It was for letting you fall in he beat me," laughed John, and they both grew tender and merry recalling the babyhood times.

"How long, long ago!" cried Carlen.

"It seems only a day," said John.

"I think time goes faster for a man than for a woman," sighed Carlen. "It is a shorter day in the fields than in the house."

"Are you not content, my sister?" said John.

Carlen was silent.

"You have always seemed so," he said reproachfully.

"It is always the same, John," she murmured. "Each day like every other day. I would like it to be some days different."

John sighed. He knew of what this new unrest was born. He longed to begin to speak of Wilhelm, and yet he knew not how. Now that, after longer reflection, he had become sure in his own mind that Wilhelm cared nothing for his sister, he felt an instinctive shrinking from recognizing to himself, or letting it be recognized between them, that she unwooded had learned to love. His heart ached with dread of the suffering which might be in store for her.

Carlen herself cut the gordian knot.

"Brother," she whispered, "why do you think Wilhelm is not good?"

"I said not that, Carlen," he replied evasively. "I only say we know nothing; and it is dangerous to trust where one knows nothing."

"It would not be trust if we knew," answered the loyal girl. "I believe he is good; but, John, John, what misery in his eyes; saw you ever anything like it?"

"No," he replied; "never. Has he never told you anything about himself, Carlen?"

"Once," she answered, "I took courage to ask him if he had relatives in Germany; and he said no, and I exclaimed then, 'What, all dead!' 'All dead,' he answered, in such a voice I hardly dared speak again, but I did. I said: 'Well, one might have the terrible sorrow to lose all one's relatives. It needs only that three should die, my father and mother and my brother,—only three, and two are already old, and I should have no relatives myself; but if one is left without relatives, there are always friends, thank God!' and he looked at me—he never looks at one, you know; but he looked at me then as if I had done a sin to speak the word, and he said, 'I have no friends. They are all dead too,' and then went away! Oh, brother, why cannot we win him out of this grief? We can be good friends to him; can you not find out for me what it is?"

It was a cruel weapon to use, but on the

instant John made up his mind to use it. It might spare Carlen grief, in the end.

"I have thought," he said, "that it might be for a dead sweetheart he mourned thus. There are men, you know, who love that way and never smile again."

Short-sighted John, to have dreamed that he could forestall any conjecture in the girl's heart!

"I have thought of that," she answered meekly; "it would seem as if it could be nothing else. But, John, if she be really dead——" Carlen did not finish the sentence. It was not necessary.

After a silence she spoke again:

"Dear John, if you could be more friendly with him I think it might be different. He is your age. Father and mother are too old, and to me he will not speak." She sighed deeply as she spoke these last words, and went on: "Of course, if it is for a dead sweetheart that he is grieving thus, it is only natural that the sight of women should be to him worse than the sight of men. But it is very seldom, John, that a man will mourn his whole life for a sweetheart; is it not, John? Why, men marry again, almost always, even when it is a wife that they have lost; and a sweetheart is not so much as a wife."

"I have heard," said the pitiless John, "that a man is quicker healed of grief for a wife than for one he had thought to wed, but lost."

"You are a man," said Carlen. "You can tell if that would be true?"

"No, I cannot," he answered, "for I have loved no woman but you, my sister; and on my word I think I will be in no haste to, either. It brings misery, it seems to me."

If Carlen had spoken her thought at these words, she would have said, "Yes, it brings misery; but even so it is better than joy." But Carlen was ashamed; afraid also; she had passed now into a new life, whither her brother, she perceived, could not follow. She could barely reach his hand across the boundary line which parted them.

"I hope you will love some one, John," she said. "You would be happy with a wife. You are old enough to have a home of your own."

"Only a year older than you, my sister," he rejoined.

"I too am old enough to have a home of my own," she said, with a gentle dignity of tone, which more impressed John with a sense of the change in Carlen than all else which had been said.

It was time to return to the house. As he had done when he was ten, and she nine, John stood at the bottom of the steepest rock, with upstretched arms, by the help of which Carlen leaped lightly down.

"We are not children any more," she said, with a little laugh.

"More's the pity!" said John, half lightly, half sadly, as they went on hand in hand.

When they reached the bars, Carlen paused. Withdrawing her hand from John's and laying it on his shoulder, she said:

"Brother, will you not try to find out what is Wilhelm's grief? Can you not try to be friends with him?"

John made no answer. It was a hard thing to promise.

"For my sake, brother," said the girl. "I have spoken to no one else but you. I would die before any one else should know; even my mother."

John could not resist this.

"Yes," he said, "I will try. It will be hard; but I will try my best, Carlen. I will have a talk with Wilhelm to-morrow." And the brother and sister parted, he only the sadder, she far happier, for their talk. "To-morrow," she thought, "I will know! To-morrow! oh, to-morrow!" and she fell asleep more peacefully than had been her wont for many nights.

On the morrow it chanced that John and Wilhelm went separate ways to work and did not meet until noon. In the afternoon Wilhelm was sent on an errand to a farm some five miles away, and thus the day passed without John's having found any opportunity for the promised talk. Carlen perceived with keen disappointment this frustration of his purpose, but comforted herself, thinking, with the swift forerunning trust of youth, "To-morrow he will surely get a chance. To-morrow he will have something to tell me. To-morrow!"

When Wilhelm returned from this errand, he came singing up the road. Carlen heard the voice and looked out of the window in amazement. Never before had a note of singing been heard from Wilhelm's voice. She could not believe her ears; neither her eyes, when she saw him walking swiftly, almost running, erect, his head held straight, his eyes gazing free and confident before him.

What had happened? What could have happened! Now, for the first time, Carlen saw the full beauty of his face; it wore an exultant look as of one set free, triumphant. He leaped lightly over the bars, he stooped and fondled the dog, speaking to him in a merry tone; then he whistled, then broke again into singing a gay German song. Carlen was stupefied with wonder. Who was this new man in the body of Wilhelm? Where had disappeared the man of slow-moving figure, bent head, downcast eyes, gloom-stricken face, whom until that hour she had known? Carlen clasped her hands in an agony of bewilderment.

"If he has found his sweetheart I shall die," she thought. "How could it be? A letter, perhaps? A message?" She dreaded to see him. She lingered in her room till it was past the supper hour, dreading what she knew not, yet knew. When she went down the four were seated at supper. As she opened the door, roars of laughter greeted her, and the first sight she saw was Wilhelm's face, full of vivacity, excitement. He was telling a jesting story, at which even her mother was heartily laughing. Her father had laughed till the tears were rolling down his cheeks. John was holding his sides. Wilhelm was a mimic, it appeared. He was imitating the ridiculous speech, gait, gestures, of a man he had seen in the village that afternoon.

"I sent you to village sooner as dis, if I haf known vat you are like ven you come back," said farmer Weitbreck, wiping his eyes.

And John echoed his father. "Upon my word, Wilhelm, you are a good actor. Why have you kept your light under a bushel so long?" and John looked at him with a new interest and liking. If this were the true Wilhelm, he might welcome him indeed as a brother.

Carlen alone looked grave, anxious, unhappy. She could not laugh. Tale after tale, jest after jest, fell from Wilhelm's lips. Such a story-teller never before sat at the Weitbreck board. The old kitchen never echoed with such laughter.

Finally John exclaimed: "Man alive, where have you kept yourself all this time? Have you been ill till now, that you hid your tongue? What has cured you in a day?"

Wilhelm laughed a laugh so ringing, it made him seem like a boy.

"Yes, I have been ill till to-day," he said, "and now I am well," and he rattled on again with his merry talk.

Carlen grew cold with fear; surely this meant but one thing. Nothing else, nothing less could have thus in an hour rolled away the burden of his sadness.

Later in the evening she said timidly, "Did you hear any news in the village this afternoon, Wilhelm?"

"No; no news," he said. "I had heard no news."

As he said this a strange look flitted swiftly across his face; was gone before any eye but a loving woman's had noted it. It did not escape Carlen's, and she fell into a reverie of wondering what possible double meaning could have underlain his words.

"Did you know Mr. Dietman in Germany?" she asked. This was the name of the farmer to whose house he had been sent on an errand. They were new-comers into the town, since spring.

"No!" replied Wilhelm, with another strange, sharp glance at Carlen. "I saw him not before."

"Have they children?" she continued. "Are they old?"

"No, young," he answered. "They haf one child, little baby."

Carlen could not contrive any other questions to ask.

"It must have been a letter," she thought, and her face grew sadder.

It was a late bed-time when the family parted for the night. The astonishing change in Wilhelm's manner was now even more apparent than it had yet been. Instead of slipping off, as was his usual habit, without exchanging a good-night with any one, he insisted on shaking hands with each, still talking and laughing with gay and affectionate words, and repeating, over and again, "Good-night, good-night." Farmer Weitbreck was carried out of himself with pleasure at all this, and holding Wilhelm's hand fast in his, shaking it heartily, and clapping him on the shoulder, he exclaimed, in fatherly familiarity: "Dis is goot, mein son! Dis is goot. Now are you von of us," and he glanced meaningly at John, who smiled back in secret intelligence. As he did so there went like a flash through his mind the question, "Can Carlen have spoken with him to-day? Can that be it?" But a look at Carlen's pale, perplexed face quickly dissipated this idea. "She looks frightened," thought John. "I do not much wonder. I will get a word with her." But Carlen had gone before he missed her. Running swiftly upstairs, she locked the door of her room, and threw herself on her knees at her open window. Presently she saw Wilhelm going down to the brook. She watched his every motion. First he walked slowly up and down the entire length of the field, following the brook's course closely, stopping often and bending over, picking flowers. A curious little white flower, called "Ladies-Tress," grew there in great abundance, and he often brought bunches of it to her.

"Perhaps it is not for me this time," thought Carlen, and the tears came into her eyes. After a time Wilhelm ceased gathering the flowers, and seated himself on his favorite rock; the same one where John and Carlen had sat the night before. "Will he stay there all night?" thought the unhappy girl as she watched him. "He is so full of joy he does not want to sleep. What will become of me! What will become of me!"

At last Wilhelm arose and came toward the house, bringing the bunch of flowers in his hand. At the pasture bars he paused, and looked back over the scene. It was a

beautiful picture, the moon making it light as day; even from Carlen's window could be seen the sparkle of the brook.

As he turned to go to the barn his head sank on his breast, his steps lagged. He wore again the expression of gloomy thought. A new fear arose in Carlen's breast. Was he mad? Had the wild hilarity of his speech and demeanor in the evening been merely a new phase of disorder in an unsettled brain? Even in this was a strange sad comfort to Carlen. She would rather have him mad, with alternations of insane joy and gloom, than know that he belonged to another. Long after he had disappeared in the doorway at the foot of the stairs which led to his sleeping place in the barn loft, she remained kneeling at the window watching to see if he came out again. Then she crept into bed and lay tossing, wakeful, and anxious till near dawn. She had but just fallen asleep when she was aroused by cries. It was John's voice. He was calling loudly at the window of their mother's bedroom beneath her own.

"Father! Father! Get up, quick! Come out to the barn!"

Then followed confused words she could not understand. Leaning from her window she called, "What is it, John? What has happened?" But he was already too far on his way back to the barn to hear her.

A terrible presentiment shot into her mind of some ill to Wilhelm. Vainly she wrestled with it. Why need she think everything that happened must be connected with him! It was not yet light; she could not have slept many minutes. With trembling hands she dressed, and running swiftly down the stairs was at the door just as her father appeared there.

"What is it? What is it, father?" she cried. "What has happened?"

"Go back!" he said, in an unsteady voice. "It is nothing. Go back to bed. It is not for vimmins!"

Then Carlen was sure it was some ill to Wilhelm, and with a loud cry she darted to the barn, and flew up the stairway leading to his room.

John, hearing her steps, confronted her at the head of the stairs.

"Good God, Carlen," he cried, "go back! You must not come here. Where is father?"

"I will come in!" she answered wildly, trying to force her way past him. "I will come in. You shall not keep me out. What has happened to him? Let me by," and she wrestled in her brother's strong arms with strength almost equal to his.

"Carlen! You shall not come in! You shall not see!" he cried.

"Shall not see!" she shrieked. "Is he dead?"

"Yes, my sister, he is dead," answered John solemnly. In the next instant he held Carlen's unconscious form in his arms; and when Farmer Weitbreck, half dazed, reached the foot of the stairs, the first sight which met his eyes was his daughter held in her brother's arms, apparently lifeless, her head hanging over his shoulder.

"Haf she seen him?" he whispered.

"No!" said John. "I only told her he was dead to keep her from going in, and she fainted dead away."

"Ach," groaned the old man, "dis is hard on her."

"Yes," sighed the brother; "it is a cruel shame."

Swiftly they carried her to the house and laid her on her mother's bed, then returned to their dreadful task in Wilhelm's chamber.

Hung by a stout leathern strap from the roof-tree beam, there swung the dead body of Wilhelm Rütter, cold, stiff; he had been dead for hours; he must have done the deed soon after bidding them good-night.

"He vas mad, Johan; it must be he vas mad, ven he laugh like dat last night. Dat vas de beginning, Johan," said the old man, shaking from head to foot with horror, as he helped his son lift down the body.

"Yes!" answered John. "That must be it. I expect he has been mad all along. I do not believe last night was the beginning. It was not like any sane man to be so gloomy as he was, and never speak to a living soul. But I never once thought of his being crazy. Look, father!" he continued, his voice breaking into a sob. "He has left these flowers here for Carlen! That does not look as if he was crazy! What can it all mean?"

On the top of a small chest lay the bunch of white "Ladies'-Tress," with a paper beneath it on which was written, "For Carlen Weitbreck, these, and the carvings in the box, all in memory of Wilhelm."

"He meant to do it, den," said the old man.

"Yes," said John.

"May be Carlen vould not haf him, you tink?"

"No," said John, hastily. "That is not possible."

"I tought she luf him, an' he vould stay an' be her mann," sighed the disappointed father. "Now all dat is no more."

"It will kill her," cried John.

"No!" said the father. "Vimmins does not die so as dat. She feel pad may be von year, may be two. Dat is all. He vas great for vork. Dat Alf vas not goot as he."

The body was laid once more on the narrow pallet where it had slept for its last few weeks on earth, and the two men stood by its side, discussing what should next be done, how the necessary steps could be taken with least possible publicity, when suddenly they heard the sound of horses' feet and wheels, and looking out they saw Hans Dietman and his wife driving rapidly into the yard.

"Mein Gott! Vat bring dem here dis time in day," exclaimed Farmer Weitbreck. "If dey ask for Wilhelm dey must all know!"

"Yes," replied John. "That makes no difference. Everybody will have to know," and he ran swiftly down to meet the strangely arrived neighbors.

His first glance at their faces showed him that they had come on no common errand. They were pale and full of excitement, and Hans's first word was:

"Vere is dot man you sent to mine place yesterday?"

"Wilhelm?" stammered Farmer Weitbreck.

"Wilhelm!" repeated Hans, scornfully. "His name is not 'Wilhelm.' His name is Carl; Carl Lepmann; and he is murderer; he killed von man—shepherd, in our town—last spring; and dey never get trail of him; so soon he came in our kitchen yesterday my wife she knew him; she wait till I get home. Ve came ven it was yet dark to let you know vot man was in your house."

Farmer Weitbreck and his son exchanged glances; each was too shocked to speak. Mr. and Mrs. Dietman looked from one to the other in bewilderment. "May pe you tink ve speak not truth," Hans continued. "Just let him come here, to our face, and you will see."

"No!" said John, in a low, awe-stricken voice, "we do not think you are not speaking truth." He paused; glanced again at his father. "We'd better take them up!" he said.

The old man nodded silently. Even his hard and phlegmatic nature was shaken to the depths.

John led the way up the stairs, saying briefly: "Come." The Dietmans followed in bewilderment.

"There he is," said John, pointing to the tall figure, rigid, under the close-drawn white folds; "we found him here only an hour ago, hung from the beam."

A horror-stricken silence fell on the group.

Hans spoke first. "He know dat we know; so he kill himself to save that de hangman have trouble."

John resented the flippant tone. He understood now the whole mystery of Wilhelm's life in this house.

"He has never known a happy minute since he was here," he said. "He never smiled;

nor spoke, if he could help it. Only last night, after he came back from your place, he laughed and sang, and was merry, and looked like another man; and he bade us all good-night over and over, and shook hands with every one. He had made up his mind, you see, that the end had come, and it was nothing but a relief to him. He was glad to die. He had not courage before. But now he knew he would be arrested he had courage to kill himself. Poor fellow, I pity him!" and John smoothed out the white folds over the clasped hands on the quiet-stricken breast, resting at last. "He has been worse punished than if he had been hung in the beginning," he said, and turned from the bed, facing the Dietmans as if he constituted himself the dead man's protector.

"I think no one but ourselves need know," he continued, thinking in his heart of Carlen. "It is enough that he is dead. There is no good to be gained for any one, that I see, by telling what he had done."

"No," said Mrs. Dietman tearfully; but her husband exclaimed, in a vindictive tone:

"I see not why it is to be covered in secret. He is murderer. It is to be sent vord to Mayence he was found."

"Yes, they ought to know there," said John slowly, "but there is no need for it to be known here. He has injured no one here."

"No," exclaimed Farmer Weitbreck. "He haf harm nobody here; he vas goot. I haf ask him to stay and haf home in my house."

It was a strange story. Early in the spring, it seemed, about six weeks before Hans Dietman and his wife Gretchen were married, a shepherd on the farm adjoining Gretchen's father's had been murdered by a fellow-laborer on the same farm. They had had high words about a dog, and had come to blows, but were parted by some of the other hands, and had separated and gone their ways to their work with their respective flocks.

This was in the morning. At night neither they nor their flocks returned, and search being made, the dead body of the younger shepherd was found lying at the foot of a precipice, mutilated and wounded, far more than it would have been by any accidental fall. The other shepherd, Carl Lepmann, had disappeared, and was never again seen by any one who knew him, until this previous day, when he had entered the Dietmans' door bearing his message from the Weitbreck farm. At the first sight of his face, Gretchen Dietman had recognized him, thrown up her arms involuntarily, and cried out in German, "My God! the man that killed the shepherd!" Carl had halted on the threshold at hearing these words, and his countenance had changed; but it was only for a second. He regained his composure in-

stantly, entered as if he had heard nothing, delivered his message, and afterward remained for some time on the farm chatting with the laborers, and seeming in excellent spirits.

"And so vas he ven he come home," said Farmer Weitbreck; "he make that ve all laugh and laugh, like notings ever vas before, never before he open his mouth to speak; he vas like at funeral all times, night and day. But now he seem full of joy. It is de most strange ting as I haf seen in my life."

"I do not think so, father," said John. "I do not wonder he was glad to be rid of his burden."

It proved of no use to try to induce Hans Dietman to keep poor Carl's secret. He saw no reason why a murderer should be sheltered from disgrace. To have his name held up for the deserved execration seemed to Hans the only punishment left for one who had thus evaded the hangman; and he proceeded to inflict this punishment to the extent of his ability.

Finding that the tale could not be kept secret, John nerved himself to tell it to Carlen. She heard it in silence from beginning to end, asked a few searching questions, and then to John's unutterable astonishment said, "Wilhelm never killed that man. You have none of you stopped to see if there was proof."

"But why did he fly, *Liebchen*?" asked John.

"Because he knew he would be accused of the murder," she replied. "They might have been fighting at the edge of the precipice, and the shepherd fell over, or the shepherd might have been killed by some one else, and Wilhelm have found the body. He never killed him, John, never."

There was something in Carlen's confident belief which communicated itself to John's mind, and coupled with the fact that there was certainly only circumstantial evidence against Wilhelm, slowly brought him to sharing her belief and tender sorrow. But they were alone in this belief and alone in their sorrow. The verdict of the community was unhesitatingly, unqualifiedly against Wilhelm.

"Would a man hang himself if he knew he were innocent?" said everybody.

"All the more if he knew he could never prove himself innocent," said John and Carlen. But no one else thought so. And how could the truth ever be known in this world?

Wilhelm was buried in a corner of the meadow field he had so loved. Before two years had passed, wild blackberry vines had covered the grave with a tangled mat of glossy leaves, green in summer, blood-red in the autumn. And before three more had passed there was no one in the place who

knew the secret of the grave. Farmer Weitbreck and his wife were both dead, and the estate had passed into the hands of strangers who had heard the story of Wilhelm, and knew that his body was buried somewhere on the farm; but in which field they neither asked nor cared, and there was no mourner to tell the story. John Weitbreck had realized his dream of going west, a free man at last, and by no means a poor one; he looked out over scores of broad fields of his own, one of the most fertile of the Oregon valleys.

Alf was with him, and Carlen; and Carlen was Alf's wife: placid, contented wife, and fond and happy mother,—so small ripples did there remain from the tempestuous waves beneath which Carl Lepmann's life had gone down. Some deftly carved boxes and figures of chamois and their hunters stood on Carlen's best room mantel, much admired by her neighbors, and longed for by her toddling girl,—these, and a bunch of dried and crumbling Ladies'-Tress blossoms, were all that had survived the storm. The dried flowers were in the largest of the boxes. They lay there side by side with a bit of carved abalone shell Alf had got from a Nez Percé Indian, and some curious seaweeds he had picked up at the mouth of the Columbia River. Carlen's one gilt brooch was kept in the same box, and when she took it out of a Sunday, the sight of the withered flowers always reminded her of Wilhelm. She could not have told why she kept them; it certainly was not because they woke in her breast any thoughts which Alf might not have read without being disquieted. She sometimes sighed, as she saw them, "Poor Wilhelm!" That was all.

But there came one day a letter to John that awoke even in Carlen's motherly and contented heart strange echoes from that past which she had thought forever left behind. It was a letter from Hans Dietman, who still lived on the Pennsylvania farm, and who had been recently joined there by a younger brother from Germany.

This brother had brought news which, too late, vindicated the memory of Wilhelm. Carlen had been right. He was no murderer.

It was with struggling emotions that Carlen heard the tale; pride, joy, passionate regret, old affection revived; John was half afraid to go on, as he saw her face flushing, her eyes filling with tears, kindling and shining with a light he had not seen in them since her youth.

"Go on! Go on!" she cried. "Why do you stop? Did I not tell you so? And you never half believed me! Now you see I was right! I told you Wilhelm never harmed a human being!"

It was indeed a heart-rending story, to come so late, so bootless now, to the poor boy who had slept all these years in the nameless grave, even its place forgotten.

It seemed that a man, sentenced in Mayence to be executed for murder, had confessed, the day before his execution, that it was he who had killed the shepherd of whose death Carl Lepmann had so long been held guilty. They had quarreled about a girl, a faithless creature, forsworn to both of them, and worth no man's love or desire; but jealous anger got the better of their sense, and they grappled in fight, each determined to kill the other.

The shepherd had the worst of it, and just as he fell, mortally hurt, Carl Lepmann had come up, had come up in time to see the murderer leap on his horse to ride away.

In a voice which the man said had haunted him ever since, Carl had cried out:

"My God! You ride away and leave him dead! and it will be I who have killed him, for this morning we fought, so they had to tear us apart!"

Smitten with remorse the man had with Carl's help lifted the body and thrown it over the precipice, at the foot of which it was afterward found. He then endeavored to persuade the lad that it would never be discovered, and he might safely return to his employer's farm. But Carl's terror was too great, and he had finally been so wrought upon by his entreaties that he had taken him two days' journey, by lonely ways, the two riding sometimes in turn, sometimes together,—two days' and two nights' journey,—till they reached the sea, where Carl had taken ship for America.

"He was a good lad, a tender-hearted lad,"

said the murderer. "He might have accused me in many a village, and stood as good chance to be believed as I, if he had told where the shepherd's body was thrown; but he could be frightened as easily as a woman, and all he thought of was to fly where he would never be heard of more. And it was the thought of him, from that day till now, has given me more misery than the thought of the dead man!"

Carlen was crying bitterly; the letter was just ended, when Alf came into the room asking bewilderedly what it was all about.

The name Wilhelm meant nothing to him. It was the summer before Wilhelm came that he had begun this Oregon farm, which he, from the first, had fondly dedicated to Carlen in his thoughts; and when he went back to Pennsylvania after her he found her the same as when he went away, only comelier and sweeter. It would not be easy to give Alf an uncomfortable thought about his Carlen. But he did not like to see her cry.

Neither when he had heard the whole story did he see why her tears need have flowed so freely. It was sad, no doubt, and a bitter shame too, for one man to suffer and go to his grave that way for the sin of another. But it was long past and gone; no use in crying over it now.

"What a tender-hearted, foolish wife it is!" he said in gruff fondness, laying his hand on Carlen's shoulder, "crying over a man dead and buried these seven years, and none of our kith or kin, either. Poor fellow. It was a shame!"

But Carlen said nothing.

MIGRATION.

THE caged bird that all the autumn day
In quiet dwells, when falls the autumn eve
Seeks how its liberty it may achieve,—
Beats at the wires and its poor wings doth fray:
For now desire of migrant change holds sway;
This summer-vacant land it longs to leave,
While its free peers on tireless pinions cleave
The haunted twilight, speeding south their way.
Not otherwise than as the prisoned bird
We here dwell careless of our captive state
Until light dwindles, and the year grows late,
And answering note to note no more is heard:
Then, our loved fellows flown, the soul is stirred
To follow them where summer has no date.

TYPICAL DOGS.—SETTERS.

FIELD ETHICS AND TRAINING.

TO those who are strangers to the peculiar fascination of field sports, the quality of a day's pleasure with dog and gun seems measurable by the quantity of game the sportsman may bring to bag; but the true sportsman is proud of the title which distinguishes him from a mere "pot hunter," and the merit of his methods is the outgrowth of a knowledge and practical application of the ethics of his guild. To him the fullness of the game-bag is but an incident of the day's sport, and when his brace of highly bred and thoroughly trained pointers or setters dash away over the stubble-field in the morning, no thought occurs of shooting into the bevy on the ground, even though the sun should go down upon an empty game-bag. Rather than kill a half dozen from the huddled bevy, he takes the chance of missing one bird, which he has singled out of the whirling bunch on the wing. The more difficult the shot, the greater the satisfaction when it is successfully made, and bringing down a bird with each barrel carries with it a double measure of joys; and if perchance one bird rises in front of him, and at the same time he catches the sound of another going away in an opposite direction, the blood leaps all the more quickly in his veins when a clean kill is scored on each.

But greater even than the pleasure of stopping his birds well on the wing is the satisfaction he feels in the excellent performances of his dogs. As they gallop back and forth across the stubble a short distance ahead of him, with their heads well up, feeling the air for the faintest taint of game, lashing their sides or hocks at every leap with their merry tail-action, the inspiration which makes their faces beam in anticipation of the pleasure the coveted odor promises, lights up the sportsman's countenance, and dogs and master take deep draughts from the same cup of joy, which is now overflowing with anticipation, and anon with reality. One dog fairly leaps into a "point," and, like a flash, his brace mate stops to a "back," perhaps fifty yards away.

Sluggish indeed must be the man's blood who could look upon such a picture unmoved. Even the most stoical philosopher would find himself lost in admiration at least of the marvelous exhibition of instinct and culture. Not five yards ahead of the pointing dog lie the bevy of quails, and the high-mettled dog, which a moment before went racing over the

field, stands motionless, save that there is a gentle tremor of the muscles, and an occasional champing of the jaws. The other dog seems a statue of exquisite pattern, standing simply in honor of his companion's point, which the ethics provide he must not interfere with.

After enjoying to the full the picture his dogs present, the sportsman advances slowly to the birds, and as they rise he selects one for each barrel. At the crack of the gun down go the dogs in their very tracks, as if shot; and although expressions of eagerness dance in their faces as they watch their master slowly reload his gun, neither dog moves until he hears his name, when he bounds away to the dead bird, which he had already marked down, and, lifting it carefully, he gleefully gallops back to his master.

The birds have been marked down not far away, perhaps, but they have scattered, and, lying close in the cover, are more difficult to find than when they were all together, moving about for food. A word of caution checks the pace of the dogs, and they move about now at a trot, feeling for the scent with the utmost care, all anxious for the pleasure of another point. Throughout the day good work continues, spiced with a little poor work, which tends to increased caution, unless it is the result of willfulness instead of carelessness. In such cases a stern look, or at most a few gentle taps from the sportsman's whip, serves to correct the fault.

So to handle his dogs that they may have the opportunity to display their talents is the sportsman's delight, for upon his own conduct depends largely the quality of the work his dogs may do, and it is their performances which furnish him the chief pleasure of the day. But the "pot hunter" not cultured in the sportsman's ethics can have no higher aim than a large bag of game.

To train a dog up to the standard of excellence now demanded, a man must not only be possessed of endless patience and perseverance, but he must have a keen sense of the effect of different conditions upon the highly organized nervous system of the dog, and have tact so to change the conditions that the desired effect on the organism will follow.

The training of pointers and setters is not, as might be supposed, the mere teaching of

AMERICAN SETTER "LARK." (FROM A STUDY BY J. M. TRACY; BY PERMISSION OF C. KLACKNER.)

a series of tricks ; it consists rather in developing such natural qualities as it is desirable to preserve, and in eradicating or checking those that are undesirable. Many good and bad characteristics are inherited alike, and they assert themselves without regard to their usefulness ; these the trainer must mold to suit his taste. Sometimes certain desirable qualities lie dormant, but the trainer must rouse them. In addition to those qualities which are fashioned from the instincts, certain accomplishments must be taught, but they must be so blended with those which are the outgrowth of special inheritance, that the dog shall not only know what he is required

to do, and how to do it, but that when properly done he as well as the sportsman will be pleased. Thus proper performance becomes simply an expression of his new nature.

C. B. Whitford.

THE GORDON SETTER.

THE origin of the Gordon setter is obscure. He first became prominent as a field-dog eighty-five years ago, or more, at the castle of the Duke of Gordon, from whom he derives his name. But for this nobleman we should probably never have known nor perpetuated this *ne plus ultra* of setters. The color of the Gordon setter, as seen at Gordon Castle, was undoubtedly black-and-tan, and black, white, and tan. Many of the best-bred dogs throw in their litters pups with white toes — one or two — and frills. A litter without some white is rare. Many black-and-tan setters we see have not a drop of Gordon blood in their veins ; nevertheless they are erroneously given the name of this famous strain. A pure Gordon can be told by a well-authenticated pedigree. To quote from a well-recognized authority, the Gordon setter should trace back to "Duke of Gordon's 'Regent,' old 'Bang,' old 'Dan,' or to Mr.

GORDON SETTER "GROUSE." (FROM A STUDY BY J. M. TRACY.)

Coke's 'Fan,' for the latter [Mr. Coke] and the Duke bred from the same stock. This is ample warrant for purity of lineage." In many respects the Gordon should resemble the English setter. The head of the former, however, should be a shade heavier and wider; nose moderately long and wide; no fullness under the eyes; nose should be wide and large in the openings, end of the nose to be a good black; ears, longer than those of the English setter, must be set low and lie close to the cheeks. The eyes must be full of animation,

sportsman. The coat should be soft, flat, and straight, not so long as that of the English setter, in color a rich plum-black, and very glossy. The tan markings should be a rich sienna, and should show on lips, cheeks, throat, over the eyes, under side of ear, on fore-legs nearly to the elbows, on the hind-legs to the stifles, and on under side of flag, but not running into his long hair. The Gordon setter should not stand at the shoulder higher than twenty-four, or twenty-four and a half, inches. I prefer even under the former size for

AMERICAN SETTER "GROUSEDALE." (FROM A PAINTING BY J. M. TRACY; BY PERMISSION OF C. KLACKNER.)

of a rich color, between brown and gold; the neck must be clean and racy. He should have deep, sloping shoulder-blades, a narrow deep chest with racy front. Beware of stooping hind-quarters; they show weakness and want of pace; they must be as strong as or stronger than the fore-quarters. He should have moderately well-bent stifles. I prefer a cat-foot, well filled in with hair between the pads. The stern should be carried very nearly straight. The flag should be shorter than that of the English setter, of graceful form; flat and scanty, tapering to nothing at the end. The Gordon setter should display much character. His outline must be good and taking at a glance to the eye of the

my shooting. In weight he should not exceed forty-five or fifty-five pounds. I prefer one rather under than over forty-five. Nothing is gained by breeding him up to the immense size seen at the bench shows. Such dogs as I describe will be with you afield for a week, with all the hard work you can give them. The Gordon setter is of the most affectionate disposition, easy to teach, of excellent memory, as steady at his work in the early autumn as at the last of the season. In natural qualities I know of no setter or pointer surpassing him. When well broken he is the pride of his master. I have bred, broken, and shot over this breed in all parts of America, on snipe, woodcock, prairie-chicken, and the best of them all—the

quail. After many years of hard hunting I know whereof I speak. In nose, endurance, stanchness, obedience, and speed—I have tried all—I know of none better. At work he is naturally a high-headed dog, seeking for the body-scent. When the weather is such as to require it, he is able to take the foot-scent as well. His instinct leads him to know where to look for game, without racing over every foot of ground, as is the habit of many other breeds of setters. He does his work in a business-like manner, not as if he were racing here and tearing there in quest of the spirit of some departed bird. Such a Gordon setter is rarely seen at the shows; but many such are owned by prominent sportsmen in this country, who, like myself, keep them for their own shooting, and care naught for public exhibitions.

Harry Malcolm.

THE AMERICAN SETTER.

WHILE a fondness for the dog has always characterized our people, a kind of odium attached to dog-fanciers until a few years ago. The austere Puritan of New England, stern in the practice as well as the precepts of his religion, forswore even the most innocent of amusements. No hunting was permitted for the simple pleasure it afforded. As a help to a lean larder the chase might be indulged in, but the moment it became a thing of pleasure or enjoyment, that instant it was to be discouraged. If perchance a man allowed his love for dog and gun to overcome the repressive ideas of his earlier training, he became as it were a "cast-off," a good-for-nothing "ne'er-do-well," to whom was ascribed a repugnance to honest labor in order to account for the vagabondage of his desires.

As population grew, the native New Englander migrated to other States, and carried with him all the peculiar convictions and beliefs in which he had been reared. Chief among them was the dislike, I may even say hatred, with which he regarded field sports and the time wasted in their pursuit; and the feeling, though misplaced, was at least an honest one. It served for years, however, to cast an aspersion upon those who loved the sports of the field, and who found intense enjoyment in following a well-trained hunting dog, whether setter or pointer. Under such a state of public feeling, the history of the setter of this country is, at best, but little better than a remembrance.

It is true, a few families of setter blood have been carefully bred, and by judicious crossing and selection have obtained somewhat of notoriety; but these representatives have been

few in number—scarce a half dozen; and probably not two of this half dozen can give a recorded family history of a quarter of a century. Among the best known breeders I would refer to Theo. Morford of Newton, William Grummon of Lyons Farms, and Justus von Lengerke of Hoboken, all in New Jersey; the Harrises of Providence, R. I., the late Paul Mead of Brooklyn, N. Y., E. H. Lathrop of Springfield, Mass., and Samuel Scranton, of Rhode Island.

Despite the repression I have mentioned, the love of hunting always existed and importations of good dogs were continually being made from the older countries. As a matter of course, the chief source from which these importations came was England. Communication with the different seaports of Great Britain was slow, but easy, through the different lines of packet-ships. Although travel was then difficult, it was much indulged in; and if the travelers happened to be fond of dog and gun, or had left friends at home who were, it followed as a natural sequence that a brace of setters was the most acceptable thing that could be brought back either as a remembrance of the trip or as a gift to those at home. Owing to the reasons I have spoken of, this constant refreshing of our setter blood was but little heard of beyond those directly interested. Upon arrival this blood was crossed upon what was now by acclimation native blood, and the result was a few familiar families of natives which soon stood preëminent in the sportsmen's world. Probably the best known and most widely heralded of all these dogs was the brace of black-and-tans presented to Daniel Webster by Lord Ashburton, and which were well known to all visitors at Marshfield. These dogs passed afterward into the possession of that most genial of New Yorkers, the late N. B. Blunt, and from them came some of the best setters of our vicinity.

The late N. C. Harris, of Providence, Rhode Island, captain of one of our finest packet-ships plying between New York and Liverpool, seldom made a trip without bringing home one or more dogs of undoubted worth. Coming of a family the members of which were ardently devoted to field sports, with the means and leisure to gratify the taste, no wonder the desire was followed to the full. Those I name are but a few among the many, and are mentioned merely to impress the fact that good dogs have been a favorite importation for many years, although that importation was but tame and insignificant in comparison with the number of good, bad, and indifferent, in the last decade.

The natural outcome of this continued

crossing was the breeding of many magnificent field-dogs, that achieved but little more than local renown, since there were in those days no journals willing to herald the achievements of a hunting dog.

Chief among the great setters of the day

that preserves its characteristics better when transported to other countries. An Irish setter is an Irish setter the world over, and for speed, endurance, pluck, intelligence, and nose has no superior. He is ever ready for his work, free and open-hearted in his ways, and

IRISH SETTER "LOU." (FROM A STUDY BY J. M. TRACY.)

is Grousedale (see illustration, page 118). In his veins the tides of native and foreign blood meet. He is from Waters's Grouse, and Daisy Dale, and is a little over the medium size; in color orange and white, the latter color predominating. In shape Grousedale is about all that can be desired, his every action denoting speed and power. His head is a pleasant one, while his eyes, dark and lustrous, show the wonderful intelligence for which the animal is noted. He first became well known to sportsmen at the inaugural meeting of the Eastern Field Trials Club, at Robins Island, Peconic Bay, December, 1879. His numerous victories since that time are a matter of record. I doubt if a better field-dog has ever been seen in this country, or a better broken and more intelligent setter.

Jacob Pentz.

THE IRISH SETTER.

THE Irish setter is without doubt one of the oldest of the setter breeds, and a descendant of the brown or liver-colored setting spaniel of four centuries ago.

He has been zealously guarded in certain Irish families for generations, and there is to-day no breed with stronger characteristics, or

has the faculty of adapting himself to every climate and all kinds of game, while his rich-colored coat and affectionate nature make him a pleasing companion when not required in the field. He is free from lumber, but has plenty of bone and muscle, and that energy which is his greatest fault in the minds of some, who seem to forget that without it there is never superiority. He stands a little higher than either the English or the Gordon setter, and is very bloodlike in appearance. His head is long, lean, narrow, high over the forehead and prominent at the occiput; the muzzle of good length, the lips deep, but not heavy like the hound's.

His ears, set low and lightly feathered, extend nearly to the nose, which may be a dark flesh in color, though a dark brown is preferable. His eyes, a hazel or deep brown, are soft and gentle in expression.

His neck is long, lean, clearly defined where it joins the head, and set well into a pair of sloping shoulders; the elbows well let down, the front legs straight, the feet firm and well clothed with hair to protect the soles. His chest is deep, loin arched and powerful; his stifles are well bent, and thighs broad and muscular. His hips are rather ragged, but they denote great power. His tail is nearly straight, gayly carried, and provided with a comb-like

fringe tapering to a pointed tip. His coat is short, flat, soft to the touch, and, where it extends into what is technically known as feathering, is like spun silk in quality.

His color is like the red of polished mahogany, or

"In gloss and hue the chestnut, when the shell
Divides threefold to show the fruit within,"

but only appears after the shedding of the tawny coat of puppyhood. This red, which may vary from a light shade to the deep, rich hue, belongs by right of a long inheritance to the Irish setter, and, except a little white which appears on the head and chest of many specimens, is the only legitimate color. The strains which show a black tip to the coat, or occasionally a black specimen, are beyond dispute impure.

William Jarvis.

THE LLEWELIN SETTERS.

THE dogs from which those now bearing the above name are descended made their first appearance at English field trials in 1871, when Dan and Dick, litter brothers, were brought out by Mr. Thomas Statter, of Stand Hall, Manchester, and won at Shrewsbury. In saying this I do not mean that Dan and Dick were of unknown pedigree, for this was not the case, as will presently appear, but only that these two, with their sister Dora, are ac-

LLEWELIN SETTER "GLADSTONE."
(FROM A PICTURE BY J. M. TRACY.)

cepted as the first specimens of this now celebrated strain.

To Mr. Statter and Mr. Barclay Field the honor of founding this strain belongs. It originated in the union of Field's Duke and Statter's Rhœbe. Duke, a noted trial winner, was descended from Sir F. Graham's celebrated kennel, and Rhœbe was a nearly pure Gordon. Later Mr. Statter bred Rhœbe to dogs of Mr. Laverack's breed, producing progeny of blood similar to Dan, Dick, and Dora, as the Laveracks were originally from the same strain as Sir F. Graham's dogs, and had also a cross of Gordon from Lord Lovat's kennel, to which it has been proved Mr. Laverack resorted, notwithstanding repeated assertions that his breed was free from all crosses.

LAVERACK SETTER "EMPEROR FRED." (FROM A PAINTING BY J. M. TRACY; BY PERMISSION OF C. KLACKNER, ESQ.)

Shortly after the Shrewsbury meeting of 1871, Mr. Llewellyn bought Dan, Dick, and Dora from Mr. Statter. It is proper to remark in this place that Mr. Llewellyn has never claimed any credit as being even in part an originator of the breed; but he does claim that he has developed and improved his branch of it into dogs of greater excellence than any others, and has given to them the fixed attributes which distinguish a true breed. Recognition of this, and also because he alone has preserved the strain in its original lines, both Mr. Statter and Mr. Field having introduced other crosses, has led all fair-minded men to concede Mr. Llewellyn's right to consider the breed now his own.

From its first introduction to the public this strain rapidly rose to be sensational. Its representatives swept the field trials of their prizes, and from this fact soon came to be known as the "field-trial breed." The honor thus gained was, however, coveted by other breeders for their dogs, and this name was unscrupulously appropriated for all such as were even in part of the same blood. This led to a definition of the field-trial strain, which was declared to be "the blood of Duke and Rhœbe, or of one or both of these crossed with the Laveracks." As illustrations of these various combinations I will cite Dan, who was of the Duke-Rhœbe blood alone; Rob Roy, by the Laverack Fred. out of Rhœbe; and Druid, by the Laverack Prince out of Dora, sister to Dan. It has been claimed that the above limitation will not hold good, as it includes three different combinations, and such variety is not admissible in any breed. This theory would be tenable but for the kindred origin of the Duke and Laverack blood; but this kinship being recognized (as it is by those who have investigated the Laverack history without prejudice, and who are not imposed upon by Mr. Laverack's preposterous table of pedigrees), it is evident there is no blood in any one of these combinations not present in the others, and consequently there is no inconsistency in claiming that all belong to the same breed.

The first field-trial setter brought to this country was Dart, by Prince out of Dora, imported in 1874 by Mr. L. H. Smith of Strathroy, Ontario, she being quickly followed by her dam Dora, imported by Mr. Luther Adams of Boston, who also brought out Rock, by Mr. Smith's Leicester, and by the writer's Rob Roy and Queen Mab. The success of Mr. Smith's pups in their first field trial, backed by the reputation of the breed abroad, at once established it in the esteem of our sportsmen, and led to further importations by the above gentlemen and others, and to a great demand for the dogs in all parts of the country.

These dogs continued to be known as "field-trial setters" till early in 1878, when Mr. Smith wrote to myself and others prominently engaged in breeding them, and proposed to change the name to Llewellyn setters, in recognition of what that gentleman had done for their improvement. So far as I know all promptly concurred; in any event, the name was adopted not only by breeders but by the public, and its propriety was unquestioned till of late, when attempts were made to show it was misapplied and Mr. Llewellyn not entitled to the honor it implied. I do not propose to discuss this matter, but I do not go too far in asserting that most American sportsmen still use the name and refuse to recognize the dogs by any other.

The characteristics of the Llewellyn setters are great beauty of physical form, joined to courage, intelligence, and field qualities of higher order than those possessed by any other breed. Their colors are blue and lemon beltons, black and white, dark lemon and white (called orange and white), black, white, and tan, and a few, liver and white, or liver, white, and tan. The above claim to superiority over other breeds is no outgrowth of the writer's partiality, but has been demonstrated in both England and this country by the fact that these dogs have won more prizes at field trials than the representatives of all other breeds combined. This is a matter of record.

Arnold Burges.

THE MODERN ENGLISH SETTER.

WHILE the pointer is known to have come originally from Spain, the setter cannot be proved other than of English origin. "Stonehenge" speaks of it as the most national of British dogs and as having certainly existed four centuries.

Edward Laverack, while claiming general deterioration through careless and injudicious breeding, in 1872 named a few kennels of choice blood that had been carefully guarded. Three of the sorts he commended have contributed to the blood of the recent importations—the "Gordon," the "Southesk," and his own, the "Laverack." He did not mention Sir Frederic Graham's, but it has proved one of the most useful of them all.

American sportsmen had imported English dogs as opportunity offered; but this was not often; and such as came had only the prestige of foreign birth, or perhaps of being from the kennel of a nobleman. Nearly all were without pedigrees with lines of noted ancestry. Without such, breeding is experimental—a slow, tentative process which few men have either interest or patience to de-

ENGLISH SETTER "HARRISON'S LONDON." (FROM A STUDY BY J. M. TRACY.)

velop. The change from an era of carelessness to one of such intense interest that it has often been styled a "dog craze," may be sketched as follows:

"Bench shows" and "field trials" in England, and the formation of the English Kennel Club, which published a book describing winning dogs and their breeding, were the means by which competition was developed and the results registered.

Correspondents gave in detail every item that could instruct the readers of our journals devoted to field sports.

Mr. Edward Laverack's breed became known through the bench winnings of his old Blue Dash and Fred. IV., and by the field-trial winnings of "Countess," "Nellie," and "Daisy" — full sisters.

Countess and Nellie belonged to R. Llewellyn Purcell Llewellyn, Esquire.

Daisy belonged to Richard Garth, Esquire, Q. C., now Chief Justice of India.

The possession of such dogs by Mr. Llewellyn, and the ability with which they were handled by his coadjutor, Mr. G. T. Teasdale Buckell, at the trials, disclosed a purpose and readiness to strike for the leadership of English setter-breeders. These gentlemen have for thirteen years bred the dogs that

have been most largely exported to this country — now known as the Llewellyn setter.

Mr. Laverack sent over Pride of the Border, Fairy, Fairy II., and others. Mr. Statter, of Manchester, gave us Rob Roy. Mr. Macdona contributed Ranger II. and Kirby. But while all these and others have been most usefully employed by American breeders, the Llewellyn setter probably outnumbers all others ten to one. Besides Countess and Nellie, Mr. Llewellyn had Prince and Lill II., both pure Laveracks. From them he bred Phantom, Petrel, Princess, and Puzzle, all bench-show champions.

With this array of the best Laveracks Mr. Llewellyn mated Dan, and the offspring are what "Stonehenge" calls the "Dan-Laveracks."

Dan, black, white, and tan, bred by Mr. Statter, was a son of Duke and Rhœbe. He came of noted ancestry, and won the Stafford field trials of 1871, in such brilliant manner that Mr. Llewellyn at once bought him for one hundred and fifty pounds, a great price at that time. He was an imperial-looking dog, with every desirable setter quality. The sire of Dan was Mr. Barclay Field's Duke, black and white. Duke had won four field trials, and his sister Kate was also a dog of note. Duke and Kate were bred by Sir Vin-

cent Corbet—their sire being Sir Frederic Graham's Duke. Their dam was a cross between Sir Frederic Graham's sort and that of the Earl of Beaudesert.

The dam of Dan was owned by Mr. Stat-ter; she was a cross of Gordon with Southesk. Seven of her immediate offspring won at field trials.

From Dan and Lill 2d, Countess, Nellie, Phantom, and Petrel have come the Llewellyn setters of greatest note and in largest number. "Stonehenge" admitted that they had carried all before them at field trials; and these winning animals now number six consecutive generations.

Kate, the sister to Duke (sire of Dan), was also crossed with the Laverack, and from them we have Dash II., to which dog Mr. Llewellyn resorted for an intercross. He is the ancestor of the dogs whose names have the prefix "Dashing," as "Dashing Bondhu," "Dashing Berwyn." He also used Dora, sister to Dan, as a reverse cross with the Laverack, and this, the "Prince-Dora," sort came to America among the earliest and best.

The "Llewellyn setter" has been defined to be dogs or their descendants bred by the gentleman whose name they bear, from a union

of the blood of Duke-Rhœbe, the Laverack or of either two of these breeds.

While fine dogs have been sent here, the best were kept at home. Those next to the best came here to avoid use in England (if sold there) against their breeders' interests and wishes.

But the slight shades of difference in individual dogs are not always observable in their offspring. Like not only begets like, but almost as often the likeness of an ancestor; hence our stock of imported dogs was practically not inferior to the best in England. Many persons in America have been breeding this setter for ten years. Only Mr. Llewellyn has bred it in England, but his is probably the best single kennel of setters in the world.

The dogs of to-day are intelligent, affectionate, beautiful, and highly endowed with the field qualities of speed, style, stanchness, and delicacy of olfactory to detect the lurking quarry. Dog and gun are helping to make us a nation of good shots, of hearty, stalwart manhood, never more at home than when camping upon an open prairie or walking with steady stride from morning until night over valleys and wooded hills, where grouse and quail abound.

J. C. Higgins.

AT ST. OSWALD'S.

WITHIN the church I knelt, where many a year
Wordsworth had worshiped, while his musing eye
Wandered o'er mountain, fell, and scar, and sky,
That rimmed the silver circle of Grasmere,
Whose crystal held an under-world as clear
As that which girt it round;—and questioned why
The place was sacred for *his* lifted sigh
More than the humble dalesman's kneeling near.

Strange spell of Genius!—that can melt the soul
To reverence tenderer than o'er it falls
Beneath the marvelous heavens which God hath made,
And sway it with such human-sweet control,
That holier henceforth seem these simple walls,
Because within them once a poet prayed!

Margaret J. Preston.

A LETTER FROM GENERAL GRANT TO HIS PHYSICIAN.

FAC-SIMILE OF THE CONCLUSION OF THE LETTER OF JULY 2, 1885, ADDRESSED TO
DR. JOHN H. DOUGLAS.

As I have stated I am thankful for the providential extension of my time to enable me to continue my work. I am further thankful, and in a much greater degree thankful, because it has enabled me to see for myself the happy harmony which has so suddenly sprung up between them engaged but a few short years ago in deadly conflict. It has been an inexpressible blessing to me to hear the kind expressions towards me in person from all parts of our country; from people of all nationalities of all religions, and of no religion, of Confederates and National troops alike; of

soldiers organizations; of me-
 chanical, scientific religions
 and all other societies embrac-
 ing almost every citizen in
 the land. They have
 brought me to my knees &
 they have not effected
 a cure. To you and your
 colleagues I acknowledge my
 indebtedness for having brought
 me through the "valley of the
 shadow of death" to enable
 me to witness these things.
 U. S. Grant

Mt. McGregor N.Y.
 July 20 1885.

FULL TEXT OF THE LETTER.

After General Grant's death, this letter was published in the newspapers. It is written in lead pencil on yellow memorandum paper of the width shown in the above fac-simile, which has been engraved for the magazine by permission of Dr. Douglas:

Dr. I ask you not to show this to any one, unless physicians you consult with, until the end. Particularly I want it kept from my family. If known to one man the papers will get it and they will get it. It would only distress them almost beyond endurance to know it, and, by reflex, would distress me. I have not changed my mind materially since I wrote you before in the same strain. Now, however, I know that I gain in strength some days, but when I do go back, it is beyond where I started to improve. I think the chances are very decidedly in favor of your being able to keep me alive until the change of weather, towards the winter. Of course there are contingencies that might arise at any time that would carry me off very suddenly. The most probable of these is choking. Under these circumstances life is not worth living. I am very thankful to have been spared this long, because it has enabled me to practically complete the work in which I take so much interest. I cannot stir up strength enough to review it and make additions and subtractions that would suggest themselves to me and are not likely to to any one else.

Under the above circumstances, I will be the happiest the

most pain I can avoid. If there is to be any extraordinary cure, such as some people believe there is to be, it will develop itself. I would say therefore to you and your colleagues to make me as comfortable as you can. If it is within God's providence that I should go now, I am ready to obey His call without a murmur. I should prefer going now to enduring my present suffering for a single day without hope of recovery. As I have stated, I am thankful for the providential extension of my time to enable me to continue my work. I am further thankful, and in a much greater degree thankful, because it has enabled me to see for myself the happy harmony which has so suddenly sprung up between those engaged but a few short years ago in deadly conflict. It has been an inestimable blessing to me to hear the kind expressions towards me in person from all parts of our country; from people of all nationalities; of all religions and of no religion; of Confederate and National troops alike; of soldiers' organizations; of mechanical, scientific, religious, and all other societies, embracing almost every citizen in the land. They have brought joy to my heart, if they have not effected a cure. To you and your colleagues I acknowledge my indebtedness for having brought me through the "valley of the shadow of death" to enable me to witness these things.

Mt. McGregor, N. Y. July 2, 1885.

U. S. GRANT.

GENERAL GRANT AT MT. MCGREGOR.

(FROM A PHOTOGRAPH OF GENERAL GRANT AND FAMILY, JUNE 19, 1885, BY RECORD & EPLER, SARATOGA SPRINGS, N. Y.)

CHATTANOOGA.

AFTER the fall of Vicksburg I urged strongly upon the Government the propriety of a movement against Mobile. General Rosecrans had been at Murfreesboro', Tennessee, with a large and well-equipped army from early in the year 1863, with Bragg confronting him, with a force quite equal to his own at first, considering it was on the defensive. But after the investment of Vicksburg, Bragg's army was largely depleted to strengthen Johnston, in Mississippi, who was being reënforced to raise the siege. I frequently wrote to General Halleck suggesting that Rosecrans should move against Bragg. By so doing he would either detain the latter's troops, or lay Chattanooga open to capture. General Halleck strongly approved the suggestion, and finally wrote me that he had repeatedly ordered Rosecrans to advance, but that the latter had constantly failed to comply with the order, and at last, after having held a council of war, replied, in effect, that it was a military maxim "not to fight two decisive battles at the same time." If true, the maxim was not applicable in this case. It would be bad to be defeated in two decisive battles fought the same day, but it would not be bad to win them. I, however, was fighting no battle, and the siege of Vicksburg had drawn from Rosecrans's front so many of the enemy that his chances of victory were much greater than they would be if he waited until the siege was over, when these troops could be returned. Rosecrans was ordered to move against the army that was detaching troops to raise the siege. Finally he did move on the 24th of June, but ten days afterward Vicksburg surrendered, and the troops sent from Bragg were free to return. It was at this time that I recommended to the general-in-chief the movement against Mobile. I knew the peril the Army of the Cumberland was in, being depleted continually not only by ordinary casualties, but also by having to detach troops to hold its constantly extending line over which to draw supplies, while the enemy in front was as constantly being strengthened. Mobile was important to the enemy, and, in the absence of a threatening force, was guarded by little else than artillery. If threatened by land and from the water at the same time, the prize would fall easily, or troops would have to be sent to its defense. Those troops would necessarily come from Bragg.

My judgment was overruled, however, and the troops under my command were dissipated over other parts of the country where it was thought they could render the most service. Four thousand were sent to Banks, at New Orleans; five thousand to Schofield, to use against Price, in Arkansas; the Ninth Corps back to East Tennessee; and finally, in August, the whole of the Thirteenth Corps to Banks. I also sent Ransom's brigade to Natchez, to occupy that point, and to relieve Banks from guarding any part of the river above what he had guarded before the fall of Port Hudson. Ransom captured a large amount of ammunition and about five thousand beef cattle that were crossing the river going east for the rebel armies.

At this time the country was full of deserters from Pemberton's army, and it was reported that many had also left Johnston. These avowed they would never go back to fight against us again. Many whose homes were west of the river went there, and others went North to remain until they could return with security.

Soon it was discovered in Washington that Rosecrans was in trouble and required assistance. The emergency was now too immediate to allow us to give this assistance by making an attack in the rear of Bragg upon Mobile. It was therefore necessary to reënforce directly, and troops were sent from every available point. On the 13th of September Halleck telegraphed me to send all available forces to Memphis, and thence east along the Memphis and Charleston railroad to coöperate with Rosecrans. This instruction was repeated two days later, but I did not get even the first until the 23d of the month. As fast as transports could be provided all the troops except a portion of the Seventeenth Corps were forwarded under Sherman, whose services up to this time demonstrated his superior fitness for a separate command. I also moved McPherson, with most of the troops still about Vicksburg, eastward, to compel the enemy to keep back a force to meet him. Meanwhile Rosecrans had very skillfully manoeuvred Bragg south of the Tennessee River, and through and beyond Chattanooga. If he had stopped and intrenched, and made himself strong there, all would have been right, and the mistake of not moving earlier partially compensated. But he pushed on, with his forces very much scattered, until Bragg's

troops from Mississippi began to join him.* Then Bragg took the initiative. Rosecrans had to fall back in turn, and was able to get his army together at Chickamauga, some miles south-east of Chattanooga, before the main battle was brought on. The battle was fought on the 19th and 20th of September, and Rosecrans was badly defeated, with a heavy loss in artillery, and some sixteen thousand men killed, wounded, and captured. The corps under Major-General George H. Thomas stood its ground, while Rosecrans, with Crittenden and McCook, returned to Chattanooga. Thomas returned also, but later, and with his troops in good order. Bragg followed and took possession of Missionary Ridge, overlooking Chattanooga. He also occupied Lookout Mountain, west of the town, which Rosecrans had abandoned, and with it his control of the river and river road as far back as Bridgeport. The National troops were now strongly intrenched in Chattanooga Valley, with the Tennessee River behind them, and the enemy occupying commanding heights to the east and west, with a strong line across the valley, from mountain to mountain, and Chattanooga Creek for a large part of the way in front of their line.

On the 29th of September Halleck telegraphed me the above results, and directed all the forces that could be spared from my department to be sent to Rosecrans, suggesting that a good commander like Sherman or McPherson should go with the troops; also that I should go in person to Nashville to superintend the movement. Sherman was already on his way and McPherson also was moving east with most of the garrison of Vicksburg long before this dispatch was received. I at once sent a staff-officer to Cairo, to communicate, in my name, directly with the Government, and to forward me any and all important dispatches without the delays that had attended the

transmission of previous ones. On the 3d of October a dispatch was received at Cairo ordering me to move with my staff and headquarters to that city, and to report from there my arrival. This dispatch reached me on the 10th. I left Vicksburg the same day, reached Cairo on the 16th, and reported my arrival at once. The reply came on the morning of the 17th, directing me to proceed immediately to the Galt House, Louisville, Kentucky, where I would meet an officer of the War Department with my instructions. I left Cairo within an hour after the receipt of this dispatch, going by rail by the way of Indianapolis, Indiana. Just as the train I was on was starting out of the depot at Indianapolis, a messenger came running up to stop it, saying the Secretary of War was coming into the station and wanted to see me. I had never met Mr. Stanton up to that time, though we had held frequent conversations over the wires, the year before, when I was in Tennessee. Occasionally, at night, he would order the wires freed from the War Department to my headquarters, and we would hold a conversation for an hour or two. On this occasion the Secretary was accompanied by Governor Brough, of Ohio, whom I had never met, though he and my father were old acquaintances. Mr. Stanton dismissed the special train that had brought him to Indianapolis and accompanied me to Louisville.

Up to this time no hint had been given me of what was wanted after I left Vicksburg, except the suggestion in one of Halleck's dispatches that I had better go to Nashville and superintend the operation of the troops sent to relieve Rosecrans. Soon after we had started, the Secretary handed me two orders, saying that I might take my choice of them. The two were identical in all but one particular. Both created the Military Division of the Mississippi, giving me the command, composed of

* Bragg was also reinforced by Longstreet, from the Army of Northern Virginia.—EDITOR.

the Departments of the Ohio, the Cumberland and the Tennessee, and all the territory from the Alleghanies to the Mississippi River, north of Banks's command in the south-west. One order left the department commanders as they were, while the other relieved Rosecrans and assigned Thomas to his place. I accepted the latter. We reached Louisville after night, and, if I remember rightly, in a cold, drizzling rain. The Secretary of War told me afterwards that he caught a cold on that occasion from which he never expected to recover. He never did recover.

A day was spent in Louisville, the Secretary giving me the military news at the capital, and talking about the disappointment at the results of some of the campaigns. By evening of the day after our arrival all matters of discussion seemed exhausted, and I left the hotel to spend the evening away, both Mrs. Grant and myself having relations living in Louisville. In the course of the evening Mr. Stanton received a dispatch from Mr. C. A. Dana, then in Chattanooga, informing him that unless prevented Rosecrans would retreat, and advising peremptory orders against his doing so.

A retreat at that time would have been a terrible disaster. It would not only have been the loss of a most important strategic position to us, but it would have been attended with the loss of all the artillery still left with the Army of the Cumberland, and the annihilation

of that army itself, either by capture or demoralization.

All supplies for Rosecrans had to be brought from Nashville. The railroad between this base and the army was in possession of the Government up to Bridgeport, the point at which the road crosses to the south side of the Tennessee River; but Bragg, holding Lookout and Raccoon mountains west of Chattanooga, commanded the railroad, the river, and the shortest and best wagon roads both south and north of the Tennessee, between Chattanooga and Bridgeport. The distance between these two places is but twenty-six miles by rail; but owing to this position of Bragg all supplies for Rosecrans had to be hauled by a circuitous route, north of the river, and over a mountainous country, increasing the distance to over sixty miles. This country afforded but little food for his animals, near ten thousand of which had already starved, and none were left to draw a single piece of artillery or even the ambulances to convey the sick. The men had been on half rations of hard bread for a considerable time, with but few other supplies, except beef driven from Nashville across the country. The region along the road became so exhausted of food for the cattle that by the time they reached Chattanooga they were much in the condition of the few animals left alive there, "on the lift." Indeed, the beef was so poor that the soldiers were in the habit of saying, with a faint facetiousness, that they

were living on half rations of hard bread and "beef dried on the hoof." Nothing could be transported but food, and the troops were without sufficient shoes or other clothing suitable for the advancing season. What they had was well worn. The fuel within the Federal lines was exhausted, even to the stumps of trees. There were no teams to draw it from the opposite bank, where it was abundant. The only means for supplying fuel, for some time before my arrival, had been to cut trees from the north bank of the river, at a considerable distance up the stream, form rafts of it, and float it down with the current, effecting a landing on the south side, within our lines, by the use of paddles or poles. It would then be carried on the shoulders of the men to their camps.

If a retreat had been ordered at this time it is not probable that any of the army would have reached the railroad as an organization, if followed by the enemy.

On the receipt of Mr. Dana's dispatch Mr. Stanton sent for me. Finding that I was out, he became nervous and excited, inquiring of every person he met, including guests of the house, whether they knew where I was, and bidding them find me and send me to him at once. About eleven o'clock I returned to the hotel, and on my way, when near the house, every person met was a messenger from the Secretary, apparently partaking of his impatience to see me. I hastened to the room of the Secretary and found him pacing the floor rapidly, in a dressing-gown. Saying that the retreat must be prevented, he showed me the dispatch. I immediately wrote an order assuming command of the Military Division of the Mississippi, and telegraphed it to General Rosecrans. I then telegraphed to him the order from Washington assigning Thomas to the command of the Army of the Cumberland; and to Thomas that he must hold Chattanooga at all hazards, informing him at the same time that I would be at the front as soon as possible. A prompt reply was received from Thomas, saying, "We will hold the town till we starve." I appreciated the force of this dispatch later when I witnessed the condition of affairs which prompted it. It looked, indeed, as if but two courses were open: one to starve, the other to surrender, or be captured.

On the morning of the 20th of October I started by train with my staff, and proceeded as far as Nashville. It was not prudent to travel beyond that point at that time by night, so I remained in Nashville until the next morning. Here I met for the first time Andrew Johnson, Military Governor of Tennessee. He delivered a speech of welcome.

His composure showed that it was by no means his maiden effort. It was long, and I was in torture while he was delivering it, fearing something would be expected from me in response. I was relieved, however, the people assembled having apparently heard enough. At all events they commenced a general hand-shaking which, although trying where there is so much of it, was a great relief to me in this emergency.

From Nashville I telegraphed to Burnside, who was then at Knoxville, that important points in his department ought to be fortified so that they could be held with the least number of men; to Admiral Porter at Cairo, that Sherman's advance had passed Eastport, Mississippi, and that rations were probably on their way from St. Louis, by boat, for supplying his army, and requesting him to send a gun-boat to convoy them; to Thomas, suggesting that large parties should be put at work on the wagon road then in use back to Bridgeport.

On the morning of the 21st we took the train for the front, reaching Stevenson, Alabama, after dark. Rosecrans was there on his way north. He came into my car, and we held a brief interview in which he described very clearly the situation at Chattanooga, and made some excellent suggestions as to what should be done. My only wonder was that he had not carried them out. We proceeded to Bridgeport, where we stopped for the night. From here we took horses and made our way by Jasper and over Waldron's Ridge to Chattanooga. There had been much rain and the roads were almost impassable from mud, knee-deep in places, and from washouts on the mountain-sides. I was on crutches at the time, and had to be carried over places where it was not safe to cross on horseback. The roads were strewn with the debris of broken wagons and the carcasses of thousands of starved mules and horses. At Jasper, some ten or twelve miles from Bridgeport, there was a halt. General O. O. Howard had his headquarters there. From this point I telegraphed Burnside to make every effort to secure five hundred rounds of ammunition for his artillery and small arms. We stopped for the night at a little hamlet some ten or twelve miles farther on. The next day we reached Chattanooga, a little before dark. I went directly to General Thomas's headquarters, and remained there a few days until I could establish my own.

During the evening most of the general officers called in to pay their respects and to talk about the condition of affairs. They pointed out on the maps the line marked with

REPRODUCED BY PERMISSION FROM "THE MILITARY HISTORY OF ULYSSES S. GRANT," BY GENERAL ADAM BADEAU.
(N. Y.: D. APPLETON & CO.)

a red or blue pencil which Rosecrans had contemplated falling back upon. If any of them had approved the move, they did not say so to me. I found General W. F. Smith occupying the position of chief-of-staff and chief engineer with the Army of the Cumberland. I had known Smith as a cadet at West Point, but had no recollection of having met him after my graduation, in 1843, up to this time. He explained the situation of the two armies,

and the topography of the country so plainly that I thought I could see it without an inspection. I found that he had established a saw-mill on the banks of the river, by utilizing an old engine found in the neighborhood; and by rafting logs from the north side of the river above had got out the lumber, and completed pontoons and roadway plank for a second bridge, one flying bridge being there already. He was also rapidly getting

out the materials for a third bridge. In addition to this he had far under way a steamer for plying between Chattanooga and Bridgeport whenever we might get possession of the river. This boat consisted of a scow made of the plank sawed out at the mill, housed in, and a stern-wheel attached which was propelled by a second engine taken from some shop or factory.

I telegraphed to Washington this night, notifying General Halleck of my arrival, and asking to have General Sherman assigned to the command of the Army of the Tennessee, headquarters in the field. The request was at once complied with.

The next day, the 24th, I started out to make a personal inspection, taking Thomas and Smith with me, besides most of the members of my personal staff. We crossed to the north side of the river, and moving to the north of detached spurs of hills, reached the Tennessee, at Brown's Ferry, some three miles below Lookout Mountain, unobserved by the enemy. Here we left our horses back from the river and approached the water on foot. There was a picket station of the enemy, on the opposite side, of about twenty men, in full view, and we within easy range. They did not fire upon us, nor seem to be disturbed by our presence. They must have seen that we were all commissioned officers. But I suppose they looked upon the garrison of Chattanooga as prisoners of war, feeding — or starving — themselves, and thought it would be inhuman to kill any of them except in self-defense. That night I issued orders for opening the route to Bridgeport — a cracker line, as the soldiers appropriately termed it. They had been so long on short rations that their first thought was the establishment of a line over which food might reach them.

Chattanooga is on the south bank of the Tennessee, where that river runs nearly due west. It is at the northern end of a valley five or six miles in width through which Chattanooga Creek runs. To the east of the valley is Missionary Ridge, rising from five to eight hundred feet above the creek, and terminating somewhat abruptly a half mile or more before reaching the Tennessee. On the west of the valley is Lookout Mountain, twenty-two hundred feet above tide-water. Just below the town, the Tennessee makes a turn to the south and runs to the base of Lookout Mountain, leaving no level ground between the mountain and river. The Memphis and Charleston railroad passes under this point, where the mountain stands nearly perpendicular. East of Missionary Ridge flows the South Chickamauga River; west of Lookout Mountain is Lookout Creek; and west of that, Raccoon Mountain. Look-

out Mountain, at its northern end, rises almost perpendicularly for some distance, then breaks off in a gentle slope of cultivated fields to near the summit, where it ends in a palisade thirty or more feet in height. On the gently sloping ground, between the upper and lower palisades, there is a single farm-house, which is reached by a wagon road from the valley east.

The intrenched line of the enemy commenced on the north end of Missionary Ridge and extended along the crest for some distance south, thence across Chattanooga valley to Lookout Mountain. Lookout Mountain was also fortified and held by the enemy, who also kept troops in Lookout valley west, and on Raccoon Mountain, with pickets extending down the river so as to command the road on the north bank and render it useless to us. In addition to this there was an intrenched line in Chattanooga valley extending from the river east of the town to Lookout Mountain, to make the investment complete. Besides the fortifications on Missionary Ridge there was a line at the base of the hill, with occasional spurs of rifle-pits half-way up the front. The enemy's pickets extended out into the valley towards the town, so that the pickets of the two armies could converse. At one point they were separated only by the narrow creek which gives its name to the valley and town, and from which both sides drew water. The Union lines were shorter than those of the enemy.

Thus the enemy, with a vastly superior force, was strongly fortified to the east, south, and west, and commanded the river below. Practically the Army of the Cumberland was besieged. The enemy had stopped, with his cavalry north of the river, the passing of a train loaded with ammunition and medical supplies. The Union army was short of both, not having ammunition enough for a day's fighting.

General Halleck had, long before my coming into this new field, ordered parts of the Eleventh and Twelfth corps, commanded respectively by Generals Howard and Slocum, Hooker in command of the whole, from the Army of the Potomac, to reinforce Rosecrans. It would have been folly to have sent them to Chattanooga to help eat up the few rations left there. They were consequently left on the railroad, where supplies could be brought them. Before my arrival Thomas ordered their concentration at Bridgeport.

General W. F. Smith had been so instrumental in preparing for the move which I was now about to make, and so clear in his judgment about the manner of making it, that I deemed it but just to him that he should have command of the troops detailed to execute the design, although he was then acting as a staff-officer, and was not in command of troops.

On the 24th of October after my return to Chattanooga, the following details were made: General Hooker, who was now at Bridgeport, was ordered to cross to the south side of the Tennessee and march up by Whiteside's, and Wauhatchie to Brown's Ferry. General Palmer, with a division of the Fourteenth Corps, Army of the Cumberland, was ordered to move down the river on the north side, by a back road until opposite Whiteside's, then cross, and hold the road in Hooker's rear after he had passed. Four thousand men were at the same time detailed to act under General Smith directly from Chattanooga. Eighteen hundred of them, under General Hazen, were to take sixty pontoon-boats and, under cover of night, float by the pickets of the enemy at the north base of Lookout, down to Brown's Ferry, then land on the south side and capture or drive away the pickets at that point. Smith was to march with the rest of the detail, also under cover of night, by the north bank of the river, to Brown's Ferry, taking with him all the material for laying the bridge, as soon as the crossing was secured.

On the 26th Hooker crossed the river at Bridgeport and commenced his eastward march. At three o'clock on the morning of the 27th Hazen moved into the stream with his sixty pontoons and eighteen hundred brave and well-equipped men. Smith started enough in advance to be near the river when Hazen should arrive. There are a number of detached spurs of hills north of the river at Chattanooga, back of which is a good road parallel to the stream, sheltered from view from the top of Lookout. It was over this road Smith marched. At five o'clock Hazen landed at Brown's Ferry, surprised the picket-guard and captured most of it. By seven o'clock the whole of Smith's force was ferried over and in possession of a height commanding the ferry. This was speedily fortified while a detail was laying the pontoon bridge. By ten o'clock the bridge was laid, and our extreme right, now in Lookout valley, was fortified and connected with the rest of the army. The two bridges over the Tennessee River,—a flying one at Chattanooga, and the new one at Brown's Ferry,—with the road north of the river, covered from both the fire and the view of the enemy, made the connection complete. Hooker found but slight obstacles in his way, and on the afternoon of the 28th emerged into Lookout valley at Wauhatchie. Howard marched on to Brown's Ferry, while Geary, who commanded a division in the Twelfth Corps, stopped three miles south. The pickets of the enemy on the river below were now cut off and soon came in and surrendered.

The river was now open to us from Lookout

valley to Bridgeport. Between Brown's Ferry and Kelley's Ferry the Tennessee runs through a narrow gorge in the mountains, which contracts the stream so much as to increase the current beyond the capacity of an ordinary steamer to stem. To get up this rapid, steamers must be cordelled, that is, pulled up by ropes from the shore. But there is no difficulty in navigating the stream from Bridgeport to Kelley's Ferry. The latter point is only eight miles from Chattanooga, and connected with it by a good wagon-road, which runs through a low pass in the Raccoon Mountains on the south side of the river to Brown's Ferry, thence on the north side to the bank of the river opposite Chattanooga. There were several steamers at Bridgeport, and abundance of forage, clothing, and provisions.

On the way to Chattanooga I had telegraphed back to Nashville for a good supply of vegetables and small rations, which the troops had been so long deprived of. Hooker had brought with him from the east a full supply of land transportation. His animals had not been subjected to hard work on bad roads without forage, but were in good condition. In five days from my arrival at Chattanooga the way was open to Bridgeport, and with the aid of steamers and Hooker's teams, in a week the troops were receiving full rations. It is hard for any one not an eye-witness to realize the relief this brought. The men were soon reclothed as well as fed, an abundance of ammunition was brought up, and a cheerfulness prevailed not before enjoyed in many weeks. Neither officers nor men looked upon themselves any longer as doomed. The weak and languid appearance of the troops, so visible before, disappeared at once. I do not know what the effect was on the other side, but assume it must have been correspondingly depressing. Mr. Davis had visited Bragg but a short time before, and must have perceived our condition to be about as Bragg described it in his subsequent report. "These dispositions," he said, "faithfully sustained, insured the enemy's speedy evacuation of Chattanooga, for want of food and forage. Possessed of the shortest route to his depot and the one by which reinforcements must reach him, we held him at our mercy, and his destruction was only a question of time." But the dispositions were not "faithfully sustained," and I doubt not but thousands of men engaged in trying to "sustain" them, now rejoice that they were not.

There was no time during the rebellion when I did not think, and often say, that the South was more to be benefited by defeat than the North. The latter had the people, the institutions and the territory to make a great

and prosperous nation. The former was burdened with an institution abhorrent to all civilized peoples not brought up under it, and one which degraded labor, kept it in ignorance, and enervated the governing class. With the outside world at war with this institution, they could not have extended their territory. The labor of the country was not skilled, nor allowed to become so. The whites could not toil without becoming degraded, and those who did were denominated "poor white trash." The system of labor would have soon exhausted the soil and left the people poor. The non-slaveholders would have left the country, and the small slaveholder must have sold out to his more fortunate neighbors. Soon the slaves would have outnumbered the masters, and not being in sympathy with them, would have risen in their might and exterminated them. The war was expensive to the South as well as to the North, both in blood and treasure; but it was worth all it cost.

The enemy was surprised by the movement which secured to us a line of supplies, and appreciated its importance, and hastened to try to recover the line from us. His strength on Lookout Mountain was not equal to Hooker's command in the valley below. From Missionary Ridge he had to march twice the distance we had from Chattanooga, in order to reach Lookout valley. But on the night of the 28th-29th an attack was made on Geary at Wauhatchie, by Longstreet's corps. When the battle commenced Hooker ordered Howard up from Brown's Ferry. He had three miles to march to reach Geary. On his way he was fired upon by rebel troops from a foothill to the left of the road, and from which the road was commanded. Howard turned to the left and charged up the hill, and captured it before the enemy had time to intrench, taking many prisoners. Leaving sufficient men to hold this height, he pushed on to reënforce Geary. Before he got up, Geary had been engaged for about three hours, against a vastly superior force. The night was so dark that the men could not distinguish one another except by the light of the flashes of their muskets. In the darkness and uproar Hooker's teamsters became frightened, and deserted their teams. The mules also became frightened, and breaking loose from their fastenings, stampeded directly toward the enemy. The latter no doubt took this for a charge, and stampeded in turn. By four o'clock in the morning the battle had entirely ceased, and our "cracker line" was never afterwards disturbed.

In securing possession of Lookout valley, Smith lost one man killed, and four or five wounded. The enemy lost most of his pickets at the ferry, captured. In the night engage-

ment of the 28th-29th Hooker lost four hundred and sixteen killed and wounded. I never knew the loss of the enemy, but our troops buried over one hundred and fifty of his dead, and captured more than a hundred.

Having got the Army of the Cumberland in a comfortable position, I now began to look after the remainder of my new command. Burnside was in about as desperate a condition as the Army of the Cumberland had been, only he was not yet besieged. He was a hundred miles from the nearest possible base, Big South Fork of the Cumberland River, and much farther from any railroad we had possession of. The roads back were over mountains, and all supplies along the line had long since been exhausted. His animals, too, had been starved, and their carcasses lined the road from Cumberland Gap, and far towards Lexington, Kentucky. East Tennessee still furnished supplies of beef, bread, and forage, but it did not supply ammunition, clothing, medical supplies, or small rations, such as coffee, sugar, salt, and rice.

As already stated, Sherman had been ordered from Vicksburg to Memphis before my assignment to the command of the Military Division of the Mississippi; at Memphis he was directed by the general-in-chief to organize as large a force as could be spared by Hurlbut, who was in command there, and to move with that and his own corps along the line of the Memphis and Charleston railroad to the relief of Chattanooga. He left Vicksburg on the 27th of September and was in Memphis on the 2d of October. Stopping to organize his new command, he started for Corinth on the 11th. His directions required him to repair the road in his rear in order to bring up supplies. The distance was about three hundred and thirty miles through a hostile country. His entire command could not have maintained the road if it had been completed. The bridges had all been destroyed by the enemy and much other damage done; a hostile community lived along the road; guerilla bands infested the country, and more or less of the cavalry of the enemy was still in the west. Often Sherman's work was destroyed as soon as completed, and he only a short distance away.

The Memphis and Charleston road strikes the Tennessee River at Eastport, Mississippi. Knowing the difficulty Sherman would have to supply himself from Memphis, I had previously ordered supplies sent from St. Louis on small steamers, to be conveyed by the navy, to meet him at Eastport. These he got. I now ordered him to discontinue his work of repairing roads, and to move on with his whole force to Stevenson, Alabama, without

delay. This order was borne to Sherman by a messenger who paddled down the Tennessee in a canoe, and floated over Muscle Shoals; it was delivered at Iuka on the 27th. In this Sherman was notified that the rebels were moving a force towards Cleveland, East Tennessee, and might be going to Nashville, in which event his troops were in the best position to beat them there. Sherman, with his characteristic promptitude, abandoned the work he was at, and pushed on at once. On the 1st of November he crossed the Tennessee at Eastport, and that day was in Florence, Alabama, with the head of column, while his troops were still crossing at Eastport, with Blair bringing up the rear.

Sherman's force made an additional army, with cavalry, artillery, and trains, all to be supplied by the single-track road from Nashville. All indications pointed also to the probable necessity of supplying Burnside's command, in East Tennessee, twenty-five thousand more, by the same road. A single track could not do this. I gave, therefore, an order to Sherman to halt General G. M. Dodge's command of eight thousand men at Athens, and subsequently directed the latter to arrange his troops along the railroad from Decatur, north towards Nashville, and to rebuild that road. The road from Nashville to Decatur passes over a broken country, cut up with innumerable streams, many of them of considerable width, and with valleys far below the road-bed. All the bridges over these had been destroyed by the enemy, and the rails taken up and twisted. All the locomotives and cars not carried off had been destroyed as effectually as they knew how. All bridges and culverts had been destroyed between Nashville and Decatur, and thence to Stevenson, where the Memphis and Charleston and the Nashville and Chattanooga roads unite. The rebuilding of this road would give us two roads as far as Stevenson over which to supply the army. From Bridgeport, a short distance further east, the river supplements the road.

General Dodge, besides being a most capable soldier, was an experienced railroad builder. He had no tools to work with but those of the pioneers—axes, picks, and spades. With these he was able to intrench his men, and protect them against surprises by small parties of the enemy. As he had no base of supplies until the road could be completed back to Nashville, the first matter to consider, after protecting his men, was the getting in of food and forage from the surrounding country. He had his men and teams bring in all the grain they could find, or all they needed, and all the cattle for beef, and such other food as could be found. Millers

were detailed from the ranks to run the mills along the line of the army; when these were not near enough to the troops for protection, they were taken down and moved up to the line of the road. Blacksmith shops, with all the iron and steel found in them, were moved up in like manner. Blacksmiths were detailed and set to work making the tools necessary in railroad and bridge building. Axemen were put to work getting out timber for bridges, and cutting fuel for the locomotives when the road was completed; car-builders were set to work repairing the locomotives and cars. Thus every branch of railroad building, making tools to work with, and supplying the workmen with food, was all going on at once, and without the aid of a mechanic or laborer except what the command itself furnished. But rails and cars the men could not make without material, and there was not enough rolling stock to keep the road we already had worked to its full capacity. There were no rails except those in use. To supply these deficiencies I ordered eight of the ten engines General McPherson had at Vicksburg to be sent to Nashville, and all the cars he had, except ten. I also ordered the troops in West Tennessee to points on the river and the Memphis and Charleston road, and the cars, locomotives, and rails from other railroads to be sent to the same destination. The military manager of railroads also was directed to furnish more rolling stock, and as far as he could, bridge material. General Dodge had the work assigned him finished within forty days after receiving his order. The number of bridges to rebuild was one hundred and eighty-two, many of them over deep and wide chasms. The length of road repaired was one hundred and two miles.

The enemy's troops, which it was thought were either moving against Burnside, or were going to Nashville, went no farther than Cleveland. Their presence there, however, alarmed the authorities at Washington, and on account of our helpless condition at Chattanooga, caused me much uneasiness. Dispatches were constantly coming, urging me to do something for Burnside's relief; calling attention to the importance of holding East Tennessee; saying the President was much concerned for the protection of the loyal people in that section, etc., etc. We had not at Chattanooga animals to pull a single piece of artillery, much less a supply train. Reënforcements could not help Burnside, because he had neither supplies nor ammunition sufficient for them; hardly indeed bread and meat for the men he had. There was no relief possible for him, except by expelling the enemy from Missionary Ridge and about Chattanooga.

On the 4th of November, Longstreet left our front with about fifteen thousand troops, besides Wheeler's cavalry, five thousand more, to go against Burnside.* The situation seemed desperate, and was more aggravating because nothing could be done until Sherman should get up. The authorities at Washington were now more than ever anxious for the safety of Burnside's army, and plied me with dispatches faster than ever, urging that something should be done for his relief. On the 7th, before Longstreet could possibly have reached Knoxville, I ordered Thomas peremptorily to attack the enemy's right so as to force the return of the troops that had gone up the valley. I directed him to take mules, officers' horses, or animals wherever he could get them, to move the necessary artillery. But he persisted in the declaration that he could not move a single piece of artillery, and could not see how he could possibly comply with the order. Nothing was left to be done but to answer Washington dispatches as best I could, urge Sherman forward, although he was making every effort to get forward, and encourage Burnside to hold on, assuring him that in a short time he would be relieved. All of Burnside's dispatches showed the greatest confidence in his ability to hold his position as long as his ammunition held out. He even suggested the propriety of abandoning the territory he held south and west of Knoxville, so as to draw the enemy farther from his base, and to make it more difficult for them to get back to Chattanooga when the battle should begin. Longstreet had a railroad as far as Loudon; but from there to Knoxville he had to rely on wagon trains. The suggestion, therefore, was a good one, and it was adopted. On the 14th I telegraphed Burnside :

"Sherman's advance has reached Bridgeport. His whole force will be ready to move from there by Tuesday at furthest. If you can hold Longstreet in check until he gets up, or, by skirmishing and falling back, can avoid serious loss to yourself, and gain time, I will be able to force the enemy back from here, and place a force between Longstreet and Bragg that must inevitably make the former take to the mountain-passes by every available road, to get to his supplies."

Longstreet, for some reason or other, stopped at Loudon until the 13th. That being the terminus of his railroad communications, it is probable he was directed to remain there awaiting orders. He was in a position threat-

* In the course of the preparation of this paper we asked General Grant, whether the detachment of Longstreet for the attack on Knoxville was not a great mistake on the part of Bragg. He replied in the affirmative; and when it was further presumed that Bragg doubtless thought his position impregnable, the Victor of Chattanooga answered, with a shrewd look that accentuated the humor of his words: "Well, it *was* impregnable."—EDITOR.

ening Knoxville, and at the same time where he could be brought back speedily to Chattanooga. The day after Longstreet left Loudon, Sherman reached Bridgeport in person, and proceeded on to see me that evening, the 14th, and reached Chattanooga the next day.

My orders for battle were all prepared in advance of Sherman's arrival, except the dates, which could not be fixed while troops to be engaged were so far away. The possession of Lookout Mountain was of no special advantage to us now. Hooker was instructed to send Howard's corps to the north side of the Tennessee, thence up behind the hills on the north side, and to go into camp opposite Chattanooga; with the remainder of the command Hooker was, at a time to be afterward appointed, to ascend the western slope between the upper and lower palisades, and so get into Chattanooga valley.*

The plan of battle was, for Sherman to attack the enemy's right flank, form a line across it, extend our left over South Chickamauga Creek, so as to threaten or hold the railroad in Bragg's rear,† and thus force him

* Hooker's position in Lookout valley was absolutely essential to us so long as Chattanooga was besieged. It was the key to our line for supplying the army. But it was not essential after the enemy was dispersed from our front, or even after the battle for this purpose was begun. Hooker's orders, therefore, were designed to get his force past Lookout Mountain and Chattanooga valley, and up to Missionary Ridge. By crossing the north face of Lookout the troops would come into Chattanooga valley in rear of the line held by the enemy across the valley, and would necessarily force its evacuation. Orders were accordingly given to Hooker to march by this route. But days before the battle began the advantages as well as the disadvantages of this plan of action were all considered. The passage over the mountain was a difficult one to make in the face of an enemy. It might consume so much time as to lose us the use of the troops engaged in it at other points where they were more wanted. After reaching Chattanooga valley, the creek of the same name, quite a formidable stream to get an army over, had to be crossed. I was perfectly willing that the enemy should keep Lookout Mountain until we got through with the troops on Missionary Ridge. By marching Hooker to the north side of the river, thence up the stream and recrossing at the town, they could be got in position at any named time; when in this new position they would have Chattanooga Creek behind them; and the attack on Missionary Ridge would unquestionably have caused the evacuation by the enemy of their line across the valley and on Lookout Mountain. Hooker's orders were changed accordingly. As explained elsewhere, the original order had to be reverted to because of a flood in the river rendering the bridge at Brown's Ferry unsafe for the passage of troops at the exact juncture when it was wanted to bring all the troops together against Missionary Ridge.—U. S. G.

† A bridge was thrown across the South Chickamauga at its mouth and a brigade of cavalry was sent across it. That brigade caused the bridge across the Holston River to be burned by the enemy and thus cut off Longstreet from coming back to Bragg.—EDITOR.

either to weaken his lines elsewhere or lose his connection with his base at Chickamauga Station. Hooker was to perform like service on our right. His problem was to get from Lookout valley to Chattanooga valley in the most expeditious way possible; cross the latter valley rapidly to Rossville, south of Bragg's line on Missionary Ridge, form line there across the ridge, facing north, with his right flank extended to Chickamauga valley east of the ridge, thus threatening the enemy's rear on that flank and compelling him to reënforce this also. Thomas, with the Army of the Cumberland, occupied the center, and was to assault while the enemy was engaged with most of his forces on his two flanks.

To carry out this plan, Sherman was to cross the Tennessee at Brown's Ferry, and move east of Chattanooga to a point opposite the north end of Missionary Ridge, and to place his command back of the foot-hills out of sight of the enemy on the ridge. There are two streams called Chickamauga emptying into the Tennessee River east of Chattanooga: North Chickamauga, taking its rise in Tennessee, flowing south and emptying into the river some seven or eight miles east; while the South Chickamauga, taking its rise in Georgia, flows northward, and empties into the Tennessee some four miles above the town. There were now one hundred and sixteen pontoons in the North Chickamauga River, their presence there unknown to the enemy. At night a division was to be marched up to that point, and at two o'clock in the morning to move down with the current, thirty men in each boat. A few were to land east of the mouth of the South Chickamauga, capture the pickets there, and then lay a bridge connecting the two banks of the river. The rest were to land on the south side of the Tennessee, where Missionary Ridge would strike it if prolonged, and a sufficient number of men to man the boats were to push to the north side to ferry over the main body of Sherman's command, while those left on the south side intrenched themselves.* Thomas was to move out from his lines facing the ridge, leaving enough of Palmer's corps to guard against an attack down the valley. Lookout valley being of no present value to us, and being untenable by the enemy if we should secure Missionary Ridge, Hooker's orders were changed. His revised orders brought him to Chattanooga by the established route north of the Tennessee. He was then to move out to the right to Rossville.

The next day after Sherman's arrival I took him, with Generals Thomas and Smith, and

other officers, to the north side of the river and showed them the ground over which Sherman had to march and pointed out generally what he was expected to do. I, as well as the authorities in Washington, was still in a great state of anxiety for Burnside's safety. Burnside himself, I believe, was the only one who did not share in this anxiety. Nothing could be done for him, however, until Sherman's troops were up. As soon, therefore, as the inspection was over, Sherman started for Bridgeport to hasten matters, rowing a boat himself, I believe, from Kelley's Ferry. Sherman had left Bridgeport the night of the 14th, reached Chattanooga the evening of the 15th, made the above inspection the morning of the 16th, and started back the same evening to hurry up his command, fully appreciating the importance of time.

His march was conducted with as much expedition as the roads and season would admit of. By the 20th he was himself at Brown's Ferry with head of column, but many of his troops were far behind, and one division, Ewing's, was at Trenton, sent that way to create the impression that Lookout was to be taken from the south. Sherman received his orders at the ferry, and was asked if he could not be ready for the assault the following morning. News had been received that the battle had been commenced at Knoxville. Burnside had been cut off from telegraphic communication. The President, the Secretary of War, and General Halleck were in an agony of suspense. Mine was also great, but more endurable, because I was where I could soon do something to relieve the situation. It was, however, impossible to get Sherman's troops up for the next day. I then asked him if they could not be got up to make the assault on the morning of the 22d, and ordered Thomas to move on that date. But the elements were against us. It rained all the 20th and 21st. The river rose so rapidly that it was difficult to keep the pontoons in place.

General Orlando B. Willcox, a division commander with Burnside, was at this time occupying a position farther up the valley than Knoxville,—about Maynardsville,—and was still in telegraphic communication with the North. A dispatch was received from him, saying that he was threatened from the east. The following was sent in reply: "If you can communicate with General Burnside, say to him that our attack on Bragg will commence in the morning. If successful, such a move will be made as, I think, will relieve East Tennessee, if he can hold out."

Meantime Sherman continued his crossing without intermission, as fast as his troops could be got up. The crossing had to be

* Not the original plan to which Sherman assented, which was to march at once for the north end of the ridge.—EDITOR.

effected in full view of the enemy on the top of Lookout Mountain. Once over, the troops soon disappeared behind the detached hills on the north side, and would not come to view again, either to watchmen on Lookout or Missionary Ridge, until they emerged between the hills to strike the banks of the river. But when Sherman's advance reached a point opposite the town of Chattanooga, Howard, who, it will be remembered, had been concealed behind the hills on the north side, took up his line of march to join the troops on the south side. His crossing was in full view both from Missionary Ridge and the top of Lookout, and the enemy, of course, supposed these troops to be Sherman's, who was thus enabled to get to his assigned position without discovery.

On the 20th, when so much was occurring to discourage, rains falling so heavily as to delay the passage of troops over the river at Brown's Ferry, and threatening the entire breaking of the bridge; news coming of a battle raging at Knoxville; of Willcox being threatened by a force from the east,—a letter was received from Bragg which contained these words: "As there may still be some non-combatants in Chattanooga, I deem it proper to notify you that prudence would dictate their early withdrawal." Of course I understood that this was a device intended to deceive; but I did not know what the intended deception was. On the 22d, however, a deserter came in who informed me that Bragg was leaving our front, and on that day Buckner's division was sent to reinforce Longstreet, at Knoxville, and another division started to follow, but was recalled. The object of Bragg's letter no doubt was in some way to detain me until Knoxville could be captured, and his troops there be returned to Chattanooga.

During the night of the 21st the rest of the pontoon-boats, completed, one hundred and sixteen in all, were carried up and placed in North Chickamauga. The material for the roadway over these was deposited out of view of the enemy within a few hundred yards of the bank of the Tennessee where the north end of the bridge was to rest.

Hearing nothing from Burnside, and hearing much of the distress in Washington on his account, I could no longer defer beginning operations for his relief. I determined therefore to do on the 23d, with the Army of the Cumberland, what had been intended to be done on the 24th.

The position occupied by the Army of the Cumberland had been made very strong for defense during the months it had been besieged. The line was about a mile from the town, and extended from Citico Creek, a small stream running near the base of Missionary

Ridge and emptying into the Tennessee about two miles below the mouth of the South Chickamauga, on the left, to Chattanooga Creek on the right. All commanding points on the line were well fortified and well equipped with artillery. The important elevations within the line had all been carefully fortified and supplied with a proper armament. Among the elevations so fortified was one to the east of the town, named Fort Wood. It owed its importance chiefly to the fact that it lay between the town and Missionary Ridge, where most of the strength of the enemy was. Fort Wood had on it twenty-two pieces of artillery, most of which would reach the nearer points of the enemy's line. On the morning of the 23d Thomas, according to instructions, moved Granger's corps of two divisions, Sheridan and T. J. Wood commanding them, to the foot of Fort Wood, and formed them into line as if going on parade,—Sheridan on the right, Wood on the left, extending to or near Citico Creek. Palmer, commanding the Fourteenth Corps, held that part of our line facing south and south-west. He supported Sheridan with one division, Baird's, while his other division, under Johnson, remained in the trenches, under arms, ready to be moved to any point. Howard's corps was moved in rear of the center. The picket lines were within a few hundred yards of each other. At two o'clock in the afternoon all were ready to advance. By this time the clouds had lifted so that the enemy could see from his elevated position all that was going on. The signal for advance was given by a booming of cannon from Fort Wood and other points on the line. The rebel pickets were soon driven back upon the main guards, which occupied minor and detached heights between the main ridge and our lines. These too were carried before halting, and before the enemy had time to reinforce their advance guards. But it was not without loss on both sides. This movement secured to us a line fully a mile in advance of the one we occupied in the morning, and one the enemy had occupied up to this time. The fortifications were rapidly turned to face the other way. During the following night they were made strong. We lost in this preliminary action about eleven hundred killed and wounded, while the enemy probably lost quite as heavily, including the prisoners that were captured. With the exception of the firing of artillery, kept up from Missionary Ridge and Fort Wood until night closed in, this ended the fighting for the day.

The advantage was greatly on our side now, and if I could only have been assured that Burnside could hold out ten days longer I should have rested more easily. But we were doing the best we could for him and the cause.

By the night of the 23d Sherman's command was in a position to move, though one division, Osterhaus's, had not yet crossed the river at Brown's Ferry. The continuous rise in the Tennessee had rendered it impossible to keep the bridge at that point in condition for troops to cross; but I was determined to move that night, even without this division. Orders were sent to Osterhaus accordingly to report to Hooker, if he could not cross by eight o'clock on the morning of the 24th. Because of the break in the bridge, Hooker's orders were again changed, but this time only back to those first given to him.

General W. F. Smith had been assigned to duty as chief engineer of the military division. To him was given the general direction of moving troops by the boats from North Chickamauga, laying the bridge after they reached their position, and generally, all the duties pertaining to his office of chief engineer. During the night General Morgan L. Smith's division was marched to the point where the pontoons were, and the brigade of Giles A. Smith was selected for the delicate duty of manning the boats, and surprising the enemy's pickets on the south bank of the river. During this night, also, General J. M. Brannan, chief of artillery, moved forty pieces of artillery belonging to the Army of the Cumberland, and placed them on the north side of the river so as to command the ground opposite, to aid in protecting the approach to the point where the south end of the bridge was to rest. He had to use Sherman's artillery horses for this purpose, Thomas having none.

At two o'clock in the morning, November 24th, Giles A. Smith pushed out from the North Chickamauga with his one hundred and sixteen boats, each loaded with thirty brave and well-armed men. The boats, with their precious freight, dropped down quietly with the current to avoid attracting the attention of any one who could convey information to the enemy, until arriving near the mouth of South Chickamauga. Here a few boats were landed, the troops debarked, and a rush was made upon the picket guard known to be at that point. The guard was surprised, and twenty of their number captured. The remainder of the troops effected a landing at the point where the bridge was to start, with equally good results. The work of ferrying over Sherman's command from the north side of the Tennessee was at once commenced, the pontoons being used for that purpose. A steamer was also brought up from the town to assist. The rest of M. L. Smith's division came first, then the division of J. E. Smith. The troops as they landed were put to work intrenching their position. By daylight the two

entire divisions were over, and well covered by the works they had built.

The work of laying the bridge on which to cross the artillery and cavalry was now begun. The ferrying over the infantry was continued with the steamer and the pontoons, the latter being taken, however, as fast as they were wanted to put in their place in the bridge. By a little past noon the bridge was complete, as well as one over the South Chickamauga, connecting the troops left on that side with their comrades below, and all the infantry and artillery were on the south bank of the Tennessee.

Sherman at once formed his troops for assault on Missionary Ridge. By one o'clock he started, with M. L. Smith on his left, keeping nearly the course of Chickamauga River; J. E. Smith next, to the right and a little in the rear; then Ewing, still farther to the right, and also a little to the rear of J. E. Smith's command, in column ready to deploy to the right if an enemy should come from that direction. A good skirmish line preceded each of these columns. Soon the foot of the hill was reached; the skirmishers pushed directly up, followed closely by their supports. By half-past three Sherman was in possession of the height, without having sustained much loss. A brigade from each division was now brought up, and artillery was dragged to the top of the hill by hand. The enemy did not seem to have been aware of this movement until the top of the hill was gained. There had been a drizzling rain during the day, and the clouds were so low that Lookout Mountain and the top of Missionary Ridge were obscured from the view of persons in the valley. But now the enemy opened fire upon their assailants, and made several attempts with their skirmishers to drive them away, but without avail. Later in the day a more determined attack was made, but it too failed, and Sherman was left to fortify what he had gained. Sherman's cavalry took up its line of march soon after the bridge was completed, and by half-past three the whole of it was over both bridges, and on its way to strike the enemy's communications at Chickamauga station. All of Sherman's command was now south of the Tennessee.

Thomas having done on the 23d what was expected of him on the 24th, there was nothing for him to do this day, except to strengthen his position. Howard, however, effected a crossing of Citico Creek and a junction with Sherman, and was directed to report to him. With two or three regiments of his command, he moved in the morning along the banks of the Tennessee and reached the point where the bridge was being laid. He went out on

the bridge as far as it was completed from the south end, and saw Sherman superintending the work from the north side, moving himself south as fast as an additional boat was put in and the roadway put upon it. Howard reported to his new chief across the chasm between them, which was now narrow, and in a few minutes was closed.

While these operations were going on to the east of Chattanooga, Hooker was engaged on the west. He had three divisions: Osterhaus's, of the Fifteenth Corps, Army of the Tennessee; Geary's, Twelfth Corps, Army of the Potomac; and Cruft's, Fourteenth Corps, Army of the Cumberland. Geary was on the right at Wauhatchie, Cruft at the center, and Osterhaus near Brown's Ferry. These troops were all west of Lookout Creek. The enemy had the east bank of the creek strongly picketed and intrenched, and three brigades of troops in the rear to reënforce them if attacked. These brigades occupied the summit of the mountain. General Carter L. Stevenson was in command of the whole. Why any troops except artillery, with a small infantry guard, were kept on the mountain-top, I do not see. A hundred men could have held the summit—a palisade for more than forty feet down—against the assault of any number of men from the position Hooker occupied.

The side of Lookout Mountain confronting Hooker's command was rugged, heavily timbered, and full of chasms, making it difficult to advance with troops, even in the absence of an opposing force. Farther up the ground becomes more even and level, and was in cultivation. On the east side the slope is much more gradual, and a good wagon-road, zigzagging up it, connects the town of Chattanooga with the summit.

Early in the morning of the 24th Hooker moved Geary's division, supported by a brigade of Cruft's, up Lookout Creek to effect a crossing. The remainder of Cruft's division was to seize the bridge over the creek, near the crossing of the railroad. Osterhaus was to move up to the bridge and cross it. The bridge was seized by Grose's brigade after a slight skirmish with the picket guarding it. This attracted the enemy so that Geary's movement farther up was not observed. A heavy mist obscured him from the view of the troops on the top of the mountain. He crossed the creek almost unobserved, and captured the picket of over forty men on guard near by. He then commenced ascending the mountain directly in his front. By this time the enemy was seen coming down from their camp on the mountain slope, and filing into their rifle-pits to contest the crossing of the bridge. By eleven o'clock the

bridge was complete; Osterhaus was up; and after some sharp skirmishing the enemy was driven away, with considerable loss in killed and captured.

While the operations at the bridge were progressing, Geary was pushing up the hill, over great obstacles, resisted by the enemy directly in his front, and in face of the guns on top of the mountain. The enemy, seeing their left flank and rear menaced, gave way and were followed by Cruft and Osterhaus. Soon these were up abreast of Geary, and the whole command pushed up the hill, driving the enemy in advance. By noon Geary had gained the open ground on the north slope of the mountain with his right close up to the base of the upper palisade, but there were strong fortifications in his front. The rest of the command coming up, a line was formed from the base of the upper palisade to the mouth of Chattanooga Creek.

Thomas and I were in person on the top of Orchard Knob. Hooker's advance now made our line a continuous one. It was in full view, extending from the Tennessee River, where Sherman had crossed, up Chickamauga River to the base of Missionary Ridge, over the top of the north end of the ridge, to Chattanooga valley; then along parallel to the ridge a mile or more; across the valley to the mouth of Chattanooga Creek; thence up the slope of Lookout Mountain to the foot of the upper palisade. The day was hazy, so that Hooker's operations were not visible to us except at moments when the clouds would rise. But the sound of his artillery and musketry was heard incessantly. The enemy on his front was partially fortified, but was soon driven out of his works. At two o'clock the clouds, which had so obscured the top of Lookout all day as to hide whatever was going on from the view of those below, settled down and made it so dark where Hooker was as to stop operations for the time. At four o'clock Hooker reported his position as impregnable.

By a little after five, direct communication was established, and a brigade of troops was sent from Chattanooga to reënforce him. These troops had to cross Chattanooga Creek, and met with some opposition, but soon overcame it, and by night the commander, General Carlin, reported to Hooker and was assigned to his left. I now telegraphed to Washington: "The fight to-day progressed favorably. Sherman carried the end of Missionary Ridge, and his right is now at the tunnel, and his left at Chickamauga Creek. Troops from Lookout valley carried the point of the mountain, and now held the eastern slope and point, high up. Hooker reports two

thousand prisoners taken, beside which, a small number have fallen into our hands, from Missionary Ridge." The next day the President replied: "Your dispatches as to fighting on Monday and Tuesday are here. Well done. Many thanks to all. Remember Burnside." And Halleck also telegraphed: "I congratulate you on the success thus far of your plans. I fear that Burnside is hard pushed, and that any further delay may prove fatal. I know you will do all in your power to relieve him."

The division of Jefferson C. Davis, Army of the Cumberland, had been sent to the North Chickamauga to guard the pontoons as they were deposited in the river, and to prevent all ingress or egress by citizens. On the night of the 24th his division, having crossed with Sherman, occupied our extreme left, from the upper bridge over the plain to the north base of Missionary Ridge. Firing continued to a late hour in the night, but it was not connected with an assault at any point.

At twelve o'clock at night, when all was quiet, I began to give orders for the next day, and sent a dispatch to Willcox to encourage Burnside. Sherman was directed to attack at daylight; Hooker was ordered to move at the same hour, and endeavor to intercept the enemy's retreat, if he still remained; if he had gone, then to move directly to Rossville and operate against the left and rear of the force on Missionary Ridge. Thomas was not to move until Hooker had reached Missionary Ridge. As I was with him on Orchard Knob he would not move without further orders from me.

The morning of the 25th opened clear and bright, and the whole field was in full view from the top of Orchard Knob. It remained so all day. Bragg's headquarters were in full view, and officers — presumably staff-officers — could be seen coming and going constantly.

The point of ground which Sherman had carried on the 24th was almost disconnected from the main ridge occupied by the enemy. A low pass, over which there is a wagon-road crossing the hill, and near which there is a railroad tunnel, intervenes between the two hills. The problem now was to get to the latter. The enemy was fortified on the point, and back farther, where the ground was still higher, was a second fortification commanding the first. Sherman was out as soon as it was light enough to see, and by sunrise his command was in motion. Three brigades held the hill already gained. Morgan L. Smith moved along the east base of Missionary Ridge; Loomis along the west base, supported by two brigades of John E. Smith's division; and Corse with his brigade was between the

two, moving directly towards the hill to be captured. The ridge is steep and heavily wooded on the east side, where M. L. Smith's troops were advancing, but cleared and with a more gentle slope on the west side. The troops advanced rapidly and carried the extreme end of the rebel work. Morgan L. Smith advanced to a point which cut the enemy off from the railroad bridge, and the means of bringing up supplies by rail from Chickamauga station, where the main depot was located. The enemy made brave and strenuous efforts to drive our troops from the position we had gained, but without success. The contest lasted for two hours. Corse, a brave and efficient commander, was badly wounded in this assault. Sherman now threatened both Bragg's flank and his stores, and made it necessary for him to weaken other points of his line to strengthen his right. From the position I occupied I could see column after column of Bragg's forces moving against Sherman; every rebel gun that could be brought to bear upon the Union forces was concentrated upon him. J. E. Smith, with two brigades, charged up the west side of the ridge to the support of Corse's command, over open ground, and in the face of a heavy fire of both artillery and musketry, and reached the very parapet of the enemy. He lay here for a time, but the enemy coming with a heavy force upon his right flank, he was compelled to fall back, followed by the foe. A few hundred yards brought Smith's troops into a wood, where they were speedily re-formed; when they charged and drove the attacking party back to his intrenchments.

Seeing the advance, repulse, and second advance of J. E. Smith from the position I occupied, I directed Thomas to send a division to reinforce him. One was sent from the right of Orchard Knob — Baird's — which had to march a considerable distance, directly under the eyes of the enemy, to reach its position.* Bragg at once commenced massing in the same direction. This was what I wanted. But it had now got to be late in the afternoon, and I had expected before this to see Hooker crossing the ridge in the neighborhood of Rossville, and compelling Bragg to mass in that direction also.

The enemy had evacuated Lookout Moun-

* Concerning this movement General Baird writes as follows: "I was ordered to report to General Sherman to reinforce his command. I marched the distance about two miles to the rear of his position, and sent an officer to report to him, but I immediately received orders to return and form on the left of the line which was to assault Missionary Ridge. I reached there, got my troops in position, just as the gun was fired directing the assault.

A. BAIRD,

"Brevet Major-General U. S. A." — [EDITOR.]

tain during the night, as I expected he would. In crossing the valley he burned the bridges over Chattanooga Creek, and did all he could to obstruct the roads behind him. Hooker was off bright and early, with no obstructions in his front but distance and the destruction above named. He was detained four hours in crossing Chattanooga Creek; and thus was lost the immediate advantages expected from his forces. His reaching Bragg's flank and extending across it was to be the signal for Thomas's assault of the ridge, but Sherman's condition was getting so critical that the assault for his relief could not be delayed any longer.

Sheridan's and Wood's divisions had been lying under arms from early in the morning, ready to move the instant the signal was given. I directed Thomas to order the charge at once. I watched eagerly to see the effect, and became impatient, at last, that there was no indication of any charge being made. The center of the line which was to make the charge was near where Thomas and I stood together, but concealed from our view by the intervening forest. Turning to Thomas to inquire what caused the delay, I was surprised to see General Thomas J. Wood, one of the division commanders who was to make the charge, standing talking to him. I spoke to General Wood, asking him why he had not charged, as ordered an hour before. He replied very promptly that this was the first he had heard of it, but that he had been ready all day to move at a moment's notice. I told him to make the charge at once. He was off in a moment; and in an incredibly short time loud cheering was heard, and he and Sheridan were driving the enemy's advance before them toward Missionary Ridge.

The enemy was strongly intrenched on the crest of the ridge in front of us, and had a second line half-way down, and another at the base. Our men drove the troops in front of the lower line of rifle-pits so rapidly, and followed them so closely, that rebel and Union troops went over the first line of works almost at the same time. Many rebels were captured and sent to the rear under the fire of their own friends higher up the hill. Those that were not captured retreated, and were pursued. The retreating hordes being between friends and pursuers, made the fire of the enemy high, to avoid killing their own men. In fact, on that occasion the Union soldier nearest the enemy was in the safest position. Without awaiting further orders or stopping to re-form, on our troops went to the second line of works; over that, and on for the crest, thus effectually carrying out my orders of the 18th for the battle and the 24th for this charge.

I watched their progress with intense interest. The fire along the rebel line was terrific. Cannon and musket balls filled the air; but the damage done was in small proportion to the ammunition used. The pursuit continued until the crest was reached, and soon our men were seen climbing over the Confederate barrier at different points in front of both Sheridan's and Wood's divisions. The retreat of the enemy along most of his line was precipitate, and the panic so great that Bragg and his officers lost all control over their men. Many were captured and thousands threw away their arms in their retreat.

Sheridan pushed forward until he reached the Chickamauga River at a point above where the enemy crossed. He met some resistance from troops occupying a second hill in rear of Missionary Ridge, probably to cover the retreat of the main body, and of the artillery and trains. It was now getting dark, but Sheridan, without halting on that account, pushed his men forward up this second hill slowly, and without attracting the attention of the men placed to defend it, while he detached to the right and left to surround the position. The enemy discovered the movement before these dispositions were complete, and beat a hasty retreat, leaving artillery, wagon trains, and many prisoners in our hands. To Sheridan's prompt movement the Army of the Cumberland and the nation are indebted for the bulk of the capture of prisoners, artillery, and small arms that day. But for his prompt pursuit, so much in this way would not have been accomplished.

While the advance up Missionary Ridge was going forward, General Thomas, with his staff, General Gordon Granger, commander of the corps making the assault, and myself and staff, occupied Orchard Knob, from which the entire field could be observed. The moment the troops were seen going over the last line of rebel defenses, I ordered Granger to join his command, and mounting my horse I rode to the front. General Thomas left about the same time. Sheridan, on the extreme right, was already in pursuit of the enemy east of the ridge. Wood, who commanded the division to the left of Sheridan, accompanied his men on horseback, but did not join Sheridan in the pursuit. To the left, in Baird's front, where Bragg's troops had massed against Sherman, the resistance was more stubborn, and the contest lasted longer. I ordered Granger to follow the enemy with Wood's division, but he was so much excited, and kept up such a roar of musketry, in the direction the enemy had taken, that by the time I could stop the firing the enemy had got well out of the way. The enemy confronting

Sherman, now seeing everything to their left giving away, fled also. Sherman, however, was not aware of the extent of our success until after nightfall, when he received orders to pursue at daylight in the morning.

Hooker, as stated, was detained at Chattanooga Creek by the destruction of the bridges at that point. He got his troops over, with the exception of the artillery, by fording the stream, at a little after three o'clock. Leaving his artillery to follow when the bridges should be completed, he pushed on with the remainder of his command. At Rossville he came upon the flank of a division of the enemy, which soon commenced a retreat along the ridge. This threw them on Palmer. They could make but little resistance in the position they were caught in, and as many of them as could, escaped. Many, however, were captured. Hooker's position during the night of the 25th was near Rossville, extending east of the ridge. Palmer was on his left, on the road to Graysville.

During the night I telegraphed to Willcox that Bragg had been defeated, and that immediate relief would be sent to Burnside if he could hold out; to Halleck I sent an announcement of our victory, and informed him that forces would be sent up the valley to relieve Burnside.

Before the battle of Chattanooga opened I had taken measures for the relief of Burnside the moment the way should be clear. Thomas was directed to have the little steamer that had been built at Chattanooga loaded to its capacity with rations and ammunition. Granger's corps was to move by the south bank of the Tennessee River to the mouth of the Holston, and up that to Knoxville, accompanied by the boat. In addition to the supplies transported by boat, the men were to carry forty rounds of ammunition in their cartridge-boxes, and four days' rations in haversacks.

In the battle of Chattanooga troops from the Army of the Potomac, from the Army of the Tennessee, and from the Army of the Cumberland participated. In fact the accidents growing out of the heavy rains and the sudden rise in the Tennessee River so mingled the troops that the organizations were not kept together under their respective commanders during the battle. Hooker, on the right, had Geary's division of the Army of the Potomac; Osterhaus's, of the Army of the Tennessee; and Cruft's, of the Army of the Cumberland. Sherman had three divisions of his own army, Howard's corps, from the Army of the Potomac, and Jeff. C. Davis's division of the Army of the Cumberland. There was no jealousy, hardly rivalry. Indeed I doubt

whether officers or men took any note at the time of this intermingling of commands. All saw a defiant foe surrounding them, and took it for granted that every move was intended to dislodge him, and it made no difference where the troops came from so this end was accomplished.

The victory at Chattanooga was won against great odds, considering the advantage the enemy had of position; and was accomplished more easily than was expected by reason of Bragg's making several grave mistakes,—first, in sending away his ablest corps commander, with over twenty thousand troops; second, in sending away a division of troops on the eve of battle; third, in placing so much of a force on the plain in front of his impregnable position.

It was known that Mr. Davis had visited Bragg on Missionary Ridge, a short time before my reaching Chattanooga. It was reported and believed that he had come out to reconcile a serious difference between Bragg and Longstreet, and finding this difficult to do planned the campaign against Knoxville, to be conducted by the latter general. I had known both Bragg and Longstreet before the war, the latter very well. We had been three years at West Point together, and, after my graduation, for a time in the same regiment. Then we served together in the Mexican war. I knew Bragg in Mexico, and met him occasionally subsequently. I could well understand how there might be an irreconcilable difference between them. Bragg was a remarkably intelligent and well-informed man, professionally and otherwise. He was also thoroughly upright. But he was possessed of an irascible temper, and was naturally disputatious. A man of the highest moral character and the most correct habits, yet in the old army he was in frequent trouble. As a subordinate he was always on the lookout to catch his commanding officer infringing upon his prerogatives; as a post commander he was equally vigilant to detect the slightest infringement of the most trivial order. I have heard in the old army an anecdote told characteristic of Bragg. On one occasion, when stationed at a post of several companies, commanded by a field-officer, he was himself commanding one of the companies and at the same time acting post quartermaster and commissary. He was a first lieutenant at the time; but his captain was detached on other duty. As commander of the company he made a requisition upon the quartermaster—himself—for something he wanted. As quartermaster he declined to fill the requisition, and indorsed on the back of it his reason for so doing. As company commander he responded to this,

urging that his requisition called for nothing but what he was entitled to, and that it was the duty of the quartermaster to fill it. The quartermaster still persisted that he was right. In this condition of affairs Bragg referred the whole matter to the commanding officer. The latter, when he saw the nature of the matter referred, exclaimed: "My God, Mr. Bragg, you have quarreled with every officer in the army, and now you are quarreling with yourself."

Longstreet was an entirely different man. He was brave, honest, intelligent, a very capable soldier, subordinate to his superiors, just and kind to his subordinates, but jealous of his own rights, and with the courage to maintain them. He was never on the lookout to detect a slight, but saw one as quickly as anybody when intentionally given.

It may be that Longstreet was not sent to Knoxville for the reason stated, but because Mr. Davis had an exalted opinion of his own military genius, and thought he saw a chance of "killing two birds with one stone." On several occasions during the war he came to the relief of the Union army by means of his *superior military genius*.

I speak advisedly when I say Mr. Davis prided himself on his military capacity. He says so himself virtually, in his answer to the notice of his nomination to the Confederate Presidency. Some of his generals have said so in their writings since the downfall of the Confederacy. Whatever the cause or whoever is to blame, grave mistakes were made at Chattanooga, which enabled us, with the undaunted courage of the troops engaged, to gain a great victory, under the most trying circumstances presented during the war, much more easily than could otherwise have been attained. If Chattanooga had been captured, East Tennessee would have followed without a struggle. It would have been a victory to have got the army away from Chattanooga safely. It was manifold greater to defeat, and nearly destroy, the besieging army.

In this battle the Union army numbered in

round figures about sixty thousand men; we lost a little over seven hundred killed, and four thousand eight hundred and fifty wounded and missing. The rebel loss was much greater in the aggregate, as we captured, and sent North to be rationed there, over six thousand one hundred prisoners. Forty pieces of artillery, over seven thousand stand of small arms, and many caissons, artillery wagons, and baggage wagons fell into our hands. The probabilities are that our loss in killed was the heavier, as we were the attacking party. The enemy reported his loss in killed at three hundred and sixty-one; but as he reported his missing at four thousand one hundred and forty-six, while we held over six thousand of them as prisoners, and there must have been hundreds, if not thousands, who deserted, but little reliance can be placed in this report. There was certainly great dissatisfaction with Bragg, on the part of the soldiers, for his harsh treatment of them, and a disposition to get away if they could. Then, too, Chattanooga following in the same half-year with Gettysburg in the East, and Vicksburg in the West, there was much the same feeling in the South at this time that there had been in the North the fall and winter before. If the same license had been allowed the people and the press in the South that was allowed in the North, Chattanooga would probably have been the last battle fought for the preservation of the Union.

Bragg's army now being in full retreat, the relief of Burnside's position at Knoxville was a matter for immediate consideration. Sherman marched with a portion of the Army of the Tennessee, and one corps of the Army of the Cumberland, towards Knoxville; but his approach caused Longstreet to abandon the siege long before these troops reached their destination. Knoxville was now relieved; the anxiety of the President was relieved, and the loyal portion of the North rejoiced over the double victory: the raising of the siege of Knoxville and the victory at Chattanooga.

U. S. Grant.

MEMORANDA ON THE CIVIL WAR.

Was Chattanooga Fought as Planned?

EDITOR OF THE CENTURY MAGAZINE:

From the article entitled "General Grant," in your very interesting May edition, I make the following extracts having reference to the battle of Chattanooga:

"Chattanooga came next. This was the most elaborate of all Grant's battles, the most like a game between skillful players. Few battles in any war have ever been fought so strictly according to the plan. . . . This battle more closely resembled those of European commanders and European fields than any other great engagement of the American war. . . . And, while undoubtedly the contingencies that were unforeseen contributed to the result,—for Grant always knew how to avail himself of unexpected emergencies,—it still remains that this battle was fought as nearly according to the plan laid down in advance as any recorded in the schools."

Holding, at the time of the battle of Chattanooga, the position of chief engineer of the Army of the Cumberland under General Thomas, and being at the same time chief engineer of the Military Division of the Mississippi under General Grant, it was absolutely necessary that I should know the plan to be able to direct the engineering operations. I desire to give to your readers the original plan as "laid down in advance" and a sketch of the battle as fought, for comparison with the statements which I have quoted.

The original plan of the battle of Chattanooga was to turn Bragg's right flank on Missionary Ridge, thereby throwing his army away from its base and natural line of retreat. This, the first thing to be done, was confided to Sherman, *and the plan was not adopted* till after Sherman had carefully examined the situation and asserted that he could do the work assigned to him. Thomas was to hold the center and right of our front, to coöperate with Sherman, and attack when the proper time arrived.

The preliminary movements were simple and can be given in few words. Sherman was to effect a lodgment on the left bank of the Tennessee River, just below the mouth of the South Chickamauga Creek. This was to be done by landing a brigade of troops from the boats, which were to be used in the bridge to be thrown at that point across the Tennessee for the crossing of Sherman's army. One division of Sherman's army was to march up the Lookout valley, on the extreme right of our operations, and threaten a pass in Lookout Mountain, ostensibly to turn Bragg's *left* flank. The march was to be made in daylight, in sight of the enemy, and after dark the division was to retrace its steps, cross the Tennessee at Brown's Ferry, and join the main body of Sherman's force, which was to be massed during the night preceding the intended attack at the point where the bridge was to be laid. Hooker with his small force was to hold Lookout valley and threaten Lookout Mountain at the point where it strikes the Tennessee. This general plan was filled in with all necessary details, embracing all the initial movements of the whole force under

Grant. At the very outset began the changes in this plan. The division which made the threat against Bragg's left flank on returning found the bridge at Brown's Ferry impassable; and as it could not join Sherman, it was turned over to Hooker, who was ordered, with his command thus strengthened, to assault the works on his front on Lookout Mountain. This was a most decided change from the plan "laid down in advance."

On the evening of the first day the results could be summed up as follows: Sherman had crossed the Tennessee River at the point selected, but had not turned Bragg's right flank. Thomas had drawn out the Army of the Cumberland facing Missionary Ridge, had connected with Sherman, but had had no fighting other than skirmishing varied by some artillery practice. Hooker had carried Lookout Mountain after a fight which has been celebrated in song as "The battle above the clouds." This victory of Hooker's compelled Bragg to withdraw his troops from the Chattanooga Valley, and retreat or concentrate for a battle on Missionary Ridge. On the morning of the second day Hooker was ordered by Thomas to march for and *carry* the Rossville Gap in Missionary Ridge, and as soon as that was done to send an aide or courier to him, in order that he might then make the assault of the "Ridge" with the Army of the Cumberland. Sherman with severe fighting continued his efforts to reach the crest of Missionary Ridge. As the day wore on, and without news from Hooker, Thomas became anxious, but could give no order to assault the works on his front till one at least of the enemy's flanks had been turned.

Finally, in the afternoon General Grant sent orders directly to the division commanders of the Army of the Cumberland to move forward and carry the rifle-pits in their front at the base of Missionary Ridge. This was very easily done, and after capturing the rifle-pits the soldiers, seeing that they could not remain there under the fire from the crest of the ridge, and having no intention of giving up any ground won by them, demanded to be led up the hill to storm the works on the crest, which was successfully done, and Bragg's headquarters were in their possession just before the sun went down on the second day of the battle. This assault was, of course, the crisis of the whole battle, and the successful carrying of Missionary Ridge was doubtless due in a measure to the position of Sherman and the threatening movement of Hooker.

The battle was then ended and nothing left but a retreat by one and a pursuit by the other opposing general. A condensed statement of the history of the original plan and the battle of Chattanooga as fought is this: The original plan contemplated the turning of Bragg's right flank, which *was not done*. The secondary plan of Thomas looked toward following up the success of Hooker at Lookout Mountain by turning the left flank of Bragg, and then an attack by Thomas along his entire front. The Rossville Gap was not carried in time to be of more than secondary importance in the battle.

The assault on the center before either flank was turned was never seriously contemplated, and was done without plan, without orders, and as above stated.

General Grant won a great victory at Chattanooga which was of incalculable benefit to the country, and it is worse than useless to attempt to cover his reputation with pinchbeck by such statements as "Few battles in any war have ever been fought so strictly according to the plan," "It still remains that this battle was fought as nearly according to the plans laid down in advance as any recorded in the schools," and "This battle more

closely resembled those of European commanders and European fields than any other great engagement of the American war"; for, like plaster ornaments on a fine façade, they are easily knocked off, and are liable to mar the real beauty of the front in their fall.

There were, however, during our great war some battles which, so far as my information and knowledge go, were fought strictly in accordance with the original plans, and these should not have escaped the notice of one who desires to write history.

JUNE 1, 1885.

Wm. Farrar Smith.

TRANSFORMATION.

"GIVE me the wine of happiness," I cried,
 "The bread of life!—Oh ye benign, unknown,
 Immortal powers!—I crave them for my own,
 I am athirst, I will not be denied
 Though Hell were up in arms!"—No sound replied,
 But turning back to my rude board and lone,
 My soul, confounded, there beheld—a stone,
 Pale water in a shallow cup beside!
 With gushing tears, in utter hopelessness,
 I stood and gazed. Then rose a voice that spoke,—
 "God gave this, too, and what He gives will bless!"
 And 'neath the hands that trembling took and broke,
 Lo, truly a sweet miracle divine,
 The stone turned bread, the water ruby wine!

Stuart Sterne.

THE CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE.

ONE hears of the Chautauqua Literary and Scientific Circle in all sorts of unexpected places. What is it? Can an old hack, used to condensation, tell in twenty-five hundred words? Let us try.

1. It is based on a plan of home-reading in regular system. At this moment it consists of about one hundred thousand readers, more or less, who are reading in the system proposed. Most of these are in America, some are in Japan, and the rest are elsewhere, in Europe, Asia, Africa, the islands of the ocean, or tossed upon the sea in ships.

2. The reading is selected and arranged for men and women, not boys and girls. The average age of the readers in the Circle is probably above thirty-five years.

3. The course of reading is in the English language.

4. It is arranged for four years,—supposing

at the least, say, five hours' reading a week. But it is so elastic, above this minimum, that a member of the Circle receives instructions and suggestions for a much wider range; and in fact, I think, most members read much more than five hours a week within the broad directions of the course.

5. It follows, to a certain extent, the outlines of an old-fashioned college course, omitting the mathematics entirely. Where it is followed with the supplementary reading, it gives a student much such a general knowledge of literature, physical and moral science, and mental philosophy, as in an old-fashioned college the average student received. But it makes no attempt to give the knowledge of ancient or foreign languages which here receives, or that of mathematics.

At this point the professors in old-fashioned colleges hold up their hands in holy horror,

give the magazine to the poor, and go out to make original researches on the Pro-parox-ytone. Let them. You and I, dear reader, will advance calmly and make some calculations.

The college student spends half his time at lectures or in the recitation-room. The reader in the C. L. S. C. cannot spend any of his time so. The average college student spends half his time in study of Greek, Latin, French, German, Italian, Spanish, or Hebrew. The reader in the C. L. S. C. cannot study either of these languages, in its course. Of the remaining time of study, the average college student gives, say, one-third to mathematics. There are no mathematics in the Chautauquan course.

Now, suppose the average college student takes forty-eight hours a week for study, lectures, and recitations. One-half of this, in study, will be twenty-four hours; one-half of this, on languages, will be twelve hours. Deduct one-third of the remaining twelve hours for mathematics, and you leave him eight hours a week's reading of literature, physical and moral science, mental philosophy, and social economy. It is in these studies only that "Chautauqua" undertakes to lead its circle of readers. Those readers who take ten hours only a week pass the average of study of the average college student in those lines.

The Chautauquan student reads when he can, where he can. He works without the advantages of the presence of a teacher, and without its disadvantages. He works without the advantages of studying two or three languages at once, and without the disadvantages.

He forms the habit of daily reading on system,—the habit which probably does more for the happiness of the man who forms it than any other indoor habit which could be formed. Fortunately, too, he can read outdoors, very often.

Of the hundred thousand readers in the "Circle," also, every one is reading because he wants to. This is much more than I could say of my average college students, regarding whom, indeed, I have now nothing more to say.

It will, of course, happen that if in any neighborhood several people are reading at one time in the system of the "Circle," they will find each other out, they will meet together, in more or less form, as a local circle, for mutual help, or for the pleasure or stimulus of society. When you see in your local newspaper the announcement of a "Chautauqua meeting," it is probably that of some such local circle. But there is no need of a "local circle." There is many a "Chautauquan" who reads quite alone, with no other knowledge of other Chautauquans than he gains from the monthly journal in which he receives his in-

structions. But, undoubtedly, the spirit of the local circles helps forward the interest of the readers, and is a good feature of the plan. It is a very good thing to have the best people of the same village all interested in the same thing in some one winter, and to have that same thing something better than personal politics. To have young men and women, old men and old ladies, middle-aged men and middle-aged wives of theirs, interested at one and the same time in Browning's poems, hunting up the things alluded to, guessing the conundrums, puzzling over the suggestions, and wondering at the mysteries,—this is a great improvement on leaving them to wonder why the Simpkinses shut up their house and did not leave Mary Morgan in it, as they did last year.

It is very interesting to see, when you give the diplomas to those who have gone through the course, how they really represent "all sorts and conditions of men." Of a class of twelve or fifteen hundred, who have been reading for four years, I gave the certificates of study to about one hundred. Twice, in this company, I came on a father and daughter who had studied together. Many of them were men and women older than I am; that is to say, born before General Grant was born. The whole class has representatives in almost every State, and would include people of almost every occupation. All that it needs to belong is the disposition, a decent preliminary common-school education, eight dollars a year for books and fees, and the command of five hours a week, or more, of one's time. This is to say, in general, that the course is open to any one.

It is ten years since the great series of plans for public education known as the "Chautauquan plans" were fairly started. Many men, of many minds, have contributed suggestions which have been embodied in them.

But it is always to be remembered that the founder of the Chautauqua Summer Meetings was Mr. Lewis Miller, of Akron, Ohio, a distinguished inventor, for years devoted to the cause of popular education. He saw the possibility of making use of the admirable machinery which had given dignity to the old Camp-Meeting of America, so that on the beautiful camp-meeting ground at Chautauqua a summer school for Sunday-school workers, with lectures on every variety of useful learning, might be established. For ten years and more these summer schools, with lectures and entertainments almost innumerable, have been carried on at that charming watering-place. These have been under the charge of the Rev. Dr. John H. Vincent, who is the originator of the C. L. S. C., a man of marvelous power of organization, and, best of

all, of hearty sympathy with the American people, a people whom he understands, perhaps, as well as any living man. Neither Mr. Miller nor Dr. Vincent, nor any of the friends who worked with them, was satisfied even with the large constituency which meets once a year at Chautauqua. They saw that it was possible to use the post-office and the press, to carry to every home no small part of the advantages which young people receive who go from home to college. Out of this possibility have grown the varied plans known as the Chautauquan plans.

Of course, when they began, the difficulty of selecting books for such study at home was very great. There is a good story told of the amazement felt by Harper Brothers when they received from this unknown "Circle" its order for five hundred copies of Green's "History of England." Harpers and all other publishers have found out long ago what a purchase for "Chautauqua" means. But Green's History, admirable as it is, is not a good text-book, or foundation history, for other reading to start from; it presupposes a great deal. If you will think of it, when a young man comes to you for advice about his reading you often puzzle him sadly. You say, "I should tell you to read X's book, but that, on the whole, X was a fool, and half of what he says is untrue." This is the sort of opinion, somewhat discouraging, which a trained scholar is apt to give. He does not know, perhaps, how very discouraging it is to the neophyte.

Chautauqua has had years upon years in which to study the advice it shall give a hundred thousand of such students. It has its own successes and its own mistakes to profit by. In many instances the board of management have found it necessary to have their own books written. To name only three or four, and this because I happen to have read them, Dr. Wilkinson's hand-books of "Latin and Greek Literature," Dr. Steele's book of "Political Economy," and Mr. Appleton's "Chemistry" are admirably well written, and fill the purpose singularly well. We do not doubt that, among so many readers, some find them too full and some too scanty. But readers or critics must remember that the object is to provide a stem-root, or if you please foundation, for other more extensive readings, and that suggestions or instructions for such extensive reading are given carefully and steadily.

All readers are invited to address the Central Staff, when they have inquiries to make or doubts to solve. For the answers given to such requests, the monthly journal called "The Chautauquan" is published. So many of the readers use it, that its circulation in America alone is at this time fifty thousand copies,

while there is considerable circulation in all other parts of the world. A department of this journal is devoted distinctly to the needs of the "Circle." Some of the required books, when written expressly for it, have been first published in the "Chautauquan"; and any reader who writes for information to the C. L. S. C. office at Plainfield, N. J., receives his answer here.

Thus much for the theory of the Circle. How does it work in practice?

The answer must be somewhat indefinite. But it is clear that the plan is popular. The number of readers who reported at headquarters for the class of 1881-1885 was about 5000. The next year 14,000 reported, the next year 18,000, and last year 20,000. This year the number is likely to rise to 25,000. All these people register their names at Plainfield, N. J., where is the central office. Of course, however, there are many readers who join local circles, and work with them, who do not register at the center. They do not mean to keep on, or they do not care for the diploma, or they are afraid to seem to pledge themselves to anything.

Of those who do register at the beginning, about one-quarter part report, at the end of four years, as having read the whole course. Very many of these read much more than the required minimum. A formal diploma is given to all who attain this minimum and ask for it, and diplomas with certain additional seals are given to those who read more. Fourteen hundred and seventy diplomas were given in 1884 to the class which had begun in 1880. If the student wishes, this diploma is sent him by mail. But a custom has grown up of giving diplomas at the "assemblies" held in different States for summer study, of which that at Chautauqua is the oldest, the largest, the longest in time, and the most fully organized. There are fifteen, in all, of these local summer "assemblies," and it is the effort of the management to be represented by one or more officers at each of them. "Recognition Day," at such an assembly, becomes a sort of commencement for those "Chautauquans" who meet there.

At Chautauqua, New York, on the 19th of August, I was present at the "Recognition Day," and delivered an address to the "graduates," who had kindly called me an honorary member. I personally gave their diplomas to a hundred of the class, and, in a visit of four or five days, I think I talked with half of them. So I can say that people read from one or another motive, but almost always with the idea of reading more. Old college graduates, professional men, read. Teachers read. Fathers and mothers read, when they begin to see

how they may need what they read to help their children. People read aloud in families, occupying an hour or two every evening with reading. Take, in a word, two or three dozen of the most intelligent people, of all ages and occupations, whom you find in any well-organized and well-educated American town, and you will form a good idea of the average Chautauquan readers as we see them on "Recognition Day." Of course, on such a day, you do not see the three-quarters of the readers who begin and never finish, or who finish this course, and do not care to ask for a diploma.

What you find, almost universally, among those who read four years, is a disposition to go farther. It is mostly to meet their wishes

that "Chautauqua" has set on foot other plans, of which I shall write next month. There are also adjunct schools or classes, which I shall try to describe at the same time. Thus I shall explain the plan of

The School of Theology,
The School of Liberal Arts,
The Town and Country Club,
The Society of Fine Arts,
The Assemblies.

And in general the Chautauqua University, which is the incorporated body that has the oversight of all these institutions.

But I have already nearly reached my twenty-five hundred words — as an impatient reader sees.

Edward Everett Hale.

TOPICS OF THE TIME.

The Outlook for Civil-Service Reform.

THE principles of civil-service reform are now undergoing the severest test that could be applied to them — a change of parties in the administration of the general government. Such a change after any former presidential election in the last quarter of a century would have been followed by a general and indiscriminate change of the public servants. To show what has been gained, the present condition and prospects of the civil service must be compared, not with an ideally perfect state of things, but with that which would have existed had neither the law nor public opinion placed any restraint upon partisan proscription. That not only those civil servants who are protected by the letter of the civil-service law, but a large share of those who are not within its beneficent protection, are left undisturbed in their places, is a fact which marks a great advance in public opinion and in the practice of the Government. Though many things are being done which fall far short of the highest ideal of civil-service reform, though many changes are being made in the public service which are not in the public interest, but are dictated by the old sordid spirit of partisanship, the fact remains that the cause of reform has made great and substantial progress.

The difficulties of the situation must not be lost sight of. For twenty-four years the offices of every grade had been filled, with few exceptions, by the adherents of one political party. A feeble and halting attempt at reforming the abuses in appointments, forced upon the party by public opinion during General Grant's presidency, was discarded with jeers and contempt at the first sign of the decay of public interest in the experiment. No further effort to check these abuses was made until an overwhelming popular demand for reform compelled the passage of the Civil-Service Act of 1883. When the new Administration came into power this act had been in force but a little more than a year and a half — a period too short to enable it to effect any appreciable change in the partisan character of the public service. The vic-

torious party, on taking possession of the government, found the public service almost solidly partisan; it found nearly all the chief public offices in the possession of men upon whom they had been bestowed as the rewards of partisan service, and who had not scrupled to use the power and patronage of their places in the interest of their party; and it found that the outgoing party, in its greed of patronage, had confined the operation of the Civil-Service Act within the narrowest possible limits. It found, moreover, that throughout the public service the prevalence of the notion that office-holders were the servants of a party rather than of the people, and the bestowal of places as the reward for partisan service or at the dictation of influential politicians, had impaired the efficiency and energy of the public servants, had swelled the number of tax-consumers, and had greatly increased the cost of carrying on the government.

In these circumstances changes in the public officers were inevitable. It could not be expected that a party flushed with victory, coming into power after an exclusion of a quarter of a century, would take this solidly partisan service off the hands of its predecessor, and trust only to casual vacancies to find places for its own adherents. Had the public service been administered for even the last ten years in a non-partisan spirit, had the doors of office been thrown open to all citizens without regard to their party beliefs, and had the higher places been filled by the impartial advancement of meritorious subordinates, any change in the public servants, except for misconduct or inefficiency, would have been censurable, if not criminal. But this happy condition of things did not exist, and it would have puzzled the most radical civil-service reformer, called upon to administer the government chiefly by the votes of members of the party so long excluded from office, to satisfy the requirements of the situation without making some changes in the *personnel* of the service. It certainly does not lie in the mouths of those who have so long enforced the most rigid partisan proscription to cry out against partisan changes, nor does it seem quite logical for those who have

gained and long held office by virtue of this proscriptive system to urge their length of service as a reason why they should be permitted to keep their places. Civil-service reform would, of course, consider only the efficiency of the public servants, but practical administration cannot blink the fact that the chance to acquire that efficiency has been denied to half the people, and to that half, too, which has just come into control of the government.

President Cleveland was very generally voted for by the advocates of civil-service reform, but it must not be overlooked that he is primarily a Democrat, nominated by a Democratic convention, and elected chiefly by Democratic votes. How to reconcile his duty to the great party whose views and purposes he represents with his well-known and, as we believe, perfectly sincere views concerning the public service, is the problem which he is daily called upon to face, and it is a problem whose right solution calls for all his firmness of character and fidelity to principle. But, although changes in the public servants are inevitable, and even necessary in order to bring about a fair representation of both parties in the public offices, it does not follow that the changes are being confined within proper limits or made with due regard to the public interests. There was one straightforward, business-like way in which a fair proportion of changes could have been made without detriment to the public service, in many cases with positive advantage to it. While a majority of the public servants are honest, capable, and efficient, the selfish, slipshod methods of appointment which have prevailed for many years have foisted into official places many who are idle or incompetent, and some who are disreputable or of bad habits. An intelligent, systematic investigation would have disclosed these weak places, and they might readily have been strengthened with new material of the right sort with benefit to the service. So far as we can learn no such investigation has been made. The President, in the appointments and removals which he has personally made, seems to have acted only after the most thorough inquiry that the agencies at his command enabled him to make, but it does not appear that all of his newly appointed subordinates have pursued the same wise policy.

The result is that there is the widest diversity between the action of the different departments and even of different branches of the same department. In one case an important place is filled by the promotion of a meritorious subordinate, or the appointment of a new man of acknowledged fitness; in another the appointment is bestowed upon a brawling politician. In one bureau all of the faithful subordinates are retained; in another nearly all those without the protection of the civil-service rules are dismissed or degraded, and replaced with inexperienced men. While officers of acknowledged fitness are being turned out of one branch of a department, men of notorious unfitness are retained in places of trust and confidence in another. One new officer declares that he cannot transact the public business unless he is permitted to surround himself with men of his own political faith in whom he has confidence; another threatens to throw up his place if deprived of the services of the trained and faithful subordinates whom he found in office. Facts so incongruous and irreconcilable as these make it very difficult

to pass any general judgment upon the treatment of the civil service by the new Administration. The most that can be said is that the President shows a sincere purpose to elevate the public service; that the letter of the civil-service law is in the main respected; that the spirit of the act has been followed in the filling of many important offices, and in the retention of a large proportion of the officers not protected by its letter; and that, on the whole, the situation is much better than could have been looked for after a change of parties in the national government.

But we greatly doubt whether a man whose convictions are so sound and strong as those of Mr. Cleveland will be content to let so tame a conclusion as this stand as the final judgment upon the treatment by his Administration of the great, vital question of civil-service reform. We doubt whether he will be willing to surrender many more months of his own time and of the time of his chief advisers and assistants to the demands of office-seekers, or to have the civil service kept in a state of perpetual uneasiness and unfitness for serious work by the fear of arbitrary changes for partisan ends. It would be quite consistent with his character and convictions if he should before long revolt against such a degradation of his high office. It is plain that the process of equalizing the offices between the two parties must soon come to an end if the Administration is to find time for any other work than that of distributing the patronage. It would be a most courageous and patriotic act if the President should, after a little, announce that the changes in the offices had gone as far as the public interests would warrant, and should erect a barrier against further removals by bringing within the operation of the civil-service rules a large share of the minor places that are now unprotected. Such a declaration would be hailed with rejoicing by patriotic citizens of every shade of politics.

Converging Lines.

THE questions raised at the late Congress of Churches are stirring devout minds in all parts of the American church. The sin and the scandal of schism, the need and the practicability of a more effective co-operation among the professed disciples of Christ, are forcing themselves upon the consideration of good men as they never have done before. That the peculiarities by which the several sects are distinguished one from another are matters of considerable interest to many minds may be freely admitted; that they are of trifling importance when compared with the great truths in which all Christians agree, and the great ends which they are united in pursuing, is too plain for discussion. When, therefore, the denominational peculiarities are so emphasized that the luster of the great truths is dimmed, and the progress of the kingdom of heaven in any community is retarded, the guilt of schism is incurred, and a heavy condemnation rests on those who thus magnify their "private interpretations" at the expense of common interests. This is now being generally recognized; and men of goodwill in all the sects are manifesting a strong determination to put an end to this iniquity. The Congress of Churches has taken a brave step in this direction by providing for a frank discussion of those differences of creed and ritual on which the denominations sep-

arate. No better method could be devised of showing the world the relative insignificance of these differences. When this fact is made to appear, the path to practical coöperation, if not to organic union, will be made plain.

In the same line with the purpose of the Congress of Churches is a striking article by an eminent clergyman of the Presbyterian Church in the present number of *THE CENTURY*. The historical breadth and the pacific temper of this paper will commend it to all tolerant and charitable persons. That the doctrinal differences among Christians are much less strongly accentuated now than formerly is a familiar fact; that they are approximating to common grounds of polity and ritual, as Professor Shields so clearly points out, is equally true. It would be a most useful exercise for clergymen of the several denominations to make a careful study of the symbols and the institutions of their several sects, in order to discover and make known the indebtedness of each to the others, that the people of every communion may know whence they derived the creeds which they recite, the doctrinal and liturgical expressions by which they convey their thoughts and feelings, the forms they observe, the principles they cherish, the hymns they sing. Such knowledge could but enlarge the sympathies of Christian believers and strengthen the bonds that unite them.

That the churches of the United States will find "liturgical fusion" a shorter road to unity than theological agreement, or political consolidation, may well be true. Surely a devotional fellowship would be deeper and more permanent than a doctrinal consensus or an ecclesiastical combination. But it may be doubted whether this result is quite as near as Professor Shields seems to hope. That there is a tendency among non-liturgical worshipers, chiefly among the Presbyterians and Congregationalists, toward the adoption of liturgical forms, is undoubtedly true; but even in these churches, the number is yet small, we imagine, of those who would consent to a fixed ritual, from which extemporaneous worship should be excluded. Doubt-

less the utterance that springs from the "chance impulse" of the officiating clergyman often fails to be edifying, and "unpremeditated effusions" and "long desultory prayers" are sometimes hard to endure; but the great majority of those who favor some enrichment of the meager ritual of the Puritan churches yet prefer that the leader of their worship shall have some liberty of expression; and while they would not wish that his prayers should be desultory or unpremeditated, they desire that he should be in closest sympathy with those to whom he ministers, and that he should be able to utter the voice of their present need when he leads them in worship. So much as this of priestly function the Protestants have always yielded to their ministers, and they are not yet ready to take it away from them. Probably Professor Shields does not desire such a complete change; at any rate, such a change is yet a great way off. The union of the churches of the United States upon a uniform ritual,—if the extemporaneous element were to be rigidly excluded,—could not, we think, be confidently predicted.

Every essay in this direction is, however, of value; and this suggestion of the fellowship of believers in that part of their religious life which is most distinctly spiritual—in their confessions, their prayers, and their songs—is one that may lead the way toward a visible and real unity.

Professor Shields's paper, so catholic in its view and so full of sweet reasonableness, will be followed by a number of others, prepared by representative men of several of the leading denominations, each of whom will undertake to show what contribution those who stand with him are ready to make toward the accomplishment of this end. It is assumed on all sides that a closer unity and a more perfect coöperation among the churches is greatly to be desired; it is obvious also that some concessions, and perhaps some sacrifices, must be made by each for the good of all. *THE CENTURY* has offered to wise leaders in these various sects the opportunity of pointing out the ways that lead to concord and coöperation.

OPEN LETTERS.

An Exposition of the Three Americas.

ON the principles of persistence of force and continuity of motion, the best results of a great work cannot be computed until after the first impressions produced by it on the environment have disappeared; sufficient time has therefore not yet elapsed since the close of the World's Exposition for a thorough estimate of its beneficent effects upon the country at large and the South in particular. Forces were set in motion last winter at New Orleans that are but now making themselves felt, and that will eventually prove of incalculable value to the development of a firmer industrial life and a higher national sentiment. The Exposition was inaugurated at a time when the tide of Southern affairs had begun to turn, and was the expression of a strong desire on the part of Southerners to assert their industrial equality with

the other sections of the country, and to offer irrefutable evidence that they were full of peace and goodwill toward their fellow-citizens of the North, and had completely adapted themselves to the changed necessities of the times. Assuredly, no one who visited New Orleans when the Exposition was at its height could fail to see that these desires had been largely fulfilled. Even Southerners themselves were astonished at the marvelous resources displayed by their own States,—resources only partially unfolded, it is true, as compared to the higher development of other parts of the country, but nevertheless filled with startling promises of a brilliant future. And still more assuredly no one could fail to be impressed with the unequivocal public and private hospitality received by every well-conducted stranger. The welcome was too warm to admit of any doubt that it was sincere, or that there lay behind it any latent feeling of injury

and vindictiveness. Indeed, it would not be difficult to prove that the recent expressions of honest regret from all classes of Southerners at the death of the great American hero were partly attributable to the cordial relations established by the late industrial festival in the metropolis of the South. Whatever its deficiencies and its financial failures, the World's Exposition will soon be recognized by all students of contemporaneous history as one of the most important features of this decade.

But the people of New Orleans have undertaken a work of still vaster proportions, a work made all the more necessary by the success of their recent labors. The last exposition was supposed to be international in its scope, but its primary and chief object was the development of Southern industry, by bringing it into close contact and rivalry with that of the other portions of the globe. Although every State and Territory in the Union, with the exception of Utah, was represented by a handsome collective exhibit of its natural resources, the enterprise was essentially Southern. But the work now going on is international in every sense, and is of as vital importance to the North and East and West as it can be to the South; for on the 10th of November there will open at New Orleans a North, Central, and South American Exposition, which has for its object the solution of the industrial problem of the United States. It has long been a serious question with manufacturers to know what shall be done in the future with their surplus products. There has been such enormous increase of manufactures of every character throughout the North and the East during the past few years, that it only required ordinary intelligence to foresee a time of great over-production and consequent distress. Up to the present moment the South has been the market for this over-supply; but the World's Exposition has so stimulated her industry and so developed her natural wealth, that she is preparing not only to sustain herself with her own resources and by her own labor, but to compete with Northern products upon Northern soil. The unsuspected mineral deposits in such States as Louisiana and Texas, heretofore supposed to be fit only for agricultural purposes, the cheapness with which iron can be made in Alabama, the profits from cotton manufactories in South Carolina and Georgia, all point to a period when the South will also be in need of an outlet for her enterprise. This period in her future is comparatively distant, but such a time is pressing irresistibly upon the more populous and cultivated portions of the country; and it is for this reason that the American Exposition concerns the entire United States. There is no such bond as community of interest; what the World's Exposition failed to do in removing sectional prejudices, will be accomplished by its successor and complement.

There is but one direction in which the necessary relief from this inevitable over-supply can be found, and that is in the countries of Central and South America. It is needless to look towards Europe. She has come to that crisis in her industrial life which the American Exposition is seeking to obviate in our own, and has already reached out and appropriated the richest parts of the Latin-American commerce. The deflection of this Central and South American trade from Europe to the United States is the highest

international problem with which our country has at present to deal; and nothing will tend to solve it sooner than the Exposition at New Orleans, where a hemispherical commercial policy can be inaugurated.

As to the benefits to be derived from such a policy, even were it not of pressing necessity, a few statistics will not be uninteresting. According to recent reports by the Department of State, there is a total annual demand from Mexico, Central America, South America, and the West India Islands, amounting in round figures to \$475,000,000, of which amount the United States supplies but \$77,000,000, or only sixteen per cent. Again, while the total annual exports of these countries amount to \$479,000,000, the United States takes but \$168,000,000, or only thirty-five per cent. In other words, the interchange of products is not between the countries of Central and South America and the United States, as it should be by all reasonable laws, but is between those countries and Europe. These figures will probably astonish those who have not studied the latest currents of commerce, and will surely be humiliating to our sensitive national pride. To deflect from Europe this ever-increasing trade, and to establish reciprocal commercial relations, is the primary and patriotic purpose of the Exposition.

That New Orleans is the place where such a movement should be started is not to be questioned. The recent decision of the Post-Office Department that hereafter all United States mail for the Central American countries should be sent by way of New Orleans instead of New York, as formerly, indicates the growing sentiment in favor of New Orleans as the medium for this commercial interchange. Until recently, it was doubted whether the Crescent City was in a position to handle the expected trade; but her steadily advancing prosperity during the recent financial embarrassments, affecting the whole world, shows conclusively the solid grounds upon which her fortune rests.

It is fitting that New Orleans should be the promoter of this international enterprise for the additional reason that it was through the World's Exposition that the general public became aware of the great resources of Mexico and Central America, and the advantages inevitably to follow a close commercial reciprocity. Every one had of course read the tales of travelers, and had learned to speak of the wondrous wealth of Mexican mines and South American forests in much the same way as they spoke of the magnificence of Oriental princes, vaguely and somewhat incredulously. But the World's Exposition gave unmistakable evidence of these and many other extraordinary natural resources. Indeed, it was the immediate success of Mexico's exhibit that has stimulated the other Latin-American countries to take advantage of the opportunities presented by the new enterprise.

The management of the American Exposition is national in its organization and is working for the prosperity of the entire country. It purchased the plant of the late World's Exposition, and will open its doors on the 10th of November, unembarrassed in any way whatever. With steam transportation from the heart of the city to the exposition grounds, and with unprecedentedly low railroad rates, there is every assurance of success. The management has set aside

for the discussion of the great commercial problem certain days when leading minds of the three Americas will meet for an interchange of ideas, and give to the industrial life of this country an impetus as irresistible as the mighty river upon whose banks they deliberate.

NEW ORLEANS.

Richard Nixon.

**Reform of the Civil Service
Essential to every other Reform.**

DOES it not every day become more evident that reform of the civil service is essential to the success of many other important reforms? Take, for example, the matter of forest protection. In the State of New York, by dint of much hard work and the expenditure of a good deal of time and money in investigation, an act for the preservation of the Adirondack forests and other important tracts of woodland was got through the last Legislature. Had the majority of the members of that body been as intelligent and honest as those that civil-service reform will doubtless one day give us, it is probable that a much better act would have been passed a year earlier. At that time we had, thanks to the uprising of the reform sentiment, a Governor who would no doubt have promptly made fit appointments under the law. Does any one suppose that if his successor had been a man of like mind he would have made the appointments he has, which have had the effect to delay the operation of the law an entire season, even if no worse comes of it?

Is not the same principle illustrated in our attempts to restrain gambling, the sale of intoxicating drinks on Sunday and to minors, to suppress obscene literature, to protect immigrants, Indians, children, and animals from injustice and cruelty? Of what avail is the adaptiveness of a law, in itself considered, to secure any of these desirable objects, unless it is executed? And how can it be executed except by public officials who are either appointed or elected? But what hope does either reason or experience give us that, when public office is the reward of political service, we shall have such enforcement of law by constables, excise commissioners, sheriffs, policemen, police justices, district attorneys, etc., as will — by offending powerful constituents who have an immense pecuniary interest in the non-enforcement of such laws — put their own reelection or reappointment in jeopardy? Has it not come to be regarded as a matter of course that local officials will not enforce certain laws in certain localities?

Now, why cannot our reformers of all sorts see this, and unite their efforts first of all upon the one fundamental reform — that of the civil service? Take our self-denying and public-spirited friends, the Prohibitionists. They tell us that if liquor-selling is not stopped in the large towns of Iowa and Maine, it is because the public officers are not heartily in favor of stopping it. They maintain that these officers can execute the law so as to make it impossible — or at least very difficult — to get liquor to drink; and they are confident that, were this done for a few years, the decrease in crime and pauperism would bring so many who are now upon the fence over to the prohibition side, that there would afterwards be no difficulty in keeping the necessary laws upon the statute-book and in enforcing them.

Granting all this, does it not prove that the first thing for prohibitionists to do is to help secure trustworthy national, State, and municipal civil service? Until this point is reached may it not really injure the cause to agitate for absolute prohibition over whole States? Local option may, indeed, give real prohibition in counties or towns where public sentiment demands and will sustain it. But until the general quality of our public servants is higher, is there not at least a very strong probability that, when applied indiscriminately to large areas such as States, there will be at the outset such failure in cities, — where the percentage of foreign-born population is large, — that a perhaps undeserved discredit will be brought upon the principle of prohibition?

Most plain, common-sense people are shocked at seeing a statute ignored, as are most laws restraining popular vices in our large cities. The average man believes that when a law is not executed it is a strong presumptive proof that the principle of the law is wrong, or at least that its enactment is premature. Why, then, can we not all unite, first and foremost, in efforts to bring the civil service into such a condition that a law, when enacted, shall be so enforced as to furnish a real test of its merits?

S. W. Powell.

A Word for our Public School Teachers.

I WISH to introduce to thoughtful readers a class of workers seemingly forgotten in the dispensing of moneys for the founding and support of various retreats, homes, and hospitals.

The friendless sailor, who, through misfortune, thriftlessness, or casualty, has not saved a competence to support him in his weakness or old age, has his "Snug Harbor" for refuge from an unloving world; the clergyman, in case of worn-out faculties, has the Sustentation Fund of his denomination, meager though it may be, to count upon; but the public school teacher, in many cases after years of faithful public service, has to choose between two alternatives: to remain in the harness until literally turned out to die, or look forward to dependence upon the charities of friends or of the people.

I do not propose the endowment of a special refuge for such unfortunate ones, for, as a general rule, teachers are self-respecting, independent, and possess the kind of pride which instinctively shrinks from publishing their poverty. But it is true that many, in this broad land, who have conscientiously served an exacting public for a mere pecuniary pittance, find themselves, after a score or more years of such service, weakening physically, and perhaps mentally, with only such a sad prospect before them, as they look toward life's sunset.

I see only two ways of relief for this crying injustice: One, to educate the general public to the fact that the laborer is not only worthy of hire sufficient for his daily bread, but something over, to lay in store for a time of disaster and need.

The other appears to me the more feasible plan: Honorably to retire from active service, with a moderate competence, those who have faithfully discharged their duties for a fixed term of years. Why should we not

have a retired list of public school teachers as well as of army and navy officers?

Have not some of our honored legislators remembrances of faithful teachers who patiently and wisely set their feet in the upward path to success, and whose memories they would delight to honor by giving their voices in favor of such a movement? Surely it would be an onward step for our law-makers to place upon the statute-books of their respective States some law for the respectable support of this large class of necessary public servants.

A Plea for Reality in Plays.

It is an open secret that during the last two seasons the managers of our theaters have, with but very few exceptions, found their business unprofitable. They attribute the loss of patronage to a decline of interest in the drama, to the invasion of foreign "stars" who became the rage for a brief period, to hard times, and to the increase of skating-rinks and dime museums. Now, while each of these causes may have had some effect, not even all of them together will account for the extreme depression in theatrical business. The truth appears to be that nearly all our managers ran in the same grooves that they had been in for years. They offered to the public the same kind of theatrical food that they offered a decade ago, only that the quality is not so good; and they were surprised that the public palate rejected it, being nauseated with so prolonged a succession of highly-spiced ingredients. Nearly every manager is to-day looking and hoping for another piece like "The Two Orphans" or "A Celebrated Case"; but if an equally good play of that class could be found, it would not possess the same attractiveness as its predecessors.

The drama of mere incident is moribund, and if a revival should ever come, it will be when there is an entirely new generation of play-goers to whom the tricks of the constructors of melodramas will not be familiar. Our audiences are now so well versed in stage-methods that they can foresee the solution almost before the dramatist has stated his problem. The elements of surprise and novelty, once so alluring, can now no longer form a part of the audience's enjoyment. It seems as if every possible situation and combination of situations has been so thoroughly exploited, that no melodrama can be constructed which does not strongly recall another more or less ancient.

The revolt against the old style of drama is not confined to this country. Recently M. Dennery, who has probably written more and better melodramas than any other of the admittedly great playwrights, produced, in conjunction with M. Louis Davyl, a drama, entitled "L'Amour." It failed dismally; yet M. François Sarcey said it failed, not because it was not a strong and well-made play, but because it was cast in the same mold that Dennery has been using for thirty years, and the public is tired of its products. Dennery has seen several of his later plays fail, and the same bitterness was experienced by Scribe, who for technical skill and ingenuity has never been surpassed. When he witnessed the failure of his last play, he exclaimed sadly, "They will have no more of me; they know my methods and turn by heart, and I can give them nothing new."

American managers have not studied the artistic side

of their business. They have not watched the tendencies of the sister arts, painting and fictional literature, towards a closer truth to nature. The pre-Raphaelite movement in art is now so old, that its beginning is only remembered by the middle-aged, but its good effects remain while its extravagances have died. Conventional back-grounds have disappeared, and so, too, must go the conventional tricks of dramatic construction. In literature, the novel of mere incident is rapidly disappearing. Incidents are limited in kind and number, but every human individuality is distinct, and if well depicted always interesting. We want plays that shall exhibit living, breathing men and women, not the mere puppets of the dramatist, who act only as their creator wants them to act in order to bring about his situations.

Truth to nature is the fundamental principle of other arts, and the time has at last come when the public demands it shall also be the basis of plays. Théophile Gautier pointed out that the stage is always the last to adopt an idea, and usually after that idea had been worn almost threadbare in literature. This fact is easily explicable. Audiences are made up of people of only average intelligence. New ideas and new methods appeal, at first, only to the cultivated few, and the newly-born taste filters slowly through the masses. Careful pondering and meditation are possible to the reader; but not to the auditor in a theater who has scarcely time to grasp the sense of one phrase before another assails his ears. A new taste is not created in the theater, but outside; and very often is created insensibly to its possessor. He goes to see a play of a kind which formerly pleased him and he comes away dissatisfied. Very possibly he is unable to explain his dissatisfaction and does not know whence it arises. It springs from his improving taste, from the unconscious demand that scenes which purport to represent life shall be true and logical.

Our managers are in the habit of asserting that they give us the best plays that France and England produce. The assertion is not accurate. They give us the best of a certain class, but that class is far from the highest; only two Théâtre Français plays have been presented here in the last five years — "Daniel Rochat" and "Les Rantzeu." While the former was not a great pecuniary success, it drew to the Union Square Theater numbers of people who were not regular playgoers, and it did more to raise the character of the theater than any previous or subsequent production. "Les Rantzeu" owed its interest and success in Paris to Alsatian scenes and the employment of a dialect by some of its characters. For this country "Les Rantzeu" was an unwise selection and failed, but it was treated with respectful consideration by the press and the presentation increased rather than detracted from the standing of the theater. Émile Augier is recognized as the greatest of living dramatists, yet I believe only two of his plays have been done here, — "Le Gendre de M. Poirier" and "Les Fourchambault," — both presented under somewhat unfavorable circumstances. Our managers say that Augier's plays are too quiet or too good. I venture to think that the time has come when no play that is successful in any other country, on its merits as a dramatic work, and not on some special patriotic effect or allusions, is too good for the best theaters of New York, Boston, and our principal cities.

The people who are able and willing to pay a dollar and a half for a seat at a theater are the readers of George Eliot, Hardy, Howells, and James, not of Wilkie Collins, Miss Braddon, Rhoda Broughton, and Ouida. They demand that the characters, the dialogue, and the incidents of plays shall appear to be real. They would be willing, even anxious, to see their own passions, feelings, hopes, desires represented in others, but they have little or no interest in events the chronicles of which should belong to the police-reports. We are all daily living dramas and comedies not lacking in intensity or humor; yet how very few of us come into contact with murders, assassinations, abductions, hair-breadth escapes from fire and water, or are acquainted with rooms provided with half-a-dozen doors behind each of which a comedian may be hidden!

No other people is so fond of the study of character as the American. This is most strongly proved by the success here of star-plays which are tolerated solely because each possesses one or two parts which the public recognizes to be true. In this desire to see, not events but character influencing actions, the dramatist and the manager have a sure foundation to build on. Let the one write and the other produce a play with a fair story in which all the characters shall be recognizable as true and natural types, and one theater at least will not have to complain of poor patronage. Such a play will probably be devoid of what managers and actors term "strong situations" and at the end of each act the curtain will not descend upon large groups carefully posed and firmly fixed into attitudes, as if they were the personages in fairy stories touched by the enchanter's wand. It should be mentioned that Mr. Daly is the most original of our stage managers in devising "business" (action and movement upon the scene) and that all his later productions have tended strongly in the direction of naturalness; but he deals exclusively with light comedy, and the more serious side of our daily life remains to be treated.

The American stage is to-day almost in the same condition that the English was about twenty years ago when nearly every theater was given up to either melodrama or broad farce. Then came Tom Robertson's opportunity,—an opportunity he had been waiting for in poverty and anguish. "Society," "School," "Caste," "Ours," were surprises because they seemed unconventional, depicting life and character as his audiences knew them. The work was not always true, witness the impossible Froissart-quoting *Marquise* in "Caste" and the examination scene in "School"; but the plays were so much truer than anything ever seen before that they won immediate acceptance. The influence of Robertson's style was promptly felt. The modern theater, which had been neglected by the more intelligent classes, was again attended, and the Court, the St. James's, and even the Haymarket theater, produced his plays or as close imitations of them as were procurable.

It is singular that while our stage stands about where England's did when the Robertsonian drama arose, a type of play is being introduced into London, which has here had a long life and with which we are thoroughly sufficed. The French drama of unchastity which began with "Camille" and was continued through "Frou-Frou," "Fernande," "Seraphine," "La Princesse Georges," etc. etc., has been exhibited

here in every phase. In London it is almost new, because the censorship of the Lord Chamberlain has till recently prevented its production. That official has of late somewhat relaxed his restrictions; and only because of its novelty can the success of a play like "Impulse" be accounted for, it being an adaptation of one of the weakest specimens of its class.

Nothing urged herein must be construed as intimating that the appreciation of the works of the few great dramatists will decrease. On the contrary, their characters were drawn with such close observation and such marvelous intuition that they will be interesting so long as "the proper study of mankind is man." Nor is it probable that melodrama will die. It will most likely disappear for a while from our best theaters till the time when either a new generation of players grows up, to whom the methods of to-day will not be stale, or till new writers arise who will give us plays as much superior to the "Lights o' London" and "The Two Orphans" as they were to "Jack Sheppard" and "The Child-Stealer."

The only way to attract to new plays the audiences who now go to see only Salvini, Irving, Booth, Barrett, Modjeska and Bernhardt is to offer the drama of actuality—the drama that will conform to modes of life and thought and to present taste in literature and art. Managers who profess to be unable to find good plays of the old type could lose little in trying an experiment with the new. I firmly believe they would fill their depleted treasuries and render a lasting service not only to dramatic art but to audiences who would then have at their command the power Burns yearned for—

"To see ourself as ithers see us."

Julian Magnus.

Fire Prevention.

IT is reported on good authority that the people of the United States pay out every year one hundred and thirty millions of dollars, without any return whatever. Of this sum twenty millions is for supporting fire departments, thirty millions for sustaining fire insurance companies, and eighty millions for conflagrations. As a people we are said to enjoy looking at a good fire, and as a nation we have more of this particular style of show than any other people living.

There seems now to be a growing feeling among the people that something must be done to prevent this waste of life and property. The departments we must have; but we must have more. The evidence of this feeling is found in the invention and ready sale of new appliances for extinguishing fires, and in the formation of village fire-prevention associations.

The moment an alarm of fire is sent out in our cities the police appear in force and form a cordon about the fire to prevent the people from interfering with the firemen. This is quite proper and must always be done. At the same time it has done a vast deal of harm. It has rendered the mass of people indifferent to the art of putting out fires; it has made women and children and the majority of men unreasonably timid, and actually created a senseless dread of fire that on the slightest provocation is liable to turn to panic. If people were familiar with fires, if they understood

how long it takes for a fire to spread in one kind of building, and just how fast it travels in another, if they knew even the rudiments of the fireman's art, and above all, if they knew the value of time at a fire, there would be fewer fires and less danger of a panic. The fireman is not above all men cool and brave. He simply knows how fire behaves, and knowing this, he feels secure and keeps his wits about him in scenes that seem to the public, standing behind the policemen, full of terror. Moreover, the average citizen, thus shut out from all share in fire prevention, loses courage and at the sight of the merest blaze, instead of attempting to put it out and instead of lustily calling fire and urging other people to help him, runs away to turn in an alarm. In ninety cases out of a hundred if he had kept his wits about him he might have put the fire out. The fire-extinguisher may be near, but he has never learned to use it. There may be hand-grenades in reach, but his terror is so great that he wastes them. There may be water and even a hand-pump near, but he cannot use them.

This new sentiment in regard to fire prevention seems to offer three points of general interest. It has led to the invention of new methods of putting out fires; it has led to a partial return to the old volunteer fire departments by the formation of a new form of voluntary association for mutual protection, and, lastly and perhaps the most important of all, it is educational and seems likely to do much to remove the danger of panics.

First, of the associations. These new fire-prevention societies are formed of men and women, boys and girls, every one possessed of sufficient intelligence to carry a pail of water or call for help on discovering a fire. Each member on joining the association agrees to pay one dollar a year towards the expenses of the association and to lend a helping hand at any fire in reach, as far as his or her services are needed. The officers of the association serve without pay and consist of a president, secretary, and treasurer. These, with four or more members, form the board of directors. There are also two fire officers known as the foreman and assistant foreman, who have charge of the working members at a fire. There may also be a committee on insurance and a committee to report on the causes of fires. This is all that is required in the way of an organization. There need not be many meetings of the association, and these may be held in a private house or in a hall hired for the purpose, so that there are no expenses except for the actual work of extinguishing fires.

The equipment of such an association consists of fifty or more small hand-pumps and water-pails. These are distributed to such members as agree to keep them in easy reach and to take them to any fire within half a mile of their homes. There is also at some central station, preferably in a private stable, a supply wagon. This wagon is to stand ready at all times for duty, and arrangements are made for securing a horse for it at a moment's notice. In the wagon are five or more hand-pumps, hose in lengths for coupling together, poles for elevating the hose, a variety of nozzles, ladders, axes and other fire tools, rubber blankets for covering furniture, etc. There will also be several barrels or large milk-cans constantly filled with water in the wagon, and at various points in the town there will also be rain-water casks kept constantly full for the use of the association.

It will be seen that such an organization would be of little use at a conflagration. It is not intended to be so used, but merely to prevent conflagrations by the use of a little water at the very beginning. The association is educational and it accomplishes its ends by means of a novel and happy device for winning earnest workers at the very start of a fire. There is a system of rewards to all who discover a fire and all who first help to put it out. These prizes are given to any one, young or old, whether members of the association or not: for the person giving the first five calls of "fire" for a burning building, twenty-five cents; for the first stream, one dollar and fifty cents; for the next four, one dollar each. First assistant to first stream, with water, one dollar; next four, fifty cents each. First pump, with twenty-five feet of hose connected to arrive, twenty-five cents, first fifteen-foot ladder, twenty-five cents; first fifteen-foot pole or other fire tools, twenty-five cents each. For the first response with pump or bucket of water without using it, fifty cents each, and also to the next five persons bringing either pump or bucket. For grass, forest or other fires not in buildings a prize of seventy-five cents for the first person who extinguishes the fire by any means, and fifty cents each to the first five who arrive with pumps and buckets, and twenty-five cents each for the first five buckets without pumps. Owners, tenants, or employees are excluded from prizes, as it is supposed that their own interest will be sufficient incentive to exertion. Moreover, those who make any honest effort to put out a fire, whether they actually work or not, receive a prize. For instance, a child who discovered a fire and ran with a pump and bucket till she met a man who could use the pump, received a prize as well as the man. A boy who killed a grass fire with his hat received a reward. The first persons who assist in any way at a fire are rewarded by the association regardless of the means used, so that fifteen persons may win a prize of some kind at a single fire.

These associations are called home fire-protective associations. The first one was formed in November, 1882, in the town of Wakefield, Massachusetts, and has been in operation ever since. The reports of this pioneer association show that in 1883 there were nineteen fires in that town, and of these thirteen were put out or brought under control by the small hand-pumps and other appliances of the association. Three fires were put out by the regular fire department and three fires got beyond control, and the buildings were destroyed. The expenses of the association for the year were about one-half of one per cent. of the cost of the regular fire department of the town. In 1884 there were twenty-six fires in the town. All but three were put out by the hand-pumps of the association, and at every fire the prizes were taken by persons not belonging to the regular fire department. In other words, the fire-engines were the last to arrive every time.

The success of the Wakefield association has led to the formation of others in neighboring towns, and there seems no reason why they might not be started in every large town and village. They are not designed to supersede the fire departments, but to reduce the expense of such departments by reducing the number of fires. Their value is not alone in putting out small fires, but in their moral and educational aspect. It teaches peo-

ple to study fires and fire prevention, to keep cool and to see the value of the first efforts. A fire increases four times in a given time. If it is a foot square at one minute, it will be four feet square the next minute and sixteen feet square the next minute, and so on. If people go to a fire when it first begins they soon learn how easily it is put out, how little water it takes if rightly applied to stop it from spreading. All this tends to allay the unreasonable fear so many people display at a fire. No fire in an ordinary building will spread so fast that the inmates cannot escape in one direction or another. It is the running away from the first blaze that makes more than half the loss of life at fires. Anything that teaches people to go to the fire, to fight and not to run away, will be a public benefit, and this these associations accomplish by making every man, woman and child a helper at the critical moment when the fire is small. They inculcate courage and watchfulness, and show that in all emergencies coolness and self-possession are the only roads to safety. Best of all, they teach the incalculable value of time at every fire.

It seems to be a law in invention that a new tool, machine, or method of work appears about the time, or very soon after, the first announcement of a general desire that such a thing or method should be found. In this field of fire prevention four inventions have appeared within the past few years. One has been very widely adopted, one other has been used in one class of buildings, and should be used in more; and of the two others, one is quite new, and the other, while a very old idea, seems to have met with a new application.

The first of these is the common fire-extinguisher. It clearly met a want, and has had a very large sale. It is useful, and should be provided with the supply wagon of the home fire protective associations, but it has these objections. It is too heavy, and if neglected will sometimes get out of order. Besides this, its use implies a certain amount of knowledge. It might be said that every one should know how to use one, but unfortunately people generally do not know how. Some machines give no indication how they are to be used, and if the directions are marked upon them the excitement of a fire is not conducive to a calm study of the directions. It is a good fire tool in the hands of the trained fireman. If used by the home associations it should be placed in the care of strong men familiar with its use. It is doubtful if a fire-extinguisher would be of any use in the hand of a child, and yet children have won prizes at fires in Wakefield for effectively assisting at putting out the fire.

The next invention in point of time is the automatic sprinkler. Upwards of thirty different types of this important fire-extinguisher are said to be in use, and one form or another has been very widely adopted in mills and factories throughout the country. The idea is extremely simple. A water-tank on the roof of the mill is connected with a system of pipes extending along the ceilings of the different rooms. At intervals of a few feet is a hose nozzle kept closed by a plug of fusible metal. On the starting of a fire near one of these nozzles, the rising temperature melts the plug, and a shower of water is released on the fire, putting it out without human supervision or aid. These automatic sprinklers have already saved property and

proved their usefulness, and it is a matter of surprise that they have not been more generally adopted in churches and theaters, stores and shops, as well as factories.

The new home fire associations adopt among their first appliances small portable hand-pumps to be placed in a pail of water, and operated by one hand while the hose is held in the other. The chief value of a simple hand-pump lies in its cheapness and lightness. It can be carried and used by a child, and is not liable to get out of order. Its very simplicity inspires confidence, and a child using one to fight a small fire quickly learns coolness of head and steadiness of hand. If in the excitement of the moment the first stream is misdirected, he soon steadies his aim, and seeing how effective a small, well-directed stream may be, he gains confidence and does good work. A mere dash or film of water on wood just in advance of flame prevents its spread, and this too inspires confidence. A pail of water dashed all at once may fail to put out a fire, where a quart or two, properly applied with a pump, may prevent a great disaster. Besides this, these hand-pumps can be fitted with hose, and by the aid of a pole the hose can be raised to a burning roof or window, and the little machine do good where an extinguisher would be useless.

A more recent invention, and a most convenient and portable, is the hand-grenade, now well known. This consists of a glass bottle filled with water charged with certain chemicals. The design is to use the bottle like a grenade or hand-shell. It is to be thrown upon the fire and broken, when the contents escape upon the flames. The influence of the water is of itself comparatively slight, as the bottle only holds one pint. The suppression of the fire, it is claimed, is obtained by the development of a gas by the heating of the water by the fire, the flames being stifled by the exclusion of the oxygen of the air. These hand-grenades have proved of value in a large number of incipient fires, and have undoubtedly saved a great deal of property. In certain situations, as where the flame comes in direct contact with the bottle, they are automatic fire-extinguishers, the heat breaking the bottle and releasing the gas. The advantages of these grenades appear to lie in their convenience, in the fact that they are always ready and cannot freeze, and that it requires no special skill to use them. The only objection to their use is in the fact that in the excitement of a fire they may be wasted by misdirected aim in throwing them at the fire, and the fact that in the majority of fires in dwellings the flame is in the wall, or in some corner where it cannot be reached by the grenade. However, their advantages are great. Another recent invention is intended to combine the advantages of the hand-pump and the grenade. This is a brass bucket with a tight cover, and fitted with a hand-pump, so that pail and pump are always together and in a convenient position for use. The bucket is to be filled with a liquid similar to that used in the grenades, and operating on the same principle. There are, besides these more important inventions, a number of minor tools and appliances for increasing the efficiency of the pumps, extinguishers, and grenades which will be found useful in home fire protective associations.

BRIC-À-BRAC.

THE FIRST BICYCLE IN REMUSVILLE.

"My King! ef dar ain't de berry ole Satan hisself, tail an' all, a-gwine about de kentry a-straddlin' of a buggy-wheel."

The Book-Hunter.

A CUP of coffee, eggs, and rolls
Sustain him on his morning strolls :
Unconscious of the passers-by,
He trudges on with downcast eye ;
He wears a queer old hat and coat,
Suggestive of a style remote ;
His manner is preoccupied,—
A shambling gait, from side to side.
For him the sleek, bright-windowed shop
Is all in vain,—he does not stop.
His thoughts are fixed on dusty shelves
Where musty volumes hide themselves,—
Rare prints of poetry and prose,
And quaintly lettered folios,—
Perchance a parchment manuscript,
In some forgotten corner slipped,
Or monk-illuminated missal bound
In vellum with brass clasps around ;
These are the pictured things that throng
His mind the while he walks along.

A dingy street, a cellar dim,
With book-lined walls, suffices him.
The dust is white upon his sleeves ;
He turns the yellow, dog-eared leaves
With just the same religious look
That priests give to the Holy Book.
He does not heed the stifling air
If so he find a treasure there.
He knows rare books, like precious wines,
Are hidden where the sun ne'er shines ;
For him delicious flavors dwell
In books as in old Muscatel ;
He finds in features of the type
A clew to prove the grape was ripe.
And when he leaves this dismal place,
Behold, a smile lights up his face !
Upon his cheeks a genial glow,—
Within his hand Boccaccio,
A first edition worn with age,
"Firenze" on the title-page.

Frank Dempster Sherman.

Heart and Head.

I LOVED her in the early spring,
When bluebirds mate and robins sing ;
My heart cried haste ! oh, speak ! make haste !
My head made answer, haste is waste !

I dropped the corn, I sowed the wheat,
The summer came with blossoms sweet ;
And all the time my heart cried haste,
And head made answer, haste is waste !

I stacked the grain, I sheared the sheep,
I reasoned that my love would keep ;
My heart's loud cry of haste, oh, haste !
Was silenced still by haste makes waste !

The ground is covered o'er with snow,
Another wed her weeks ago !—
My mocking heart cries haste, make haste !
And mocking head, oh, haste makes waste !

Jennie E. T. Dove.

A Culprit.

THE maiden aunt, in her straight-backed chair,
With a flush on her pale and wrinkled cheek,
And a horrified, mortified, mystified air,
Was just about to speak.

And the maiden niece—a nice little maid—
Stood meekly twirling her thumbs about,
And a half-triumphant, half-afraid,
And wholly bewitching pout.

Said the maiden aunt : "Will you please explain
What your heads were doing so close together ?
You could easily, I assure you, Jane,
Have knocked me down with a feather !

"When I think of your bringing-up—my care,
My scrupulous care—and it's come to this ! you
Appeared to be sitting calmly there,
And letting a YOUNG MAN KISS you !

"Now tell me at once just what he said,
And what you replied. This is quite a trial,
So do not stand there and hang your head,
Or attempt the least denial !

"If I catch you once more in such a—fix,
Though you are eighteen, I can tell you, Jane,
I shall treat you just as if you were six,
And send you to school again !

"Are you going to tell me what he said,
And what you said ? I'll not stand this trifling,
So look at me, Jane ! Lift up your head !
Don't go as if you were stifling !"

Her voice was shaken—of course, with fear :
"He said—he said, 'Will you have me, Jane ?'
And I said I would. But indeed, aunt, dear,
We'll never do so again !"

Margaret Vandegrift.

Appearances.

'Tis bes' to drop into de way o' lookin' into things ;
Don't take a s'picious quarter tell you notis how
it rings ;
De wum dat bites de June apple will find a place
to hide,
An' de one upon de backer-leaf will take de under side ;
An' a water-milion in de patch dat seems to thump
de bes'
May show de meanes' inside when it come to stan'
de tes'.
You better not be buyin' all de handy things you
cross,
Tell you find out sumfin' 'bout 'em an' diskiver what
de cos'.
De April showers mighty often make de crab-grass
grow ;
De mornin'-glory's lubly, but it hides de cotton row ;
De stump-tail dog dat he'ps you 'long by thinnin'
out de rats
May spile de bizniss dreadful if he dribes away de
cats ;
De sparrer-grass won't do to eat dat sparkles wid
de jew,
An' de fancy palin's on de fence may let de rabbit
froo.

No. 2.

THE CITY OF TEHERÂN.

FIRST PAPER.

THE present capital of Persia owes its importance to the fact that it was made the seat of government by Shah Aga Mohammed, the founder of the dynasty of the Khajârs, about a hundred years ago. Teherân (the circumflex is used in this article, to mark the accents, in proper names) is an old city; it was called by Pietro de la Valle the city of plane trees; and its well-ordered bazaars had a wide repute in his time. But until it became the capital it could not be considered in any sense a rival of Ispahân or Shirâz, or other important and ancient cities of Persia. The monarchs of the Khajâr dynasty have been men of ability and enterprise, and their capital, from being a small, comparatively unknown town, has become one of the most flourishing and active cities in the East, with a growing population of nearly two hundred thousand souls. Although it possesses few such noble examples of ancient architecture as one finds at Ispahân, yet a sketch of Teherân will give one a very good idea of life in Persia, while its suburbs present most of the features peculiar to Persian scenery.

On approaching Teherân by way of Resht on the Caspian, one ascends upwards of six thousand feet; and on reaching the Kharzân Pass, it would seem that a corresponding descent would lead to the great plains of central Persia. But, on the contrary, the southern descent is but two thousand feet; this accomplished, the traveler finds himself on a vast plateau four thousand to five thousand feet above the sea level. Teherân consequently occupies a lofty position, while appearing to be on a plain of ordinary elevation stretching east, west, and south as far as the eye can see. This accounts for the ease with which

in that region one gets short of breath with any unusual exertion, a difficulty which passes away after the lungs have become accustomed to an otherwise delightful atmosphere.

There could hardly be a greater contrast of scenery than that presented by the two sides of the pass above mentioned. On the north side, the mountains concentrate the moisture from the Caspian, and numerous streams descend to the sea. This abundance of humidity produces a vegetation almost tropical in variety and luxuriance. The road winds through primeval forests of extraordinary density and beauty. The venerable gnarled trunks are green with moss or embraced by the long tendrils of clambering vines. Often the emerald gloom of the forest is brightened by the vivid scarlet blossoms of the pomegranate gleaming like glints of light. Near the sea are noble lawns and vistas of green fields, old granges, thatched huts of the peasantry under superb masses of overarching foliage, and moist rice-fields where women wade bare-legged and regardless of veils. But in the forest lurk the panther and the tiger and the frequent and persistent mosquito; while the deadly miasma rises from the steaming rice-fields, there being few who are not wasted or destroyed by the all-pervading fever.

But as one begins to ascend the mountains he becomes aware that he is entering upon scenery of a different character—so different, indeed, that he seems to have passed into another hemisphere. The atmosphere is also entirely different. On the north side the damp heat causes the perspiration to start as if from a steam-bath; while the air on the ridge is dry, and although the temperature is even

higher, the heat is far less relaxing. When, therefore, the excessive dryness of the Persian climate is mentioned, exception should always be made of the Caspian provinces of Gilân and Mazanderân, the air of which is quite the reverse of dry.

Probably no drier atmosphere than that of Teherân exists except in Sahara. But this, after the stranger becomes acclimatized, is favorable to pulmonary, nervous, and rheumatic complaints. The spring and autumn are exceedingly delightful; in summer the heat in the city ranges from ninety-five to one hundred and ten in the shade, but is endurable because of its dryness, provided caution is exercised against exposure to the direct rays of the sun. The Europeans and many of the Persians generally spend the summer in the numerous and attractive villages nine or ten miles from the city, fifteen hundred feet higher, on the talus of the Shimrân. During the day a brisk breeze from the south-west blows like a trade-wind, and at night a cool gentle wind from the mountains lowers the temperature an average of ten degrees Fahrenheit. In the Shimrân the temperature ranges in summer from seventy-two to ninety degrees, rarely reaching the latter figure.

The Shimrân is a part of the great Elburz

chain which extends from the Caucasus to Merv. Shimrân or Shim-Irân means the Light of Persia. Gradually ascending directly from the walls of Teherân, the range at a distance of only ten miles soars with sudden precipitousness to the enormous height of thirteen thousand feet above the sea. During the whole summer snow is seen on the summit, while in winter it is clothed with a dense mantle of ermine to the plains. Nothing more magnificent in the way of mountain scenery could be imagined. From every part of the city, as I write, the glittering ridge of the Shimrân is seen above the house-tops, or forming a magnificent background at the end of the streets leading north and south. In summer these mountains are, it is true, nearly destitute of vegetation, but the grandeur of the rock formations and their varied color fully compensate for the absence of verdure.

North-east from Teherân, about forty miles distant, is another feature of the landscape which, when it has been once seen, can never be forgotten. I certainly shall always remember the moment when, on my way from Cas-been and yet ten miles from Teherân, we turned a sharp corner in the road, and the mighty peak of Demavênd burst on my view

A STREET IN TEHERÂN, NEAR THE PALACE.

THE SHAH, NUSR-ED-DEEN.

for the first time. Although still so distant, it produced an overpowering impression of solitude and sublimity. The height of Demavënd by barometrical pressure, has been variously estimated by the few adventurers who have reached the summit; the most recent and the most reliable calculations agree in placing it at nineteen thousand six hundred, to twenty-one thousand feet above the level of the sea. The form of the peak is very nearly pyramidal, with the extraordinary average inclination of thirty-six to thirty-eight degrees. Soaring, as it does, nearly ten thousand feet above any mountains in the immediate vicinity, it is invested with a spirit of regal isolation. The peak springs out of a vast wind-

ing crater two thousand feet deep and of great extent, called the Valley of the Lar. I visited this tremendous scene of desolation in summer, scaling the Aftcha Pass, thirteen thousand feet high. The Lar River, which winds through the valley, is well supplied with fine trout, many of which festooned my tent-pole and sated appetites made keen by the mountain air.

The mountains make a curve to the southwest of Teherân, terminating in a rocky ridge two thousand feet high. Around the base of this ridge is the site of the ancient city of Rhages, reputed to have had a million inhabitants in the time of Darius. In later ages the city was called Rheï, although by modern Per-

sians still known as Rhazee.* Rhages is mentioned several times in the Book of Tobit. The abundance of salmon in the Persian rivers north of the Elburz, and the facility with which they are brought to Teherân, packed in ice, seem to suggest that the fish mentioned in

was captured and destroyed in the thirteenth century by Hulagu, the Mogul.† The ruins of Rheï are still found at intervals of considerable space, including a number of dilapidated towers. The peasants have picked up coins, gold necklaces, and bracelets there. But no

RUINED TOWER AT RHEÏ, NEAR TEHERÂN.

the Book of Tobit, in connection with the city of Rhages, belonged to that species. It is, however, singular that so little is said about this great city by ancient writers. It has not even separate mention in classical dictionaries. Yet Rheï was the capital of the Arsacidæ or Parthian dynasty, and later, in the twelfth century, of the celebrated Alp Arslân. The city

regular exploration has been made, although, if the Government were willing to grant permission, there can be little question that valuable discoveries would reward the intelligent explorer.

On a ledge overlooking the site of Rheï is the Parsee cemetery of Teherân, a white spot on the purple side of the bare mountain con-

* It must be admitted that Rawlinson inclines to the theory that Rhages stood, not at Rheï, but on the site of the city whose ruins are near the village of Shahr-i-Veramin, in the district of Veramin, about thirty miles south-east of Teherân. The basis of this opinion appears to be the statement of Arrian as to the distance from Rhages to the defile called Pylæ Caspiæ. But here Rawlinson and others who accept his conclusions must concede that their argument is possibly a begging of the question; for the exact position of the Pylæ Caspiæ is yet far from being a settled question. On the other hand, a personal observation of Veramin leads me to see nothing in the style and character of the antiquities at that place to indicate that they antedate the mausoleum or brick tower of Rheï, of which an engraving accompanies this article. While the widely spread ruins of Rheï thus suggest the former existence

of a much larger city than we are led to infer stood at Veramin, it is also an important point that the general traditions of the Persians themselves are altogether in favor of Rheï.

† Naïzmudin, a Mohammedan author who was a native of Rheï and escaped with his life at the great destruction of that city by the Moguls, says: "Could there well be worse slaughter than there was in Rheï, where I, wretched that I am, was born and bred, and where the whole population of five hundred thousand souls was either butchered or carried into slavery?"

We who live in the present more favored age and more favored lands, find it difficult to realize the enormous crimes of history; so astounding are they that we pass them over without consideration, for the imagination fails to grasp their horrible details.

PART OF TEHERÂN AND THE SHIMRÂN AND
ELBURZ MOUNTAINS.

spicuous for many miles. It is a circular inclosure open to the sky. The dead are laid in shallow, open graves exposed to the elements. The destination of the departed soul is supposed to be indicated by the eye first devoured by the ravens; the right eye means heaven, the left hell. This is a simple system of eschatology, although its results cannot always be satisfactory to the friends of the departed. Six miles from Teherân, and near the site of Rheî, is the celebrated shrine of Shah Abdül Azeem, a famous saint of the Sheäh profession. The Turks are Sunnees, but the Persians are Sheäns, deeming the Holy Husseîn, the son of Alee, to have been the true heir to the caliphate. But the Holy Husseîn and his sons were slain by the caliph accepted by the Sunnees; hence an irreconcilable feud between the two sects. The Persians are a brilliant, intellectual race, vivacious, much given to lively conversation, speculation, and even religious skepticism. There are, doubtless, numerous intellectual Persian gentlemen who accept some form of Sufeism. The Babs or followers of the Bab, who founded a species of Mohammedan Pantheism, are also numerous, notwithstanding the fact that in public they practice the rites of Mohammedanism. But the Mollahs or hierarchy consider, from their point of view, that a theocratic government must depend largely for perpetuation on the outward profession at least of the doctrines that gave it birth. The Mollahs are thoroughly organized, and are strengthened by a strong *esprit de corps*. No one dares openly to defy

their authority. Believers and unbelievers are therefore united in devoting the Sunnees to the bad place. Their religious festivals come often enough to afford relaxation in making pilgrimages to the numerous shrines of the saints, into which as well as into the mosques no Christian can enter without risking his life. Meshêd enjoys great celebrity as a shrine, for there lies buried Imâm Rhezâh, one of the twelve holy Imâms who descended from Alee and Fathimêh. Koom is another resort of great sanctity, for, besides containing the bodies of several hundred saints, the mother of the Prophet is reputed to be enshrined in its holiest sanctuary.

But there is no sacred resort in Persia more celebrated than that of Shah Abdül Azeem, which is so conveniently situated near the capital that, at a moderate estimate, it is visited annually by three hundred thousand pilgrims from Teherân alone. The gilded dome over the tomb of the saint may be seen for a great distance glittering like a star over the plain.

Here, then, surrounded by such scenes of natural, historic, and ethnic interest, lies the capital of Persia. But the city of Teherân

A THEOLOGICAL STUDENT.

merits description not only for the charms of its environments, but likewise for its own special attractions. It was formerly surrounded by battlemented walls, but as the city has developed and spread in every direction the old walls have been razed. Earthworks, supplied with a deep fosse and laid out after the modern system of city defenses, are now thrown around the entire circumference of Teherân, at a sufficient distance to allow space for the expansion of the population. Numerous avenues lead out of the city to the roads of Casbeen, Hamadân, Shimrân, Yusufabâd, Doshantepê, and elsewhere. A magnificent gateway has been erected where each of these roads enters the city. While they are alike in general style, each has a character of its own. A description of the gate of Shimrân will give one an idea of the later Persian system of constructive decoration, which began soon after the Saracenic invasion, and probably reached its culmination in the time of Shah Abbas, although arriving early at a high degree of excellence.

Whatever relates to Persian art is of importance, for no nation has ever borrowed so little from others in the arts, or lent so many

architectural and decorative ideas to other schools. The ancient Greeks had the double capacity to borrow art ideas from Egypt and Persia, and to adapt them to the materials and needs of their own climate and religion. The Arabs in Spain and Portugal, when they sought to beautify the Peninsula with admirable constructions, invited Persian artists to found there what is called Saracenic architecture. The results affected in hardly less degree the Christian architecture of those and the neighboring countries. One has but to reside a few months in Persia to find on every hand the germs of the Saracenic school, and the types of forms reproduced under other conditions elsewhere. Like all true architecture, that of Persia has always been constructive, combining at once use, adaptation to the materials at hand, and a harmonious blending of form and color. The principal features of the Persian Saracenic are the arch, glazed bricks or tiles of various colors, elegant designs in mosaic composed of small bits of glazed brick, and stucco-work. The Gate of Shimrân is a lofty central arch, supported by deep arched niches on either side and smaller ones above. The effect of what might perhaps seem a heavy design is lightened

by graceful turrets or pinnacles rising from the roof. The entire fabric is incrustated by an outer layer of orange-yellow, black, and azure bricks, highly glazed and arranged in elegant geometric designs. Over the main

square is entered through six stately gates; the two on the south side lead one to the *anderoon*, or woman's quarter of the palace, and the other to the palace itself, the foreign office, and the quarters of the Naib Sultanéh,

PARSEE CEMETERY, NEAR TEHERÂN.

arch is a colossal mosaic painting, including many colors, which represents Rustêm, the Achilles of Persian legend, mounted on a rearing steed and armed with a coat of mail, engaged in a fierce conflict with his enemies.

But of the many city gates of Teherân, the handsomest is probably the large one before the ark or citadel on the north. It faces the great square of the Department of War, which is in itself a handsome and imposing inclosure. In the center is an octagonal marble tank one hundred and fifty feet long and always full to the brim. At each corner of the basin an enormous cannon is mounted on a platform. The four sides of the square are taken up with barracks and government offices, in two uniform stories, constructed with graceful arches, and including on the east side a handsome balcony supported by light pillars and faced with mosaics of glazed tiles. This

or Minister of War, who is the third son of the Shah. The latter gate I have already alluded to. It is probably seventy feet high. Above the central gate the wall is pierced by a smaller arch, protected by a balustrade. Above fly the colors of Persia—the Lion and the Sun on a green ground. At sunrise and at sunset a band of musicians collect in this lofty gallery with horns, cymbals, and kettle-drums, and hail the hour with nondescript music such as Beethoven and Mozart never dreamed of. It is curious that, notwithstanding the highly cultivated artistic sense of the Persians, they have no better notion of the harmonies of sound. This does not appear to be for lack of a musical ear, for their stringed instruments are capable of fine expression, and the military bands instructed by Europeans, I am informed, very soon seize the *motif* of European music. At the diplomatic dinner given

by the Naïb Sultanéh on the eve of the birthday of the Shah in 1884, the various national tunes, including "The Star-Spangled Banner," were played with spirit and effect.

The architectural decorations already described are not confined to the public buildings

nished with seats and niches and roofed by an arch. Above is a *balâhané*, or lodge, provided with curtains and perhaps stained-glass windows. Strange to say, the street entrance itself is a low, square, modest door, simply relieved by heavy knockers of figured iron or brass.

PILGRIMS AT THE SHRINE OF SHAH ABAB ABDÛL, NEAR TEHERÂN.

of Teherân. At every turn one discovers the love of beauty inherent in the national character. The arched doorways of the shops are decorated with a mosaic of glazed tiles or bricks, or with the peculiar honeycomb work so notable at the Alhambra. This is done in stucco, often colored and gilded, sometimes in a rude but always a thoroughly effective style. The entrances to the houses are generally ornamented in this manner, and are formed by the recession of the street wall in a semicircle, fur-

Through this unimposing entrance one passes into a darksome passage, which but little suggests the spacious and attractive court to which it leads. The court is paved, but laid out in the center with trees and shrubbery around a tank stocked with gold-fish. If the house belongs to a man of position, the first court is surrounded by the servants' rooms, offices, and stables. This, however, does not prevent the walls from being abundantly decorated with *gatch*, or stucco-work. Thence

we proceed to the chief court, which is rendered attractive by a wild luxuriance of foliage and flowers. Here is the main dwelling, as entirely secluded as if in the heart of a wilderness instead of a large city. Sometimes this building is of two stories; in general, however, it is only one lofty story in height. The first glance at the windows reveals the fact that the Persian architects are masters of the secret of successful decorative architecture. They appreciate the importance of massing the effect instead of scattering it by meaningless details, as in most Renaissance and all modern European and American architecture. It does not matter how exuberant the decoration may be, provided it is as far as possible constructive and relieved by simple lines and comparatively blank spaces. Thus only can repose, so essential in art, be obtained. The Greeks understood this. Study the Parthenon as the finest example extant of this principle; study also the façade of the Cathedral of Chartres as an example in Gothic architecture; and compare these with the new Houses of Parliament in London.

However Persian art may at the present day be inferior in grandeur to that of the Achæmenidæ, the Sassanidæ, and the Sefavees, the same love of beauty, the same fine artistic sense continue to inspire even the most ordinary workman. What implements they used in ancient times we know not; but to-day the Persian artisan has neither rule, compass, nor spirit-level. He is commonly ignorant of the fact that the diameter is the third of the circumference; his gimlets and augers are prods turned by a bowstring; he has no hatchet, but only an adze, and no carpenter's bench. If he desires to plane a board, he puts it on the ground; and if he would saw a block of wood, he squats on the ground himself and holds it between his toes, drawing the saw towards himself. Wood is scarce, and with such tools hard to work. If pillars are to be constructed, the trunks of poplars are raised and simply stripped of their branches and bark. They may be crooked, but that matters not; the master workman tells his subordinate to shape the timber into an elegant pillar with *gatch*. Depending only on his eye and the skill of his hand, this simple artisan applies the plaster round the trunk in the form of a fluted pillar and crowns it with a graceful capital and cornice, showing a lively inventive fancy. If judged by the strict application of rule and compass, these decorations may sometimes deviate slightly from a straight line, but of the artistic beauty of the conception there can be no question. Walls and ceilings are tastefully decorated in like manner.

A GUEBRE OR PARSEE.

Now I have spoken of the windows of Persian houses as exponents of the national taste. Instead of piercing the wall of each apartment with several square, decorative apertures, the architect of Teherân groups all in one large square central window reaching from floor to ceiling. This is again divided by mullions into three or four spaces. The sashes are filled with small square or diamond-shaped panes of stained glass. Both the exterior and interior effect is very agreeable, while in warm weather the entire side of the apartment can be thrown open like a piazza by raising the sashes.

The larger apartments are often divided by partitions of sashes and mullions similar to the windows. In winter the rooms can be thus reduced in size, while in summer a current of air circulates everywhere, aided by picturesque wind-towers or shafts on the roof called *badger*. The doors are closed by superb portières, and the floor, which is invariably of earth beaten hard, is covered with a matting overlaid with rugs and carpetings. Latterly the Persian gentleman of Teherân, when receiving Europeans, has learned to offer them chairs; but when by themselves the Persians always sit on the floor, resting on their heels, but with cushions behind them. This posture must be acquired in childhood to be endurable.

Adjoining this court is the anderoon, or house devoted to the feminine portion of the family. It has a court of its own, and is as sacred from the impertinent eyes of men as if

GATE BETWEEN THE SQUARE OF THE DEPARTMENT OF WAR AND THE CITADEL.

it were a convent. The master of the house alone has access to the anderoon. And when he is there no one must disturb him ; neither may one open a window overlooking any part of such an establishment.

After what has been said of the charms of a dwelling in Teherân, it may be a surprise to learn that even the most costly mansions are constructed of sun-dried bricks and that the flat roofs are of mud. But in a climate like this these bricks are very durable. Some of the towers of Rheî, still standing after twelve centuries, are of this seemingly perishable material. Lightness combined with strength is often gained in Persia by building a wall of square sun-dried bricks, ingeniously arranged in hollow cubes as in a block-house. They are cemented together by a layer of *cargel*, or mortar mixed with straw, over which, in turn, follows a coat of white plaster. Where great strength is required the angles are fortified by a layer of burnt bricks. Such a wall will stand for ages. It is interesting to watch the builders at work. They wear long tunics, which are tucked into their girdles when working, displaying a length and muscular development of limb I have never seen equaled elsewhere. The one above sings out in musical tone, "Brother, in the name of God, toss me a brick." The one below, as he throws the

brick, sings in reply, "O my brother (or, O son of my uncle), in the name of God, behold a brick."

Less can be said, however, in favor of the roofs of mud. The only reason why they should be used is the rarity and costliness of wood in central Persia ; perhaps, also, because a roof of great density better protects the house from the long, penetrating heat of summer. In that temperature also lies the safety of these roofs. Heavy undressed timbers are laid across the walls. Over these comes the lathing. In the better houses square, broad burnt bricks are laid on the lathing and over these a layer of mud ten to twelve inches thick ; but generally the bricks are dispensed with. During the summer such a roof becomes very hard, and when the surface is made slightly inclined to allow the water to run off, long and heavy rains are required to penetrate it. After the wet season the surface is rolled again for the next winter. With these precautions such roofs last a long time in Persia. But there comes a time with most of them when a little seam appears in the ceiling ; then follows a trickling stream, and the occupants, thus warned, remove the furniture without delay to the adjoining apartment. If the rain continues, the ceiling falls in. Occasionally one hears of fatal accidents or very narrow escapes from falling roofs in

PAVILION OF THE ANDEROON, OR WOMEN'S APARTMENT, ROYAL PALACE, TEHERÂN.

Teherân, but accidents may generally be avoided by proper precaution.

The manners of the courtly occupant of this Teherân mansion are guided by an etiquette that is indeed "a law of the Medes and Persians, which changeth not." The visitor sends notice an hour or two previous to calling. If the visit is one of importance, notice is sent the previous day. You will go in a fashion suited to your social position and the rank of the host. Whether on horseback

or in a carriage, you will be accompanied by a number of mounted attendants. As you approach the house, servants, mounted or on foot, come forth to meet you, and one returns with speed to announce your coming. A dozen attendants escort you to the reception-room. According to your relative rank, the host meets you at the foot of the staircase, at the door, or at the upper part of the room. The question of seats is one also requiring the utmost circumspec-

tion in observing the various shades of rank. If your rank is superior to that of the host, you are invited to occupy a sofa alone, at the upper corner, while the host sits on a chair or on the floor at your right. The left is more honorable than the right in Persia. If of equal rank, he occupies the sofa with you; but if you are inferior, then the positions are reversed. The upper corner of the room is in any case the most honorable position. If a number are present of various ranks, each one knows his place at a glance. The passing of refreshments is also a matter of undeviating strictness, the number and quality depending upon the time of day and the character of the guest. The *kaliân*, or water pipe, offers a fine opportunity for a display of Persian manners. According to precept and custom, a Mohammedan cannot smoke the same pipe with a Christian, and, except on rare occasions when the host is a man of progressive views, a separate pipe is furnished for a European visitor. But among Persians it is the custom for the highest in rank to receive the pipe first, offering it to each in turn before smoking himself. For

an inferior to accept the offer is an incredible offense against good manners. But each in turn after this ceremony takes a few whiffs at the pipe, all taking care to eject the smoke from the bowl before offering it to the next. The attendants on such an occasion leave their shoes at the door and retire backwards.

When one goes through the streets of Teherân by night, the effect is even more singular than by day. Except in the Arsenal square and around the ark or palace precincts and one or two neighboring streets, where gas has been introduced and recently also the electric light, darkness reigns in Teherân after twilight; no one goes abroad without a lantern, while the rank of a gentleman is indicated by the number and size of the lanterns carried before him. Often the brass top and bottom of these lanterns are wrought in cunning designs, displaying to advantage the rich fancy and skillful handiwork in metals for which Persia has been and continues to be justly famous. An efficient police force organized by the Count of Monteforte keeps the streets sufficiently quiet and secure, but there is one danger which one is

PORTRAIT OF FETH ALI SHAH, GREAT-GRANDFATHER OF THE PRESENT SHAH, IN THE PANEL ON THE RIGHT.

liable to encounter in the streets of Teherân; I refer to the openings over the *connaughts* or watercourses. It is inexplicable, the indifference shown regarding these traps, into which many an unwary victim falls, often with loss of life, sometimes, indeed, dropping in an instant into oblivion.

The system of supplying Teherân and other Persian cities with water is remarkable and probably unique. There is scarcely a civilized country so poorly supplied by nature with wood and water as Persia south of the Elburz. During the short winter there is some rain and snow, upon which are dependent the crops of the neighboring district of Veramîn, the granary of Teherân; but the remainder of the year there is absolutely no rain, except on the extreme mountain-tops. The question naturally arises, how are the cities to be supplied with water, for it cannot always be obtained by digging wells that are necessarily of great depth. But the snow and rain on the mountains feed the streams dashing down the precipices or the springs near their base. These streams and springs are tapped and conducted to the city by subterranean aqueducts called *connaughts*. In order to carry these ducts in a straight direction, shafts are

dug at intervals of thirty to eighty yards. The earth thrown out of the shaft forms a hillock which is allowed to remain. Thus the landscape is marked by many hundreds of these elevations resembling ant-hills. The mouth of the shaft is left uncovered, and hunters or travelers by night must take good care not to fall in. The water thus obtained is naturally expensive, and each person pays a proportionate sum per month for the supply for his garden or household. Teherân is provided with no less than thirty of these aqueducts, excavated at immense cost and labor.

The city of Teherân properly consists of the old part, and the new called the European quarter. In the latter are the English, French, Turkish, and United States legations. The Austrian, German, and Russian legations are in the old quarter. The number of Europeans in Teherân is about three hundred, but they probably constitute not one-fortieth of the population of the European quarter, in which many Persians of wealth and station have elegant gardens and residences, among which may be mentioned the extensive and beautiful gardens of the Mohper-ed-Doülêh, or Minister of Mines and Telegraphs, and of the Prince Governor of Ispahân, the oldest son

of the Shah, called the Zil-i-Sultân. Here also are two spacious gardens of the Shah, and the new public garden. The former, for the benefit of the public, are inclosed by a fence instead of a lofty wall, and the latter is open to all and commands a noble prospect over the Shimrân and Mount Demavênd. The broad streets of this quarter are lined with shade trees. The main avenues run north and south, and towards evening the Persians enjoy strolling there and gazing upon the ridge of the Shimrân, roseate in the light of the setting sun.

But in the old quarter, occupied by over one hundred thousand people, the streets are generally narrow and tortuous, relieved at intervals, however, by squares beautified in the center by vast tanks and picturesque clusters of mulberry-trees and *chevârs*. Here, also, are the covered bazaars, considered to be the most interesting and complete in Persia. In threading these streets and bazaars, whether

on foot, on horseback, or in a carriage,—for there are over five hundred European carriages in Teherân,—one sees the advantage of having attendants to clear the way. Without them it would be very difficult to proceed, as there are no sidewalks, and the way is often blocked by a motley throng of veiled women, beggars, porters, fruit-venders, donkeys, horses, and camels. These attendants use no ceremony in jostling every obstacle out of the way, laying the lash on man and beast alike, and bestowing various epithets, of which the most common is, “O son of a burnt father!” From time to time a grave, handsome, heavily bearded and turbaned priest, mounted on a donkey or mule, gives a wonderfully ancient and oriental aspect to the scene, as he moves with immense dignity through the surging throng, followed by mounted attendants bearing his saddlebags and kaliân.

S. G. W. Benjamin.

SAINT ELIZABETH.

SAINT ELIZABETH, laden with bread,
 Seeks her people sore bestead
 With hunger heavy and long.
 Home rode Louis with jest and song:
 “What bearest thou, Elizabeth?
 Hast thou no courtier left,
 Of knights art thou bereft?
 Nay, blush not, my sweet love;
 Nay, tremble not, my dove,
 Unfold thy robe that I may see
 What thou dost bear so secretly.”

With sweetest shame and cheeks of red,
 Forth she showed her stores of bread.
 Lo! nought his eyes doth greet
 But rarest flowers full meet
 For hands and brow so sweet.
 “Ah, fair saint, ah, sweet love,
 Mine eyes can see the Dove
 Alight on thy fair golden head,
 Turning thy bloom again to bread.”

T. T. Munger.

A CHILD OF THE AGE.

I.

HE was a *mauvais sujet*; at all events that is what they called him—a bad lot. He grew so accustomed to the epithet that he ceased to resent it. Very likely there was something wrong about him, a natural perversity, a rebellious and undisciplined spirit. He could climb like a squirrel and swim like a seal; but those were not accomplishments which were highly appreciated in his home. Every Greek verb he had learned had been accentuated upon his back with a horrible bamboo cane; and yet he was far from being an expert on accents. He hated Greek with an intense and refreshing hatred; and he could express himself on the subject with an ardor and emphasis which showed linguistic powers of no mean order. Had he not been an only son, and a very handsome one at that, he would have been shipped to sea before he was fourteen years old; but a gentleman of position and wealth cannot afford to have it known that he has disposed of an only son in that fashion. And it was this consideration rather than any parental tenderness which induced Judge Gamborg to persevere in his discipline a few years longer, just to see what it might lead to. He had not much hope, it is true, that the result would be anything to boast of; but then he did not demand much. He had long ceased to be ambitious for his son. If the lad would only *look* like a gentleman, it would be something by way of encouragement. The Judge would sometimes, in a mood of humorous despair, offer a premium of twelve cents for every day that Harold staid combed, clean, and with skin and clothes in proper repair. When, at the end of such a day, the boy received the little silver piece with the head of King Oscar I., he would pocket it triumphantly, yet with the reflection that it was hard-earned money. The success of these experiments sometimes would make the Judge sanguine, and he would indulge the hope that perhaps Harold might, in time, be able to enter the University, and become a respectable man. The wildest colts, they say, sometimes make the best horses; and if the degree of wildness were to indicate the measure of future excellence, Harold would be a wonderful man indeed. He would stop at nothing short of the premiership. From his earliest boyhood he had shown that he felt at home in exalted posi-

tions. His favorite haunts were roofs, glaciers, and mountain-tops. Often he would sit astride the roof-tree of the house, singing or shouting against the wind, while his hair was blown wildly about his head, and the starlings and swallows, whose nests were under the gable, flew screaming about his ears. Then he laughed and was glad. On the glacier which was but a few miles from his father's house, he leaped and climbed like a goat from ledge to ledge, thrusting his steel-spiked boots into the ice, and reveling in the excitement and danger. The whippings with which he expiated these unlawful expeditions, he regarded as, on the whole, a fair price which he paid for the sport; and they never discouraged him from repeating the offense. In the world, as he knew it, the bamboo cane belonged to the normal order of things, and was to be accepted, along with other ills, with manly stoicism.

It was a miracle that he grew up; if he had come to an untimely end, his mother and his sister Catherine would have shed some decent tears, perhaps, but would have comforted themselves with the reflection that it was only what might have been expected. In fact, there was no one who would not have been resigned to any calamity which would have removed him to a distance where he would cease to be a source of trouble. But there is no relying upon calamities, and they never come to those who at heart would welcome them, though tearfully. But when the boy one day, having secured a box of cartridges, arranged them in geometrical figures in his mother's cane-seat chair, and Mrs. Gamborg unsuspectingly took her dinner seated upon this formidable battery, then the Judge was thoroughly aroused, whipped the boy, and sent him away to school. There was no possible danger connected with that cartridge experiment, but the idea was yet so terrible to Mrs. Gamborg that she fainted dead away, and when she came to refused to say a word in the boy's favor. So away he went, and when, at the age of eighteen, he came back, he had actually entered the University. There was great rejoicing that summer over the returned prodigal, and the fatted calf was not spared. But when the festivities were over, the family found to their dismay that Harold's transformation was less complete than they had supposed. He had brought home all sorts of strange and wicked notions, and not even a

regard for his mother's weak nerves would restrain him from uttering them. He walked to and fro on the floor with his father by the hour, disputing with him, and contradicting the old gentleman with an audacity which made the ladies open their eyes wide in amazement. And the Judge was at times himself so overcome that he had to sit down and be fanned while Catherine ran for a glass of water. It was shocking, incredibly shocking, to be told in his own house that any common peasant or laborer had the same right to "life, liberty, and the pursuit of happiness" as himself — Judge Ralph Thorwald Gamborg! That the French Revolution was not the work of the devil, but a just uprising against tyranny, a legitimate result of a deplorable condition! That it might become the duty of a good citizen to oppose with his vote and influence His Majesty the King, when he went wrong! Were such heresies ever before uttered in a respectable house? They were far worse than that gunpowder plot which might, if it had not been for the miraculous interposition of the Lord, have launched Mrs. Gamborg prematurely into eternity. But what could you expect of a boy who at fourteen could thus wantonly imperil his mother's life? No, there was no denying it; he was a *mauvais sujet* — a bad lot.

There was a singular unanimity in the family respecting this point. A man who could believe and unblushingly assert that at a pinch, a Methodist might possibly be saved, and perhaps even a Mohammedan, — what could he be but an abandoned wretch? For, in Norway, it is well known that it is only Lutherans who are saved, because all respectability is Lutheran. But in spite of his determination never to engage in another dispute with such a wicked man, the Judge could never refrain from throwing down the gauntlet to his son at the dinner-table; and when his arguments (on the irrefutability of which he had privately prided himself) were ruthlessly demolished, he would jump up and pace the floor with excited gestures and at last sink down exhausted in a sofa, while the women with anxious faces fanned him and gave him brandy and consulted in whispers about the propriety of sending for the doctor. The glances which on such occasions they sent Harold over their shoulders were by no means pleasant, and the contemptuous imperturbability with which he received them only deepened their conviction regarding his inherent depravity. A man who would not abandon his wicked sentiments, even though he saw that they made his father ill, must be bereft of every vestige of human feeling.

It was one evening after such a dispute that he went roaming discontentedly along the beach; his restless spirit chafed against its bars, and he looked with defiant longing toward the mountain-tops behind which the great wide world spread out so gloriously. There was a soft summer twilight diffused beneath the sky, but the western horizon was still bright and the forest traced a black jagged line against the afterglow of the sunset. The surf was high, and the thunder of its retreat went rumbling through the rocky caverns with a mighty roar. He stood still for a long time and listened; along the whole line of the coast this tremendous cannonading was at this moment going on. The thought somehow soothed him; he sat down upon a stone and leaned his head upon his hands; it was Nature's tumultuous lullaby to his grief; all cares seemed evanescent in the presence of this mighty voice. And yet of what avail was it to persevere in a struggle which brought suffering, ever renewed; and joy to no one? Was there any duty which could bind a man to a life which thus daily crippled his growth and paralyzed his energy? No, he would rebel; he would break his chains, he would defy heaven itself rather than submit to this gradual smothering in reproachful kindness, this silent condemnation on one side and outspoken tyranny on the other. A pair of cormorants were fighting with harsh screams on the ledge of the rock above him, and tufts of black feathers were blown past him, whirling fantastically in the breeze. He glanced up and watched their combat with a fierce sympathy; that was, at least, an honest way of deciding a difference. The screams grew louder, and a curious crowd of gulls and auks gathered around to enjoy the sport. They whirled in snowy eddies about the crag and flapped, screaming, their large wings, now nearly touching the contestants, now again drifting seaward in wide elliptical lines, and ever again returning. With every moment the sympathetic commotion grew wilder, until suddenly a great black bird came tumbling down the ledges of the rock, and fell helplessly among the stones. The other rose triumphantly into the air, followed by a clamorous crowd of admirers. Harold arose and picked up the bleeding cormorant, which was half stunned by the fall, and from an impulse of pity thrust his knife into its heart. Then he flung it at his feet and gazed mournfully at it.

"It is no use disguising it," he murmured; "father and I, even if we never come to blows, are as deadly to each other's peace and happiness as were these birds in their blind fury. I don't know if the quick murder is not preferable to the slow and gradual one."

He sat long pondering, clenching his fists instinctively at the thought of the indignities he had silently suffered.

"No, by Jupiter! I will stand it no longer," he cried, springing up and shaking his fist against the sky. "I will go away this very night, and the farther the better."

Fired with resolution, he turned hotly about; then paused with an exclamation of wonder. He found himself face to face with a young girl,—a slender, delicate thing, with large blue child-eyes and blonde hair which fell smoothly over a pale, narrow forehead.

"Hilda," he cried, "what are you doing out so late?"

"I saw the cormorants fight," she said breathlessly; "I came to separate them. I ran with all my might, but I came too late."

He could not help smiling at her eagerness.

"Why did you want to separate them?" he asked kindly.

"Why, of course, because it is wicked to fight, and because I didn't want the poor bird to get hurt."

"Which one?"

"The one that was most hurt; the one that is dead."

"But how do you know but that he may have been the one that commenced the fight?"

"I don't care," she answered with a pretty pout which expressed contempt for his logic. "I don't like any one to be hurt, whether he deserves it or not."

He smiled again as one smiles at an amusing child.

"You are in that respect different from most creatures, Hilda," he said. "Look at all that sycophantic crowd of gulls and auks, how they are screaming themselves hoarse, celebrating the victor, while no one troubles himself about the poor rascal who lies dead there on the sand."

"Yes, I trouble myself about him," she answered, stooping down and patting the dead bird. "Poor thing, how shockingly he has been maltreated! I care for every one who suffers," she added commiseratingly, as if addressing the cormorant; "if I had my way, no one should be permitted to strike or maltreat any one."

He scarcely listened to what she said, but stood regarding her pretty stooping figure with compassionate interest.

"If you care for those who suffer, Hilda," he said with a sort of mournful flippancy, "then you ought to be very fond of me. I have a bad time of it."

"Have you?" she asked, looking up dubiously, as if questioning whether he was in earnest. "I thought you were rather — rather —"

She paused and looked away in embarrassment.

"Now, out with it: you thought I was a bad lot; wasn't that it?"

"No, not exactly that," she protested feebly and with increasing bewilderment, "but — but —"

"But something very near to it," he supplied, smiling. "Is that what they have told you?"

She stood shifting her weight from one foot to the other and looking anxiously over her shoulder, as if watching for a chance to run.

"I wish you wouldn't ask me such questions," she said, with little gasps between each word, like an excited child. "Good-night!"

"Hold on a minute," he responded, seizing her gently by the arm. "You needn't be afraid of me; I sha'n't bite you. Now sit down here on this stone and talk with me. I am a very harmless fellow, I assure you."

She yielded to his strength rather than to his words, and seated herself timidly upon the stone. "They have been telling tales about me to you, Hilda," he said, stooping down to catch the glance of her eye; "my sister Catherine has told you that I am violent, hard, and unfeeling; is it not so?"

"She has told me that you contradict your father," answered the girl evasively. "But it isn't she alone. Everybody says you are such a wild fellow."

"Well, if everybody says it, I suppose it must be true," he muttered sadly. "But I was born that way, Hilda. I am a sort of an Ishmael whose hand is against everybody and everybody's hand against him. But I thought you were not like the rest, and that was the reason I spoke to you, and held you back when you tried to run away."

He was a little ashamed of making such a bare-faced bid for her sympathy, but he was determined to win her good-will, and in so good a cause a little stratagem might well be excusable. The fact was, the barrenness of his life had become oppressively apparent, and a hunger for sympathy had taken possession of him. As he sat gazing into the clear, bright face of the girl, with its dimpled roundness and large frank child-eyes, he marveled at his own obtuseness in having never before discovered its attractiveness. He knew that in this unawakened nature there was a fund of sweet devotion, which, in all likelihood, would be given to him who should be the first to demand it. To maidens of this type there can be no question of choosing; like the wild flowers by the wayside, they passively allow themselves to be chosen. But to Harold this willing surrender was so touchingly virginal, it

seemed to heighten rather than diminish the delights of the choice.

They had been silent for several minutes, but the thunder of the surf filled the silence and made it unnoticeable. She sat leaning forward, with her hands folded in her lap and her head thrown backward. She was beginning to feel at ease and her timidity had vanished.

"Do you know," she said, turning suddenly toward him, "that Lars the shoemaker's wife had twins yesterday and they had no clothes for the poor little things, and they would surely have taken their death of cold, if they hadn't had a basket of carded wool; and when I was up there this morning it was the funniest thing to see the two little brown shriveled-up things burrowing about like kittens in a basket of wool. Mother and I have been at work all day piecing things together for them, and I had just been up there with food and clothes when I saw the cormorants fighting and stumbled upon you."

"Why, that was very extraordinary," he remarked, with an effort to appear interested.

"Extraordinary? Why, not at all; it is the commonest thing in the world. The people here are so very poor, you know; to feed and clothe the living is about all they can do; and the women have to work so hard that they have no time to make preparations for the unborn."

The wholly impersonal candor with which she spoke amused and yet touched him, and her utter unconsciousness that the subject she had chosen for their conversation was, to say the least, unconventional, placed her innocence in a new and bewildering light. It was odd that her mother and father, who were both (in a rural way) cultivated people, had not given her some idea of the world's etiquette. But then, of course, the world was so remote from their secluded little valley, and they themselves had been so long away from it that probably the necessities of the hour, rather than deference for the social ideals of their youth, shaped their duty, speech, and intercourse.

He must have allowed his features to express some of the wonder which he felt; for she suddenly paused in her rapid narrative and remarked dubiously, "Of course, you know Lars the shoemaker."

No, he had been so long away from home that he had no longer any vivid recollection of Lars the shoemaker.

"Why, is it possible?" she cried in astonishment. "Why, he remembers you perfectly. He used to make your shoes always when you were a little boy; and he just told me that you were terribly hard on shoes. 'I'd rather make boots for a yearling colt,' he said, 'than for that harum-scarum lad of the Judge's.'"

"Why, he was pleased to be complimentary," said Harold laughing.

"No, not at all," she replied with amusing literalness; "he has nothing against you, of course, now, because it is so long ago; but the Judge used to scold him and use very hard language to him because you wore your shoes out so rapidly."

Harold was about to say that he was much obliged to Lars for bearing him no ill-will for his treatment of his boots, but a regard for her feelings, which were as genuine as they were transparent, checked his tongue. Her interest in the twins and the importance she attached to their father's opinions added two fresh touches to her character, which now stood out in his mind with charming completeness. She needed now no further encouragement to talk. She chattered on with delightful vivacity about Thore Gimlemo, who believed that his wife was possessed by the devil, and put her, head foremost, into a tub of cold water in order to make it as uncomfortable as possible for the evil spirit, until the poor woman was well-nigh drowned; about Mikkel Ramstuen's wife, who was a witch and had been seen riding across the sky on a broomstick, and Truls Ostmarken, who had fallen in love with a gypsy girl and had given up house and home and joined the gypsies. Wasn't it terrible? And his poor mother, they say it broke her heart. She had been around to console her, and had read her the chapter in the Bible about him who hateth not father and mother and son and daughter for my sake is not worthy of me; but she had taken on at such a rate that she (Hilda) had been frightened, and had gone away, although her conscience had since sorely accused her. She meant to go up to the farm in a day or two and comfort the poor woman again, hoping that by that time she would be more resigned.

In this strain she chatted away for nearly an hour, he throwing in an occasional monosyllable, or a tentative remark which was calculated to stimulate her garrulity when it showed signs of flagging. But through all her inconsequent talk there ran a vein of philanthropic sentiment which animated the homeliest details and made them appear beautiful. He saw her in spirit, like a bright ministering angel, moving among the poor, the sick, and the unhappy, cheering them with her sunny voice and her ever-ready sympathy. And what was sweetest of all, she was animated by no heroic feeling, and quite incapable of understanding what such a feeling meant; she was conscious of no lofty mission, but followed unreflectingly the impulses of a kindly heart and a helpful nature. Even her little excursions beyond the bound-

daries of convention seemed part of the same impulsive and lovable nature, and deepened his respect for her.

They walked home together in the twilight, he accompanying her to the gate of the parsonage.

"Your father does not approve of me, I believe," he said, as he pressed her hand in parting, "or I should call upon you to-morrow."

"But I will make him approve of you," she answered confidently. "He calls me his little tyrant, and I think he is right. I always make him think as I do. If he didn't, I would refuse to iron his fluted ruff. I am the only one in the house who can do it properly."

"Why, you are a terrible tyrant — a regular Nero."

"A regular what?"

"A regular turtle-dove."

"No, that is not what I am," she responded with innocent earnestness; "but do you know what of all things I should like to be?"

"I have no idea."

"The good fairy in the story-book who steals in unseen, and stoops over the baby in the cradle, kisses it, and lavishes her good gifts upon it."

"And can you guess what I would like to be?"

"No; tell me."

"The baby in the cradle."

She did not at once comprehend his meaning, but as it dawned upon her, the blood mounted slowly to her cheeks and spread over her neck and forehead. She dropped her eyes, but in a moment conquered her embarrassment and met his gaze frankly.

"You should not say such things to me," she whispered a little tremulously; "father would not approve of it."

"But you can make him approve of it," he cried, laughing. "There is always the fluted ruff." And lifting his hat he hastened away.

II.

AFTER that first meeting scarcely a day passed that they did not meet, until the pretense of accident became a transparent fiction. He had not been wrong in anticipating an easy conquest. To use an expression of Schiller's, he had gently shaken the tree and the fruit had fallen, ripe and golden, into his lap. Neither was an adept in the civilized art of flirtation, and the serious dénouement of the affair had been visible to both of them from the beginning. Therefore when the proposal came it caused her no surprise, but only a little maidenly flutter; and she yielded to his caresses shyly, yet with a luxurious sense of

surrender, humility, and utter self-effacement. She gloried in his protecting air, his masculine ease and superiority, his calm security in the possession of her love. She laughed and wept with joy when he conducted her into her father's study, and holding her by the hand asked for his consent to their union; and the quiet assurance with which he met the bewildered little pastor and disposed of his faint objections filled her with pride and delight. A little harder was the battle with his own family, but even that was easier than she had anticipated. For when the Judge had conquered his first disappointment he readily persuaded himself that an early marriage (even though it were an unambitious one) was just what was needed to give his son stability of purpose and drive the revolutionary whims out of his brain. And when he had reflected sufficiently, he began to congratulate himself on this unexpected turn of affairs, and only marveled that he had not himself had the ingenuity to devise so simple a remedy. Harold was already gentler and more tractable than he had been; there could be no doubt that marriage would still further improve him.

"With wife, children, and property, no man can afford to be a radical," said the Judge, rubbing his hands contentedly; "and Harold will soon be well ballasted with all these blessings. I shall have the happiness before I die of seeing him a corpulent landowner, who proposes the king's health at official dinners."

This vision of his son as a stout, middle-aged dignitary, who has a salute fired from his pier whenever a high official personage passes in the steamboat, pleased the Judge exceedingly. He was quite ready to retire from the stage as soon as he should have assured himself that Harold was equipped for the responsibilities of this illustrious rôle. In spirit he saw Harold decorated with red ribbons and stars, seated on the platform on public occasions, or advancing in dress-coat and white kid gloves to shake hands with His Royal Highness Prince So-and-so, or His Reverence the Bishop when he made his annual visit to the parish. The Judge was himself rich and influential, and there was nothing in the way of official honors which his son might not legitimately aspire to, as soon as he should have completed his legal studies. Nor was the old gentleman in the depth of his heart unaware of the fact that his son was more richly endowed than himself; and it was therefore the more important that he should be made to employ his talents in the cause of conservatism and oligarchic government. Collecting rents and dining traveling magnates seem, to men of his ilk, the most dignified occupation to which genius can aspire.

The wedding was celebrated with more pomp and ceremony than were agreeable either to bridegroom or bride; but as tradition prescribed how weddings in the Gamborg family were to be conducted, and the parson by a very liberal check was indemnified for his outlay, there was no one who had the courage to grumble. Hilda in a satin dress, which had once been white, but was now yellow with age, and laces which had adorned half a dozen of Harold's ancestresses, was so overpowered by her own magnificence that she scarcely dared breathe. She had to pinch her arm in order to convince her dazed mind that she was really herself; her individuality seemed so completely merged in the august family into which she had entered, that she felt like a mere ghostly personification of the bridal character—the typical Gamborg bride. She was not the first of the series, nor was she likely to be the last; and like her predecessors she was not above wishing that the original bride for whom this venerable gown had been made had possessed an ampler waist, which would have made respiration a less hazardous experiment. But sufferings endured in so great a cause are never without their compensation; she began to feel an added respect for herself as joint heir to all the venerable traditions which gave luster to the Gamborg name. Nevertheless, the transition from homespun to satin had been too abrupt not to involve a considerable degree of discomfort; and as the long and eventful day lagged toward its close, she yearned more and more ardently for an escape into her wonted deshabille.

The daily routine of life in great families is often a very dull one; dullness seems, in fact, a kind of dignified historical attribute of greatness. In the intolerable leisure with which she was burdened as a member of her father-in-law's household, she had abundant time and opportunity to reflect upon the distinction which had been conferred upon her; and the women of the household were ever ready to furnish food for that species of reflection. She was not permitted to resume her former free-and-easy habits, roaming around the valley on charitable errands, and what they were pleased to call the quixotic streak in her nature was by daily admonitions systematically repressed. Her pauper friends and dependents could no longer be reached except through the formidable machinery of subordinates which the great house provided, and every generous impulse was strangled in an intricate web of proprieties. Her husband, who seemed to be earnestly striving to please his parents, was deeply absorbed in his study of law, and when he was with her he displayed

a nervous restlessness which she was at a loss to account for. It was evident that something was smoldering within him which he was vainly endeavoring to repress; and when she began to talk with the hope of diverting him, she made the humiliating discovery that she had lost the power to entertain him. Her harmless gossip, which once he had found so amusing, struck him now as trivial, and he had not the grace to conceal the fact that he was bored. He made once or twice the attempt to discuss with her his aspirations toward a freer and wider sphere of activity, and gave vehement expression to his impatience with the traditional barriers which here on all sides hemmed him in; but she only gazed at him in childlike wonder, then with a sense of insecurity as if she feared that his reason was affected. Her little circumscribed soul had never felt any longing beyond its round of daily duties, and she could not comprehend why any one who was kindly treated and suffered neither from cold nor hunger should yearn for foolish and unattainable things. In her simple, practical life there had been no room for sentimental sufferings, and accordingly no sympathy with afflictions of such an intangible order. She insisted upon finding physical causes for her husband's discontent, and he submitted with a sort of humorous despair to being coddled with elder-tea, Hoffman's anodyne, and mustard-leaves, rather than go to the trouble of explaining to her what he knew would be unexplainable. In some respects she was a stronger character than he, and under her playful tyranny veiled inflexible little purposes, which she invariably carried out. They had, however, this in their favor, that they were always for somebody else's benefit. Paradoxical as it may sound, she had lived so long in others that she had ceased to take any vital interest in herself. She derived all her gratifications, as it were, second-hand, through her interest in the lives of those who closely or remotely touched her own. She had from her childhood managed in this benevolent fashion her father and mother, and every one else who had come in contact with her, and it was therefore a constant discomfort to her to feel her superfluity in the Gamborg household, where there were already managers more skilled than herself, whom she could not hope to deprive of their power. She took her revenge in an innocent fashion, by contemplating the time when the reins should have been handed to Harold, who, of course, in turn would hand them to her. The only cloud upon this radiant vision was her dread that Harold might possibly have a screw loose, and thus be ill qualified for succeeding to the family power and dig-

nity. He certainly did act and talk strangely; and she had once seen him stand on the balcony, after a slight dispute with his father, shaking his clenched fist against the sky. A cold shudder had run over her at the time; she had not dared to ask him for an explanation, for fear that the explanation might prove even more irrational than the act. And yet, when she thought proudly of herself in her housewifely dignity, with a lace cap on her head and a large bunch of keys depending from her waist, she found her hopes for Harold drifting in the same direction as those of his father, and she pictured him fondly as a stout patriarch in a judge's uniform, dispensing justice with a mild and firm hand. A large flock of blonde-haired, blue-eyed children invariably stole into this picture; and she punished them in spirit when they were naughty, for she was a firm believer in discipline, and patted their little yellow heads to comfort them in their childish griefs. When finally number one of this long procession arrived, there was great rejoicing in the Judge's house, although the mother found it hard to reconcile herself to the fact that it was a girl. In her reveries number one had always been a boy, and as she had already become well acquainted with this imaginary son, and had arranged his whole future for him, it seemed cruel in him to disappoint her. She had a much higher regard for boys than for girls, and had always championed the male valiantly against his detractors.

III.

IN the autumn of 187-, when Harold's daughter was two months old, some apprehension was felt in the valley that the world was coming to an end. And it was true; the world was coming to an end — the old feudal world, with its rigid class distinctions, its gold-laced, star-spangled officials, its pharisaism, oppression, and absolute vetoes. There was a great ado in the valley — Björnson was coming; Björnson, the people's champion, Björnson, the King's enemy; Björnson, the poet, the orator, the republican. The exciting message ran from mouth to mouth; and people who had never been supposed to have an opinion suddenly straightened themselves up and spoke like men. Peasants who had stood at the roadside, hat in hand, when the Judge or the pastor was passing, now kept their hats on and only nodded. Stooping heads were lifted, round backs grew straighter, shambling gaits firmer. There was something inspiring in the message, which awakened many a dormant mind, and rekindled the manhood in humble souls. Apathy grew into discon-

tent; discontent into aspirations and resolves. Men gathered in groups at court, at weddings and funerals, and especially on the church green, to discuss the attitude of Parliament and the King's claim to an absolute veto. There was but one voice — they would stand by their representatives, and defy the King. Their history furnished enough of precedents for such action, while it furnished none for submission. They would give Björnson a rousing welcome, and they would do as he said; they would take courage and elect an Opposition candidate for the Storting. The excitement grew in widening rings, and ruffled at last the peace of the Judge's cozy dining-room. It was told that some of his tenants meant to qualify as voters by having worthless marsh-land deeded to them. The Judge had himself cordially approved of the proposition, and had even helped them to obtain the land, taking it for granted that they would vote with the Government. But now it was told that they were Björnsonians, and talked bitterly of the King. It was at dinner that the Judge, as usual, gave vent to his indignation at this treachery, and announced his intention to discharge from his employ every one of his subordinates who dared vote for the Opposition. He felt so sure of the approval of every one present that words seemed scarcely necessary; and yet he could not help noticing that while every one else applauded, Harold remained silent.

"Well, Harold," he said, turning with ill-concealed irritation to his son, "you were a loud enough declaimer on politics formerly; how is it that you have suddenly lost the use of your tongue?"

"Because I don't agree with you, father," answered Harold quietly.

"What! don't agree with me? You gosling, you! You mean perhaps to say that you disapprove of my intention to punish my recreant tenants?"

"I do," replied the son imperturbably.

The Judge put down his wine-glass with such force that half of its contents was spilled on the table. He pinched his eyes together with a malicious expression and clinched his teeth. He could have crushed his son. He hated him. But the presence of guests restrained him from any act of violence.

"Perhaps you would favor us with the conclusions at which your wisdom has arrived," he observed with forced self-command.

"With pleasure." But just as he had raised his head to speak, Harold met a pair of blue eyes fixed imploringly upon him. He understood what they meant, and resolved to ignore his father's sarcasm.

"I am afraid," he said, suddenly checking himself, "that our views are so widely divergent that discussion would only arouse ill feeling, and, moreover, be profitless."

"Ah, indeed, I expected that," was his father's mocking reply. "Where arguments would fail, cowardice comes to the rescue."

There was a moment of painful silence, and it was a relief when somebody had the kindness to choke, whereupon his neighbor gave him a slap on the back, thereby giving a pretext for much forced hilarity. Harold meanwhile had risen and left the table. His wife, to whom his movement was unexpected, also half rose from her chair, but after a brief hesitation again seated herself. It would look too much like a demonstration, she thought; and her father-in-law, although he was not averse to making scenes himself, thought sensational conduct very ill-bred in others. In the next moment, however, she regretted her prudence; her heart ached for Harold; and yet, although it grieved her to think that he was unhappy, she could not quite in her heart of hearts approve of his rebellious attitude toward his father. Why did he for the sake of mere opinions — things which were of no earthly consequence to anybody — offend the old gentleman, who was evidently willing enough to be kind to him, but could not bear to be contradicted? Why not humor him and say "yea," which was always much easier than saying "nay" and provoking ill feeling and discussion? Thus reasoned the sage little Hilda while her husband was marching along the beach through a howling storm, nursing wild and desperate thoughts.

It was the day after this episode that Judge Gamborg surprised the parish by announcing himself as a candidate for the Storting. Pressure had been brought to bear upon him, it was said, from high official quarters, but he had hesitated to assume the responsibility until last night, when he had arrived at a sudden resolution.

He felt a vast fund of force within him, and he was resolved to expend it at whatever sacrifice of individual comfort, in preserving the bulwarks of society and combating the dangerous elements which were beginning to assert themselves in the country. In quelling rebellion in society at large he would also put an end to it in his own home. By family tradition, by talent and social eminence, he was pointed out as the man to lift the Conservative banner and lead it to victory. There was an immense agitation in the parish. The pastor preached political sermons Sunday after Sunday, and demonstrated clearly that a number of Biblical tests had been inspired with special reference to the present situation in Norway.

He showed that society must inevitably go to pieces if the Liberal candidate, a young peasant named Thorald Berg, was elected; and he proved from the Bible that no man could be a Liberal and a Christian at the same time. In fact, he identified the cause of Christianity so absolutely with that of Judge Gamborg and conservatism that there seemed no escape from the conclusion that it was the fate of Christianity rather than that of the ministry Stang which was to be decided at the impending election. The Judge, who sat tall and imposing in his front pew, approved highly of these discourses, and repeated the gist of them at dinner for the benefit of one member of his family who had hoped to escape them by remaining at home.

Harold, under the influence of his wife, had been as neutral as possible during the last weeks, and had avoided all chances of collision with his father. He understood perfectly well that it was animosity to himself, a stubborn determination to assert his sway, which had induced the latter to accept the nomination for the Storting. But consideration for his wife and child and his own future — considerations which were constantly being urged upon him by the wife in question — made him curb his rebellious temper and tame his eager tongue. He had just succeeded in convincing himself that this submission to the inevitable was the part of prudence and not necessarily ignoble, when the name of Björnson rang through the valley, and the wild cheering from the steamboat landing announced to him the arrival of the great orator. He put on his hat and walked disconsolately up the hill-side toward the forest, in order to be as far away from temptation as possible. But the cheering pursued him, floating clearly through the still mountain air, which carries distant sound with wonderful distinctness. Several times he paused, wrestled with himself, and again continued his dismal march. Whenever, drawn by the alluring sound, he turned about and his purpose began to waver, he seemed to see his young fair wife, with her babe in her arms, standing in the road, barring the downward path. He was now close up to the forest; it was early in the day, and the sun was but a few hours above the eastern mountain-tops. He sat down upon the stump of a felled tree, and gazed out upon the beautiful fiord-valley. The air was teeming with sunshine; the fiord lay smooth and glittering in the bright light, and the huge inverted mountain-cones shone with their snowy peaks in its depth. The angel of peace was abroad; all nature rested in blessed security. The seagulls drifted lazily above the water; the patient fishermen sat in their boats gazing down into

the green luminous deep, where the fishes moved placidly among the stones and the pale, filmy seaweeds which swayed gently with the passing current. Round about stood the mountains, in hoary majesty, stern and immovable as they had stood for centuries past; but down on the pier stood a few hundred men, shouting themselves hoarse over an innovator who had come to disturb this blessed peace. Was there not, perhaps, some truth in the pastor's perpetual admonition that peace was the highest of all earthly blessings, for which reason Christ was called the Prince of Peace? Was it right to arouse discontent and aspiration in the bosom of men who had hitherto cherished no higher desire than to have enough to eat while they lived and to go to heaven when they died? Æsthetically that little band of roaring enthusiasts down on the pier were a discordant phenomenon, and marred the harmony of a perfect day. Harold looked out over the wide fields of waving wheat; he saw the tall chimneys of the stately mansion which would in time be his; and a sensation which had hitherto been alien to his nature gently stole over him. It was the indolence of possession, the rich man's repugnance to change. He began to comprehend his father's animosity to Björnson and his progressive followers, and he saw himself, in spirit, as the proprietor of his inherited estate, perpetuating the benevolent despotism of his predecessors. The cheering of the crowd came floating faintly up to him; Björnson had made a speech; hats were thrown into the air, and the shouting would have no end.

At this moment his reflections were interrupted by the sound of hoof-beats near by. He looked up and saw his father riding slowly along the bridle-path which led up into the glen. It was an unusual thing for the Judge to be out riding at this time of the day, and it was still more extraordinary for him to depart from the beaten highway. The Judge liked to be seen, and professed no love for nature in her uncultured state. It was therefore obvious that he was running away from Björnson, or rather from the irritation which it would cause him to see the obnoxious orator received with homage and honor. The scene on the pier had given him a foretaste of what was in store for him, and he had concluded that his temper could not bear the strain of more such demonstrations. The sight of his son, whom he suspected of sympathizing with the agitator, did not under such circumstances affect him pleasantly.

"What are you doing here?" he asked gruffly; "admiring the landscape?"

"Yes."

"Admiring fiddlesticks! Why don't you go down to your friend there and give him a fitting reception?"

"I hadn't thought of it, but if you are anxious to have me go, I will have my name put on the committee."

The Judge had longed for a provocation to lose his temper, and Harold's answer served his purpose.

"I tell you, boy," he cried, growing purple in his face, "that I am in no joking humor to-day; and I warn you, once for all, that if you dare to go near that fellow while he is here in the parish, I shall—I shall whip you as if you were a stripling. He ought to be in the penitentiary instead of being permitted to range round the country, insulting the King and inciting the people to disregard their superiors and despise their betters."

Harold sat for a moment still, gazing fixedly into the air. Then he arose and walked quietly down the hill-side.

"Where are you going?" cried his father after him.

"Away."

"If you dare disobey me —" The Judge's voice failed him, and with a hoarse shout of wrath, he broke into a paroxysm of coughing.

"That remains to be seen," answered the son, striding across the fields toward the farm where Björnson was to hold his meeting.

IV.

HAROLD walked on with large steps, seeing nothing, hearing nothing, and only conscious of one defiant purpose: to assert his independence against such unbearable tyranny. By one angry wave of feeling all his conservatism had been swept away, and he burned to speak out loudly and freely the convictions which he cherished, and which had given dignity to his life. He wished to commit himself irretrievably as a safeguard against further attacks of cowardice. Wife and child and landed estate, for which he would but a moment ago have sold his soul, seemed now scarce a feather's weight in the balance.

It was a couple of miles to the farm where Björnson was to speak; several hundred peasants had already gathered there, and the road leading up from the pier was black with people. A platform had been erected under a great tree on the shady side of the house, and a man who, in honor of the occasion, had provided himself with an asthmatic brass horn, sent melancholy echoes careering away over the mountains. Harold took this to be a signal that the meeting was opened, and he redoubled his speed. He saw Björnson ascend the platform, and heard the cheering break out afresh. No one

noticed the young student as he approached within hearing distance, but as he pressed eagerly forward people gazed at him in astonishment and made way for him; and yet from the looks they sent him he perceived that they were animated by no friendly feelings toward him; it was but a remnant of the innate respect which they had been accustomed to show to "gentlefolks."

"Look there," he heard some one saying behind him; "there is the Judge's Harold. I bet he means mischief."

"I scarcely think so," answered the one addressed. "He used to be a lively chap when he was a boy. But the old man has taken the spunk out of him. They say he thrashes him yet."

With blazing eyes Harold turned around and glared at the men; but they returned his gaze quietly and seemed in no wise disturbed. They felt their power-to-day and the dignity of power. The orator had now fairly warmed up to his subject; he paced up and down the platform, tossing his blonde mane of hair back from his forehead, flinging forth laconic sentences which clung to the memory like burrs. Then the words came thicker and faster, and his voice rang now softly and persuasively, now sharp and inspiring like a battle-cry. Harold stood riveted to the spot. His whole soul was aroused; he trembled with delight. It seemed inconceivable to him that he ever, even in thought, could have been unfaithful. There breathed a warm, all-embracing love for humanity through the orator's words, and it was this which touched Harold and made him feel his own unworthiness. What had, in times past, inspired his defiance to the paternal authority, had been a mere personal resentment, and perhaps a vague, youthful enthusiasm for great but half-comprehended ideas. But this man's speech throbbed with a nobler passion. Here were no vague moonshiny ideals, but definite purposes rationally conceived and eloquently elucidated. It was glorious to hear this rushing cataract of speech, plunging resistlessly onward, carrying the listener along on its mighty current. In his narrow and cramped life, hedged in by a Chinese wall of traditional proprieties, through which no large idea could penetrate, how often, oh, how often he had hungered for a breath from that fresh world of thought in which he had moved during his student days! And here, as by a miracle, he was suddenly in the midst of it. It blew and hummed about him like strong summer breezes, alluring his soul with bewildering melody.

For two hours Björnson spoke, and the peasants stood or sat in groups in the grass listening with thoughtful faces, and now and

then with quiet nods of approval. But Harold, in whose breast the mighty words had aroused a storm of emotion, stood gazing with an excited expression at the orator's face, and no sooner had the word been declared free than he sprang upon the platform. A murmur of displeasure ran through the assembly.

"Down with him!" cried some.

"No, let him speak!" shouted others. "Let us have fair play."

And Harold spoke. The flood-gates of speech had been opened within him, and his words came with a glorious spontaneity and force; thoughts large and radiant tumbled forward, one pressing hard upon the other; and the world, as it lay shimmering at his feet, seemed an ocean of light. The crowd was at first dumfounded. "Isn't this Harold, the Judge's son?" they asked, marveling. Yes, surely, it was Harold, the Judge's son; he was speaking apparently against his own father.

"The candidate of the right," he was saying, "worthy and honorable as he is, could in no sense really represent this district, for he knows not its people, does not sympathize with its wants, is remote from its aspirations. He is by birth, by character and position, wedded to the ancient oligarchic régime which it is your duty and your privilege to overthrow. Take courage, then, and vote honestly and fearlessly, allowing no external consideration to restrain the free expression of your choice."

A great cheering here interrupted the speaker; for it was well known throughout the valley that the Judge had threatened all his tenants with the loss of their holdings in case they dared to vote against him, and that upon the so-called "marshmen," whom he had himself helped to qualify as voters, he had exercised all the restraint in his power. That the son had disapproved of these arbitrary proceedings had also been vaguely surmised, but that he should dare stand up in public and enter the lists against him upon whom his whole future depended was more than any one had expected. Nevertheless it seemed a great and courageous deed, and excited universal admiration; for no one doubted what was in store for the young man when he should have returned to the paternal mansion. Harold, however, was little troubled by such considerations. The longer he spoke, the more eloquent he became, the more persuasive grew his voice, and the more forcible his argument. For all the time this thought burned within him: "I have been unfaithful, and I will do penance for my unfaithfulness. I will cut off my retreat into the land of indolent

security and ease. I will stand by my colors. I will be true to myself and take the consequences."

The meeting lasted until late in the afternoon. Wherever Harold went he was met by friendly glances and hearty words. Many pressed up to him to shake his hand. The distrust with which they had viewed him as a member of that official bureaucracy which sits like a huge nightmare upon Norway's breast, impeding her breath and smothering her cries, had suddenly vanished, and for the first time they looked upon him as one of their own. And he, too, felt a warm sense of fellowship spreading beneficently through his soul; he felt himself free and happy, and he felt, what had been a mere empty phrase to him before, that he was a Norseman. He walked about with Björnson, and talked with him as he had never talked with any man before; for he had never before known the happiness of being completely understood. He laid his soul bare before him, and went away with a new strength and trust throbbing through his being. He knew now a man cast in the heroic mold—a poet, a prophet, a warrior. A great liking had sprung up between them; they had felt strongly drawn to each other from the first moment. And when Harold went to face his father's wrath, something like a consecration seemed to have descended upon him, hallowing his life to a great and noble work.

A drowsy red light was spreading from the late sun over fiord and valley, as Harold in his exalted mood marched slowly homeward. There was something strangely unreal in the long-familiar scene, as if he had waked from a dream the vividness of which made reality seem pale and phantasmal. Everything was hushed, water and air were oppressively still; but it was not the spontaneous stillness of sleep, but a sultry silence which rested heavily upon the sense. It was as if Nature were holding her breath. A foreboding of a catastrophe of some sort took possession of Harold; yet his courage in no wise deserted him. He saw in the anxious look of his wife, who stood waiting for him at the garden gate, that the story of his exploits had preceded him, and that he would thus be spared the trouble of explaining.

"O Harold!" she cried tremulously, running to meet him, "don't let father see you. He is furious with you, and there is no knowing what he might do should he find you to-night. The sheriff was here an hour ago, and he has told him something that has incensed him terribly."

They were standing in the shadow of a great walnut-tree at the entrance to the gar-

den. She put her arms about his neck and clung to him weeping.

"You will never do such a thing again, Harold dear," she said imploringly. "For my sake, for baby's sake, you will not do it."

He stood for a minute pondering, "Listen, Hilda," he said at last firmly, "henceforth you must make up your mind whether you will follow me or father. I have my work too in the world, and whether it leads to poverty and shame or to wealth and honor, I have no choice but to do it."

"Oh, that is that horrid Björnson," she cried, bursting into a fresh fit of weeping. "I know that hateful spirit which I have so long tried to quell in you, and now he has come and undone it all. We were so happy until he came."

"You may have been happy," he answered sternly; "I was miserable."

"But baby, Harold, baby!" she exclaimed with a pitiful appeal; "what is to become of baby if you break with father?"

"It will have an honest man for a father instead of a knave."

"Do you call your father a knave?" she ejaculated, gazing at him in horror.

"No, child, no! He may be honest enough, but I could scarcely continue to please him without being a knave. I am appalled to think how I have day by day lapsed from my true standard of rectitude, how I have dragged my manhood in the dirt, how I have become degraded and contemptible in my own eyes, and all in order to please my father. Now I have done with all that; henceforth I intend to please myself."

He spoke with a half-suppressed vehemence which fairly frightened her. He had always been gentle in her presence, and she had insensibly come to look upon him as an easy subject for management. She drew back from him now and regarded him with an air of reproachful dignity.

"What terrible riddles you utter," she said, shaking her head. "An evil spirit has taken possession of you, and it is useless to talk to you. Only one thing I must beg of you, for your own good, and that is to ask father's pardon, in case I can induce him to forgive you on that condition. If you will go over to the parsonage and sleep there to-night, I know I can get everything arranged by to-morrow morning."

It would have been amusing, if it had not been sad, to see her implicit trust in her own little shallow arts of management. Men were born to make trouble in the world, she reasoned, and it was the province of women by their superior diplomatic subtlety to smooth things over and reestablish pleasant relations.

The principles which were at stake she calmly ignored as little more than twaddle, fixing her mind the more intently upon the only important issue—the reëstablishment of domestic peace upon the easiest conditions. The grunt of impatience with which her husband greeted her benevolent proposition convinced her still further of the correctness of her view; but perceiving that reasoning would be of no avail, she resolved to resort to a much more effective weapon—tender cajolery. But unfortunately she had not yet devised a natural transition to affectionate tactics, when heavy footsteps were heard on the gravel, and the Judge's portly figure was seen looming up among the flower-beds and the blooming hawthorn hedges.

"Run, Harold," she whispered imploringly; "for God's sake, run."

"I shall not run," answered Harold stubbornly.

"But he might strike you, dearest," she continued in the same anxious voice, sinking down upon her knees and smothering her rising sobs. "He is in such a terrible rage."

He made no answer, but, disengaging himself from her arms, stepped out from the shadow of the tree and faced his father. The old gentleman did not at once see him; he was standing in the gravel walk, meditatively decapitating an aster with his riding-whip. He expended a good deal of energy in the operation, as if giving vent to a latent animosity. As he caught sight of his son standing but a few feet from him, he gave a start, and clutching his riding-whip tightly, advanced a step; then, at the sight of Hilda, forcibly restrained himself.

"Go into the house, Hilda," he commanded sternly. "I wish to speak alone with— with— this gentleman here."

"No, I will not go away," she replied excitedly; "I won't let you hurt Harold, and I know that is what you intend to do."

The Judge, disdaining to reply, turned to his son with a peering, malicious look, and remarked in an ominously pleasant tone: "You have been distinguishing yourself, I am told, as a patriotic orator. You spoke, I believe, against your father, whom you described as a scamp, and an unscrupulous monster who restrained the dear innocent peasants from the rightful exercise of their suffrage. Wasn't that it?"

"It is true and not true," answered the son, leaning with folded arms against the tree. "I said nothing about you that I have not already said to you."

"Ah, how very good of you!" The Judge here drew a step nearer, holding with a tremulous grasp the whip-handle, which shook

perceptibly in his hand. "And I too will do nothing of which I have not already given you warning. You know what I promised."

Here he darted forward with the whip raised above his head, but in the same instant Hilda had flung herself upon her husband's neck, shielding him with her body. Harold remained immovable; he had lifted his arm to ward off the blow, but his face betrayed neither fear nor anger.

"I give you warning, father," he said, with slow and solemn emphasis, "that if you dare strike, it is the last time you will ever see my face."

"You miserable coward," cried the old man, suddenly losing control of himself, "if you think the petticoats will protect you——"

And before Harold could raise his hand again, the whip whizzed about his ears, and he felt a stinging pain across his cheek and forehead. Hilda, pale and cowering, fell down upon the grass and hid her face in her hands. The Judge, anxious to reach the house before his wrath should give way to shame, strode ruthlessly across the flower-beds and was soon out of sight. Harold, too stunned, by the moral rather than the physical effect of the blow, to think, stood gazing fixedly into the air; but there was something like a veil before his eyes, and a rushing sound as of water in his ears. Half absently he touched his face, and felt a great welt extending from the left cheek across the nose to his forehead. He bowed his head and groaned; the degradation of it was terrible. His wife, at the sound of his groan, suddenly recovered herself, rose, and went toward him; but at the sight of his face she again burst into tears, put her arms caressingly about him, and kissed his swollen cheek.

"Let us go over to the parsonage, Harold," she whispered; "stay there to-night. I will go up and get baby."

"We are going farther than the parsonage, dear," he answered brokenly. "Go and get the child."

Although but dimly comprehending him, she obeyed; it was a relief to have some duty to perform which required motion. The twilight was spreading under the great trees; the sun had sunk behind the mountain-tops, but a dim yellow light lingered in the upper regions of the air and tinged the western cloud-banks. There was something feverish in this light which dazed the sense like the atmosphere of a lurid romance, in which all things seem possible. It seemed easy to Harold to take a great resolution now, a resolution which he had meditated before, but which in the broad daylight of reason had appeared wild and impossible. He would take his wife

and child to America, and there found a new home and a new existence. He had friends in Bergen of whom he could easily borrow enough money to pay their passage. A defiant exultation suddenly broke through his burning sense of wrong, as he imagined his glorious independence of thought and deed on that remote shore, where no paternal authority and no cramping traditions could reach him. He opened the garden gate, walked out upon the pier, and made a boat ready to receive his wife and child; twenty minutes elapsed before they came, and he began to grow impatient. Nearly every trace of Hilda's recent emotion had vanished, as she came bearing the child in her arms and with a valise in her disengaged hand. She was again the busy, bustling mother. The mother had conquered the wife.

"Hand me baby," he said, standing in the boat, and stretching out his hands to receive the child.

"Tell me first where you are going," she said, pausing at the top of the stairs.

"To America."

"To America!" she cried, "in an open boat!"

"We can catch the Bergen steamer which will pass here at ten. Come, there is no time to be lost."

"But, Harold, you will not — you cannot — oh, Harold, do come back to me," she wailed in irresolute despair; "father will surely forgive you."

"But I will not forgive him. Would you like to see the scene of to-day repeated?"

"No, but I cannot go with you. Think of baby in that wild, terrible America. You should sacrifice your own feelings to baby's welfare, Harold."

"Feelings! yes, feelings I can sacrifice, but not my honor, my usefulness, my self-respect. You can persuade me no more, Hilda. Will you follow me, or will you not?"

"Oh, this is cruel," she broke out with renewed vehemence. "If you could only speak, baby, and restrain your father from his terrible folly! Oh, do not leave us, Harold, do not leave us!"

"Then you will not come?"

He had seized the oar and was about to push the boat from the pier.

"Yes, stay, I will follow you!"

With reluctant steps she descended the stairs; but as he eagerly held out his arms to receive her, she turned abruptly away, and looked up toward the stately pile of masonry which traced its outline darkly against the sky.

"Oh, my God!" she moaned, "I cannot, I cannot."

With a vigorous thrust of the oar the boat flew out into the water. With an aching heart

he stood gazing at her, as the distance between them slowly widened. Then he seated himself, and the thud of his measured oar-strokes fell heavily upon Hilda's ears. A terrible sense of desolation stole over her. She wished she had chosen differently. She wished she had followed him. But something still restrained her from calling him back. As a last wild hope she sprang up the steps, and from the end of the pier held the child out over the water in her outstretched arms. "Harold!" she called with a loud voice of anguish, "Harold!"

The oar-strokes ceased for a moment, but there came no answer. The figure in the boat grew dimmer and dimmer, and faded away in the twilight.

The black hull of the steamer hove into view, paused in the middle of the fiord, shrieked dismally once, twice, thrice, and again broke a path of foam through the calm waters. Hilda hugged her child tightly to her breast, and gazed out into the thickening twilight. An empty boat came drifting seaward with the tide. She knew what that meant.

v.

A YEAR had passed since Harold's flight. It was again summer; the thrushes sang through the long light nights in the birchgroves; the lilies of the valley grew in nodding clusters, filling the mountain glens with their faint fragrance; and the meadows were bright with pansies and violets. During all this time Harold's name had rarely been mentioned in his father's house. It was understood that the Judge had forbidden it. Since his defeat for the Storting by a few dozen votes, he felt more bitterly toward his son than ever before. It was he who had encouraged rebellion among the dependents of the estate, and blasted his father's hopes of political distinction. Such unnatural crimes could not be too severely punished. It cost a considerable effort on the old gentleman's part, however, to persevere in this attitude. Once or twice, when letters came to Hilda bearing American stamps, he was sorely tempted to break his resolution. He walked nervously up and down the floor, fidgeted with his watch-chain, and cast uneasy glances toward the letter. As for the ladies, they preserved a well-studied indifference in the parlor, but the moment Hilda had retired to her own rooms Miss Catherine was sent by her mother to ascertain how the prodigal fared. And when they heard what a hard time he was having (though this could only be read between the lines), they melted toward him, and kissed the baby and cried over it. It was

evident that Harold's letters concealed more than they told; but in a half-humorous way which had the singular effect of making the three women cry, he related that he had acquired a number of new accomplishments — that, in fact, since his arrival in America he had been a coal-heaver, a brakeman on a railroad, a supernumerary in a negro minstrel show, and that now he had advanced to the position of a miner. He owned a claim in a Colorado mining camp, which might, for aught he knew, some day make him a millionaire. It was the wide range of possibility in the thing which fascinated him. He gave descriptions of the life in the camp, full of a kind of lugubrious humor with which it was his wont to cloak his wretchedness. The ladies suspected as much, but each, for fear of distressing the others, refrained from saying what she thought. Each pretended to be delighted at Harold's cheerfulness, his excellent prospects, and his "interesting mode of life," and their sham hilarity was pathetic to observe. Hardly had they separated before each burst into tears; for everybody's heart had been wondrously softened toward the prodigal since he had gone so far away, and seemed lost to them. They reproached themselves in secret for their harsh treatment of him; and the little wife, who had no harsh treatment to reproach herself with, upbraided herself bitterly for having failed him in the hour of his need, for having broken her vow made at the altar. Mrs. Gamborg, who had been one of the foremost believers in his depravity, found herself contemplating his errors in a more lenient spirit, and there were even moments in which she censured her husband for his inconsiderate severity. Of course, she would not for the world have the Judge suspect that she disapproved of his conduct; but really, that blow had opened her eyes and set her thinking. It was, after all, but the father's spirit which was revealing itself in the son, and how could it be that the same line of conduct could be laudable in the one and criminal in the other? Miss Catherine, too, began to have revelations of a similar sort, though, of course, she was too wise to let any one suspect that she was undutiful enough to disapprove of her father. Even the parson, who had preached the celebrated political sermons, began to look askance at the Judge, when he saw his daughter's pale cheeks and hushed dispirited manner, so different from her joyous energy and light-heartedness in former days.

"The line must be drawn somewhere," he remarked to his wife, who always cordially agreed with him; "parental authority is no longer unlimited; and to strike a grown-up son on account of a political disagreement is

brutal and barbaric. I doubt if we ought to allow our daughter to remain under the roof of a man who is capable of such conduct."

The wife, who cherished a similar doubt, was not slow to second this sentiment, and the result was that Hilda and her child took up their abode at the parsonage. The Judge, strange to say, offered no strenuous opposition, although he knew that the large, empty house would be doubly desolate without Hilda and his grandchild. He had aged terribly within the last months. His combative temper seemed to have deserted him; he was a vain man, and with all his pride very dependent upon the admiration of his fellow-men. His loud self-assertion was not an indication of strength of character, but rather of an exaggerated conceit, nourished by the constant adulation of his family and dependents. The withdrawal of this homage cut the Judge to the quick, and his uneasy conscience, which brooded on the wrong he had done his son, saw in every evidence of disrespect the finger of Nemesis. That much of it was due to the democratic spirit which during the last years had invaded even the remote mountain valleys of Norway, he was incapable of comprehending. Yet, in most instances, he was undoubtedly right; the whole valley had become the champion of his absent son, and his avenger. When he stepped from his carriage at the gate of the church-yard, people turned their backs or walked away in order to avoid greeting him; the pastor no longer waited to commence his sermon until Mr. Gamborg was in his seat; his boatman, who rowed him to court in his large twelve-oared barge, answered curtly when he spoke to them, and plainly showed him their ill-will. It was no consolation to him to know that the story of his maltreatment of his son had been enormously exaggerated; his dignity forbade him to justify himself. He would have liked very well, too, to reinstate the tenants whom he had "evicted" after the election, had only his dignity permitted; not because he pitied their misery, but as an indirect expiation of the wrong done to his son. But it was that accursed dignity of his which stood in the way of all his good resolves.

In the meanwhile he suffered as he had never suffered before. Not only through his vanity and his thirst for praise did he receive many a wound, but these surface hurts roused the regions of his soul next within, and stirred the depths into tumult. His wife and his daughter, who had always seemed so near to him, and been his stanch partisans through right and wrong, had, somehow, drifted away from him; and the thought tormented him that they undoubtedly had read all Harold's

letters, and deceived him by their pretended ignorance. He would himself have given a year of his life to know what Harold was doing and how he fared, but how could he divest himself of that cherished dignity of his, and ask the questions which he had himself forbidden? After much meditation the Judge formed a plan which seemed both ingenious and feasible. He invited Hilda and her parents to dinner on Mrs. Gamborg's birthday, and during the evening he absented himself on the plea of pressing business (as he was often in the habit of doing), and hastened along the beach toward the parsonage. Chance favored his design; he entered unobserved by the front door, mounted the broad, dusky stairway to his daughter-in-law's room, and peered cautiously through the half-open door. There was a small spirit-lamp burning on the table; the child was sleeping peacefully in its cradle, and the nurse was absent. The Judge was out of breath, and he paused on the threshold to compose himself; his heart ran riot and the blood hammered in his temples. The floor creaked under the weight of his portly figure as he stooped down to kiss the sleeping child, and with a start he straightened himself and gazed uneasily about him. He stole on tiptoe up to the window where a little mahogany writing-table stood, and placing the lamp upon it, he unlocked one of the drawers and eagerly seized a package of letters tied with a pink ribbon. With a tremulous hand he untied the knot, and after having once more satisfied himself that he need have no fear of interruption, he began to read. It was the first letter, in which Harold told of his arrival in England and of a dangerous adventure he had had in Liverpool. The coolness and address with which he had acted excited the Judge's admiration; he read on breathlessly. He had himself never been out of Norway, and his son's description of the great world with its wonderful sights interested him profoundly. Then came the next letter, from New York, which dealt chiefly with the voyage and queer types of men from widely separated climes. The descriptions were very clever and full of vivid touches. The Judge smiled with pride and delight; he had never known that his son was such a talented man; he (the Judge) was himself scarcely capable of writing such a letter. Time slipped by, but the Judge took no note of it; he was now at the coal-heaving period, which was passed over lightly and humorously by the writer, but in which a loving ingenuity would read a pathos too sad for tears. The Judge was deeply moved; to such need had *his* son been reduced, and yet been too proud to appeal to

his father for aid. He had preferred to heave coal with hands unused to toil, rather than humiliate himself before a father who had wronged him. Such a feeling the Judge could understand; it appealed mightily to him. Vehemently aroused, he arose, heedless of the sleeping baby, and began to pace the floor excitedly.

"He is my son indeed," he cried, "my own son, my own, my own!"

The tears coursed down his cheeks, his broad chest heaved; then, eager to continue the narrative, he flung himself upon the chair at the writing-table and was soon deeply absorbed in the next letter. His features changed with every varying emotion; he had completely forgotten the situation. He did not hear the light creaking of the stairs without, nor did he see the shadow which paused in consternation on the threshold, then slowly stretched across the floor until it reached the white window-curtain, where it bent cautiously over his own. A hand was laid lightly upon the Judge's shoulder. He started up with a bewildered exclamation. But in an instant he recovered himself, and seizing Hilda by the arm drew her gently up to him.

"Child," he whispered, "will you help me?"

"Help you, father?" she asked, gazing into his face with joyous, tear-dimmed eyes.

"Bring my son back again," begged the old man brokenly, and turned away to master his emotion.

"Yes, father, I will bring him back to you," she answered.

"God bless you!" he exclaimed.

VI.

THE pastor, although he was not fond of America, and had often made warning allusions to the Union in his sermons, was nothing loth to accompany his daughter on her daring expedition. It availed him little that he spoke in his farewell sermon of the solemn call of duty, and alluded feelingly to the many dear ties which bound him to his home; his eagerness to get away and take a little jaunt in the world was so great that he caught himself twenty times a day forgetting his rôle of a martyr to duty. The Government, it appeared, valued so highly his political sermons, though they had been somewhat scarce of late, that it could ill afford to spare him, even for a limited time, but agreed with him that such herculean efforts of intellect must involve a terrible expenditure of cerebral tissue, and further concluded that so valiant a servant of the state had well earned his leisure.

The Judge in the meanwhile occupied his

leisure in divesting himself of his dignity. His first act after his daughter-in-law's departure was to summon his evicted tenants and announce to them that they were at liberty to resume their holdings and to entertain whatever political opinions they pleased.

"You know," he said pleasantly, "my son and I have not always agreed in political matters. If I could not persuade him, how much less can I expect to control my tenants? I am an old fellow, and perhaps don't see things as clearly as I thought I did. But I have a son who is abreast of the age. He will soon come home and take my place."

He made haste to write to Hilda what he had done, so as to clear away every obstacle to his son's return. He grew as light-hearted as a boy when the letter was sent, and talked freely with everybody about Harold's American experiences and his expected return. He felt a glow of paternal pride when he related how manfully "the boy" had struggled with adversity and only made light of it, and it gave him a thrill of pleasure to perceive with what respect his son was regarded in the valley, and how near he seemed to be to the hearts of all.

It was one morning early in October, I think, that the Judge was seen standing at the end of the pier spying anxiously into the distance through a field-glass. Six small cannon were placed along the beach, and Hans, the groom, stood with a fuse in his hand, watching for the Judge's signal. The flag was fluttering feebly from the top of the tall flag-pole; and the twelve-oared official barge, gayly decorated, lay gently bobbing upon the water.

It was early in the morning, and the sun had not yet appeared above the mountain-peaks, although there was a great yellow blaze in the eastern sky, and the highest peaks to the north had caught some stray shafts of light, and flashed with a dazzling radiance. There was yet a touch of frost in the air, and a light smoke hung over the fiord, and drifted lazily seaward. To the westward the fog seemed denser, and as there was scarcely any breeze, the Judge's field-glass was of no avail. Suddenly and silently the steamer's huge hull loomed out of the fog, and the Judge was so amazed that he came near forgetting the signal which was to give the rest of the family warning. Bang, bang, bang, went the cannon, and the steamer, which would not be behindhand in politeness, banged away in return; the twelve oarsmen in the barge cheered; the ladies came running down upon the pier breathless, and were scolded for their tardiness. Then out shot the barge through the light morning mist, and within a few minutes hove alongside the steamer. A stairway was lowered, and the Judge ran up the steps like a youth of twenty. A tall, handsome, bearded man grasped his hand at the head of the stairs and pressed it warmly. The Judge met his eyes and gazed into them for a moment silently. Both understood the meaning of that glance. Each asked the other's forgiveness and received it. Then, with an utterly irrational movement, the Judge turned abruptly away and embraced—the pastor. It was a grievous mistake; the embrace had been meant for Hilda. But perhaps the Judge was excusable. His eyes were dimmed with tears.

Hjalmar H. Boyesen.

THE INTERPRETER.

OH, well these places knew and loved us twain!
 The Genii softly laughed to see us pass,
 To kiss our blessed hands up climbed the grass,
 And on our pathway danced a flowery train;
 To counsel us each aged tree was fain,
 And all its leafy accents we could class;
 By symbol-circles on its polished glass,
 By chiming shallows, still the brook spake plain.
 Now all is changed: I look and list in vain;
 As one who sits and hears a solemn mass,
 In other language, in an alien fane,
 So I without thee in these haunts, alas!
 Am nature's stranger—so must I remain
 Till, sweet interpreter! thou come again.

Edith M. Thomas.

THE PRIVATE HISTORY OF A CAMPAIGN THAT FAILED.

BY MARK TWAIN.

YOU have heard from a great many people who did something in the war; is it not fair and right that you listen a little moment to one who started out to do something in it, but didn't? Thousands entered the war, got just a taste of it, and then stepped out again, permanently. These, by their very numbers, are respectable, and are therefore entitled to a sort of voice,—not a loud one, but a modest one; not a boastful one, but an apologetic one. They

ought not to be allowed much space among better people—people who did something—I grant that; but they ought at least to be allowed to state why they didn't do anything, and also to explain the process by which they didn't do anything. Surely this kind of light must have a sort of value.

Out West there was a good deal of confusion in men's minds during the first months of the great trouble—a good deal of unsettlement, of leaning first this way, then that, then the other way. It was hard for us to get our bearings. I call to mind an instance of this. I was piloting on the Mississippi when the news came that South Carolina had gone out of the Union on the 20th of December, 1860. My pilot-mate was a New Yorker. He was strong for the Union; so was I. But he would not listen to me with any patience; my loyalty was smirched, to his eye, because my father had owned slaves. I said, in palliation of this dark fact, that I had heard my father say, some years before he died, that slavery was a great wrong, and that he would free the solitary negro he then owned if he could think it right to give away the property of the family when he was so straitened in means. My mate retorted that a mere im-

pulse was nothing—anybody could pretend to a good impulse; and went on decrying my Unionism and libeling my ancestry. A month later the secession atmosphere had considerably thickened on the Lower Mississippi, and I became a rebel; so did he. We were together in New Orleans, the 26th of January, when Louisiana went out of the Union. He did his full share of the rebel shouting, but was bitterly opposed to letting me do mine. He said that I came of bad stock—of a father who had been willing to set slaves free. In the following summer he was piloting a Federal gun-boat and shouting for the Union again, and I was in the Confederate army. I held his note for some borrowed money. He was one of the most upright men I ever knew; but he repudiated that note without hesitation, because I was a rebel, and the son of a man who owned slaves.

In that summer—of 1861—the first wash of the wave of war broke upon the shores of Missouri. Our State was invaded by the Union forces. They took possession of St. Louis, Jefferson Barracks, and some other points. The

The Seat of War.

Governor, Claib Jackson, issued his proclamation calling out fifty thousand militia to repel the invader.

I was visiting in the small town where my

boyhood had been spent — Hannibal, Marion County. Several of us got together in a secret place by night and formed ourselves into a military company. One Tom Lyman, a young fellow of a good deal of spirit but of no military experience, was made captain; I was made second lieutenant. We had no first lieutenant; I do not know why; it was long ago. There were fifteen of us. By the advice of an innocent connected with the organization, we called ourselves the Marion Rangers. I do not remember that any one found fault with the name. I did not; I thought it sounded quite well. The young fellow who proposed this title was perhaps a fair sample of the kind of stuff we were made of. He was young, ignorant, good-natured, well-meaning, trivial, full of romance, and given to reading chivalric novels and singing forlorn love-ditties. He had some pathetic little nickel-plated aristocratic instincts, and detested his name, which was Dunlap; detested it, partly because it was nearly as common in that region as Smith, but mainly because it had a plebeian sound to his ear. So he tried to ennoble it by writing it in this way: *d'Unlap*. That contented his eye, but left his ear unsatisfied, for people gave the new name the same old pronunciation — emphasis on the front end of it. He then did the bravest thing that can be imagined, — a thing to make one shiver when one remembers how the world is given to resenting shams and affectations; he began to write his name so: *d'Un Lap*. And he waited patiently through the long storm of mud that was flung at this work of art, and he had his reward at last; for he lived to see that name accepted, and the emphasis put where he wanted it, by people who had known him all his life, and to whom the tribe of Dunlaps had been as familiar as the rain and the sunshine for forty years. So sure of victory at last is the courage that can wait. He said he had found, by consulting some ancient French chronicles, that the name was rightly and originally written *d'Un Lap*; and said that if it were translated into English it would mean Peterson: *Lap*, Latin or Greek, he said, for stone or rock, same as the French *pierre*, that is to say, Peter; *d'*, of or from; *un*, a or one; hence, *d'Un Lap*, of or from a stone or a Peter; that is to say, one who is the son of a stone, the son of a Peter — Peterson. Our militia company were not learned, and the explanation confused them; so they called him Peterson Dunlap. He proved useful to us in his way; he named our camps for us, and he generally struck a name that was “no slouch,” as the boys said.

That is one sample of us. Another was Ed Stevens, son of the town jeweler, — trim-built, handsome, graceful, neat as a cat;

PETERSON D'UN LAP.

bright, educated, but given over entirely to fun. There was nothing serious in life to him. As far as he was concerned, this military expedition of ours was simply a holiday. I should say that about half of us looked upon it in the same way; not consciously, perhaps, but unconsciously. We did not think; we were not capable of it. As for myself, I was full of unreasoning joy to be done with turning out of bed at midnight and four in the morning, for a while; grateful to have a change, new scenes, new occupations, a new interest. In my thoughts that was as far as I went; I did not go into the details; as a rule one doesn't at twenty-four.

Another sample was Smith, the blacksmith's apprentice. This vast donkey had some pluck, of a slow and sluggish nature, but a soft heart; at one time he would knock a horse down for some impropriety, and at another he would get homesick and cry. However, he had one ultimate credit to his account which some of us hadn't: he stuck to the war, and was killed in battle at last.

Jo Bowers, another sample, was a huge, good-natured, flax-headed lubber; lazy, senti-

mental, full of harmless brag, a grumbler by nature; an experienced, industrious, ambitious, and often quite picturesque liar, and yet not a successful one, for he had had no intelligent training, but was allowed to come up just any way. This life was serious enough to him, and seldom satisfactory. But he was a good fellow anyway, and the boys all liked him. He was made orderly sergeant; Stevens was made corporal.

These samples will answer — and they are quite fair ones. Well, this herd of cattle started for the war. What could you expect of them? They did as well as they knew how, but really what was justly to be expected of them? Nothing, I should say. That is what they did.

We waited for a dark night, for caution and secrecy were necessary; then, toward midnight, we stole in couples and from various directions to the Griffith place, beyond the town; from that point we set out together on foot. Hannibal lies at the extreme south-eastern corner of Marion County, on the Mississippi River; our objective point was the hamlet of New London, ten miles away, in Ralls County.

The first hour was all fun, all idle nonsense and laughter. But that could not be kept up. The steady trudging came to be like work; the play had somehow oozed out of it; the stillness of the woods and the somberness of the night began to throw a depressing influence over the spirits of the boys, and presently the talking died out and each person shut himself up in his own thoughts. During the last half of the second hour nobody said a word.

Now we approached a log farm-house where, according to report, there was a guard of five Union soldiers. Lyman called a halt; and there, in the deep gloom of the overhanging branches, he began to whisper a plan of assault upon that house, which made the gloom more depressing than it was before. It was a crucial moment; we realized, with a cold suddenness, that here was no jest — we were standing face to face with actual war. We were equal to the occasion. In our response there was no hesitation, no indecision: we said that if Lyman wanted to meddle with those soldiers, he could go ahead and do it; but if he waited for us to follow him, he would wait a long time.

Lyman urged, pleaded, tried to shame us, but it had no effect. Our course was plain, our minds were made up: we would flank the farm-house — go out around. And that is what we did.

We struck into the woods and entered upon a rough time, stumbling over roots, getting tangled in vines, and torn by briars. At last we reached an open place in a safe region,

and sat down, blown and hot, to cool off and nurse our scratches and bruises. Lyman was annoyed, but the rest of us were cheerful; we had flanked the farm-house, we had made our first military movement, and it was a success; we had nothing to fret about, we were feeling just the other way. Horse-play and laughing began again; the expedition was become a holiday frolic once more.

Then we had two more hours of dull trudging and ultimate silence and depression; then, about dawn, we straggled into New London, soiled, heel-blistered, fagged with our little march, and all of us except Stevens in a sour and raspy humor and privately down on the war. We stacked our shabby old shot-guns in Colonel Ralls's barn, and then went in a body and breakfasted with that veteran of the Mexican war. Afterwards he took us to a distant meadow, and there in the shade of a tree we listened to an old-fashioned speech from him, full of gunpowder and glory, full of that adjective-piling, mixed metaphor, and windy declamation which was regarded as eloquence in that ancient time and that remote region; and then he swore us on the Bible to be faithful to the State of Missouri and drive all invaders from her soil, no matter whence they might come or under what flag they might march. This mixed us considerably, and we could not make out just what service we were embarked in; but Colonel Ralls, the practiced politician and phrase-juggler, was not similarly in doubt; he knew quite clearly that he had invested us in the cause of the Southern Confederacy. He closed the solemnities by belting around me the sword which his neighbor, Colonel Brown, had worn at Buena Vista and Molino del Rey; and he accompanied this act with another impressive blast.

Then we formed in line of battle and marched four miles to a shady and pleasant piece of woods on the border of the far-reaching expanses of a flowery prairie. It was an enchanting region for war — our kind of war.

We pierced the forest about half a mile, and took up a strong position, with some low, rocky, and wooded hills behind us, and a purling, limpid creek in front. Straightway half the command were in swimming, and the other half fishing. The ass with the French name gave this position a romantic title, but it was too long, so the boys shortened and simplified it to Camp Ralls.

We occupied an old maple-sugar camp, whose half-rotted troughs were still propped against the trees. A long corn-crib served for sleeping quarters for the battalion. On our left, half a mile away, was Mason's farm and house; and he was a friend to the cause.

THE SWORD OF BUENA VISTA AND MOLINO DEL REY.

Shortly after noon the farmers began to arrive from several directions, with mules and horses for our use, and these they lent us for as long as the war might last, which they judged would be about three months. The animals were of all sizes, all colors, and all breeds. They were mainly young and frisky, and nobody in the command could stay on them long at a time; for we were town boys, and ignorant of horsemanship. The creature that fell to my share was a very small mule, and yet so quick and active that it could throw me without difficulty; and it did this whenever I got on it. Then it would bray—stretching its neck out, laying its ears back, and spreading its jaws till you could see down to its works. It was a disagreeable animal, in every way. If I took it by the bridle and tried to

lead it off the grounds, it would sit down and brace back, and no one could budge it. However, I was not entirely destitute of military resources, and I did presently manage to spoil this game; for I had seen many a steamboat aground in my time, and knew a trick or two which even a grounded mule would be obliged to respect. There was a well by the corn-crib; so I substituted thirty fathom of rope for the bridle, and fetched him home with the windlass.

I will anticipate here sufficiently to say that we did learn to ride, after some days' practice, but never well. We could not learn to like our animals; they were not choice ones, and most of them had annoying peculiarities of one kind or another. Stevens's horse would carry him, when he was not noticing, under

the huge excrescences which form on the trunks of oak-trees, and wipe him out of the saddle; in this way Stevens got several bad hurts. Sergeant Bowers's horse was very large and tall, with slim, long legs, and looked like a railroad bridge. His size enabled him to reach all about, and as far as he wanted to, with his head; so he was always biting Bowers's legs. On the march, in the sun, Bowers slept a good deal; and as soon as the horse recognized that he was asleep he would reach around and bite him on the leg. His legs were black and blue with bites. This was the only thing that could ever make him swear, but this always did; whenever the horse bit him he always swore, and of course Stevens, who laughed at everything, laughed at this, and would even get into such convulsions over it as to lose his balance and fall off his horse; and then Bowers, already irritated by the pain of the horse-bite, would resent the laughter with hard language, and there would be a quarrel; so that horse made no end of trouble and bad blood in the command.

However, I will get back to where I was — our first afternoon in the sugar-camp. The sugar-troughs came very handy as horse-troughs, and we had plenty of corn to fill them with. I ordered Sergeant Bowers to

feed my mule; but he said that if I reckoned he went to war to be dry-nurse to a mule, it wouldn't take me very long to find out my mistake. I believed that this was insubordination, but I was full of uncertainties about everything military, and so I let the thing pass, and went and ordered Smith, the blacksmith's apprentice, to feed the mule; but he merely gave me a large, cold, sarcastic grin, such as an ostensibly seven-year-old horse gives you when you lift his lip and find he is fourteen, and turned his back on me. I then went to the captain, and asked if it was not right and proper and military for me to have an orderly. He said it was, but as there was only one orderly in the corps, it was but right that he himself should have Bowers on his staff. Bowers said he wouldn't serve on anybody's staff; and if anybody thought he could make him, let him try it. So, of course, the thing had to be dropped; there was no other way.

Next, nobody would cook; it was considered a degradation; so we had no dinner. We lazed the rest of the pleasant afternoon away, some dozing under the trees, some smoking cob-pipes and talking sweethearts and war, some playing games. By late supper-time all hands were famished; and to meet the difficulty all hands turned to, on an equal

"IT WAS A DISAGREEABLE ANIMAL IN EVERY WAY."

footing, and gathered wood, built fires, and cooked the meal. Afterward everything was smooth for a while; then trouble broke out between the corporal and the sergeant, each claiming to rank the other. Nobody knew which was the higher office; so Lyman had to settle the matter by making the rank of both officers equal. The commander of an ignorant crew like that has many troubles and vexations which probably do not occur in the regular army at all. However, with the song-singing and yarn-spinning around the camp-fire, everything presently became serene again; and by and by we raked the corn down level in one end of the crib, and all went to bed on it, tying a horse to the door, so that he would neigh if any one tried to get in.*

We had some horsemanship drill every forenoon; then, afternoons, we rode off here and there in squads a few miles, and visited the farmers' girls, and had a youthful good time, and got an honest good dinner or supper, and then home again to camp, happy and content.

For a time, life was idly delicious, it was

SERGEANT BOWERS RECEIVING ORDERS.

perfect; there was nothing to mar it. Then came some farmers with an alarm one day. They said it was rumored that the enemy were advancing in our direction, from over Hyde's prairie. The result was a sharp stir among us, and general consternation. It was a rude awakening from our pleasant trance. The rumor was but a rumor—nothing definite about it; so, in the confusion, we did not know which way to retreat. Lyman was for not retreating at all, in these uncertain circumstances; but he found that if he tried to maintain that attitude he would fare badly, for the command were in no humor to put up with insubordination. So he yielded the

* It was always my impression that that was what the horse was there for, and I know that it was also the impression of at least one other of the command, for we talked about it at the time, and admired the military ingenuity of the device; but when I was out West three years ago I was told by Mr. A. G. Fuqua, a member of our company, that the horse was his, that the leaving him tied at the door was a matter of mere forgetfulness, and that to attribute it to intelligent invention was to give him quite too much credit. In support of his position, he called my attention to the suggestive fact that the artifice was not employed again. I had not thought of that before.

THE VENERABLE BLACKSMITH WITH HIS WEAPON.
(SEE PAGE 203.)

point and called a council of war—to consist of himself and the three other officers; but the privates made such a fuss about being left out, that we had to allow them to be present. I mean we had to allow them to remain, for they were already present, and doing the most of the talking too. The question was, which way to retreat; but all were so flurried that nobody seemed to have even a guess to offer. Except Lyman. He explained in a few calm words, that inasmuch as the enemy were approaching from over Hyde's prairie, our course was simple: all we had to do was not to retreat *toward* him; any other direction would answer our needs perfectly. Everybody saw in a moment how true this was, and how wise; so Lyman got a great many compliments. It was now decided that we should fall back on Mason's farm.

It was after dark by this time, and as we could not know how soon the enemy might arrive, it did not seem best to try to take the horses and things with us; so we only took the guns and ammunition, and started at once. The route was very rough and hilly and rocky, and presently the night grew very black and rain began to fall; so we had a troublesome time of it, struggling and stumbling along in the dark; and soon some person slipped and fell, and then the next person behind stumbled over him and fell, and so did the rest, one after the other; and then Bowers came with the keg of powder in his arms, whilst the command were all mixed together, arms and legs, on the muddy slope; and so he fell, of course, with the keg, and this started the whole detachment down the hill in a body, and they landed in the brook at the bottom in a pile, and each that was undermost pulling the hair and scratching and biting those that were on top of him; and those that were being scratched and bitten scratching and biting the rest in their turn, and all saying they would die before they would ever go to war again if they ever got out of this brook this time, and the invader might rot for all they cared, and the country along with him—and all such talk as that, which was dismal to hear and take part in, in such smothered, low voices, and such a grisly dark place and so wet, and the enemy may be coming any moment.

The keg of powder was lost, and the guns too; so the growling and complaining continued straight along whilst the brigade pawed around the pasty hillside and slopped around in the brook hunting for these things; consequently we lost considerable time at this; and then we heard a sound, and held our breath and listened, and it seemed to be the enemy coming, though it could have been a cow, for

it had a cough like a cow; but we did not wait, but left a couple of guns behind and struck out for Mason's again as briskly as we could scramble along in the dark. But we got lost presently among the rugged little ravines, and wasted a deal of time finding the way again, so it was after nine when we reached Mason's stile at last; and then before we could open our mouths to give the countersign, several dogs came bounding over the fence, with great riot and noise, and each of them took a soldier by the slack of his trousers and be-

gan to back away with him. We could not shoot the dogs without endangering the persons they were attached to; so we had to look on, helpless, at what was perhaps the most mortifying spectacle of the civil war. There was light enough, and to spare, for the Masons had now run out on the porch with candles in their hands. The old man and his son came and undid the dogs without difficulty, all but Bowers's; but they couldn't undo his dog, they didn't know his combination; he was of the bull kind, and seemed to be set with a Yale time-lock; but they got him loose at last with some scalding water, of which Bowers got his share and returned thanks. Peterson Dunlap afterwards made up a fine name for this engagement, and also for the night march which preceded it, but both have long ago faded out of my memory.

We now went into the house, and they began to ask us a world of questions, whereby it presently came out that we did not know anything concerning who or what we were

running from; so the old gentleman made himself very frank, and said we were a curious breed of soldiers, and guessed we could be depended on to end up the war in time, because no government could stand the expense

Then we got a little sleep. But after all we had gone through, our activities were not over for the night; for about two o'clock in the morning we heard a shout of warning from down the lane, accompanied by a chorus from

FARMER MASON EXPLAINING THE PRINCIPLES OF WAR.

of the shoe-leather we should cost it trying to follow us around. "Marion *Rangers*! good name, b'gosh!" said he. And wanted to know why we hadn't had a picket-guard at the place where the road entered the prairie, and why we hadn't sent out a scouting party to spy out the enemy and bring us an account of his strength, and so on, before jumping up and stampeding out of a strong position upon a mere vague rumor — and so on and so forth, till he made us all feel shabbier than the dogs had done, not half so enthusiastically welcome. So we went to bed shamed and low-spirited; except Stevens. Soon Stevens began to devise a garment for Bowers which could be made to automatically display his battle-scars to the grateful, or conceal them from the envious, according to his occasions; but Bowers was in no humor for this, so there was a fight, and when it was over Stevens had some battle-scars of his own to think about.

all the dogs, and in a moment everybody was up and flying around to find out what the alarm was about. The alarmist was a horseman who gave notice that a detachment of Union soldiers was on its way from Hannibal with orders to capture and hang any bands like ours which it could find, and said we had no time to lose. Farmer Mason was in a flurry this time, himself. He hurried us out of the house with all haste, and sent one of his negroes with us to show us where to hide ourselves and our tell-tale guns among the ravines half a mile away. It was raining heavily.

We struck down the lane, then across some rocky pasture-land which offered good advantages for stumbling; consequently we were down in the mud most of the time, and every time a man went down he blackguarded the war, and the people that started it, and everybody connected with it, and gave himself the master dose of all for being so foolish as to go into it. At last we reached the wooded mouth

of a ravine, and there we huddled ourselves under the streaming trees, and sent the negro back home. It was a dismal and heart-breaking time. We were like to be drowned with the rain, deafened with the howling wind and the booming thunder, and blinded by the lightning. It was indeed a wild night. The drenching we were getting was misery enough, but a deeper misery still was the reflection that the halter might end us before we were a day older. A death of this shameful sort had not occurred to us as being among the possibilities of war. It took the romance all out of the campaign, and turned our dreams of glory into a repulsive nightmare. As for doubting that so barbarous an order had been given, not one of us did that.

The long night wore itself out at last, and then the negro came to us with the news that the alarm had manifestly been a false one, and that breakfast would soon be ready. Straightway we were lighted-hearted again, and the world was bright, and life as full of hope and promise as ever—for we were young then. How long ago that was! Twenty-four years.

The mongrel child of philology named the night's refuge Camp Devastation, and no soul objected. The Masons gave us a Missouri country breakfast, in Missourian abundance, and we needed it: hot biscuits; hot "wheat bread" prettily criss-crossed in a lattice pattern on top; hot corn pone; fried chicken; bacon, coffee, eggs, milk, buttermilk, etc.;—and the world may be confidently challenged to furnish the equal to such a breakfast, as it is cooked in the South.

We staid several days at Mason's; and after all these years the memory of the dullness, the stillness and lifelessness of that slumberous farm-house still oppresses my spirit as with a sense of the presence of death and mourning. There was nothing to do, nothing to think about; there was no interest in life. The male part of the household were away in the fields all day, the women were busy and out of our sight; there was no sound but the plaintive wailing of a spinning-wheel, forever moaning out from some distant room,—the most lonesome sound in nature, a sound steeped and sodden with homesickness and the emptiness of life. The family went to bed about dark every night, and as we were not invited to intrude any new customs, we naturally followed theirs. Those nights were a hundred years long to youths accustomed to being up till twelve. We lay awake and miserable till that hour every time, and grew old and decrepit waiting through the still eternities for the clock-strikes. This was no place for town boys. So at last it was with something very like joy that we received news that the enemy

were on our track again. With a new birth of the old warrior spirit, we sprang to our places in line of battle and fell back on Camp Ralls.

Captain Lyman had taken a hint from Mason's talk, and he now gave orders that our camp should be guarded against surprise by the posting of pickets. I was ordered to place a picket at the forks of the road in Hyde's prairie. Night shut down black and threatening. I told Sergeant Bowers to go out to that place and stay till midnight; and, just as I was expecting, he said he wouldn't do it. I tried to get others to go, but all refused. Some excused themselves on account of the weather; but the rest were frank enough to say they wouldn't go in any kind of weather. This kind of thing sounds odd now, and impossible, but there was no surprise in it at the time. On the contrary, it seemed a perfectly natural thing to do. There were scores of little camps scattered over Missouri where the same thing was happening. These camps were composed of young men who had been born and reared to a sturdy independence, and who did not know what it meant to be ordered around by Tom, Dick, and Harry, whom they had known familiarly all their lives, in the village or on the farm. It is quite within the probabilities that this same thing was happening all over the South. James Redpath recognized the justice of this assumption, and furnished the following instance in support of it. During a short stay in East Tennessee he was in a citizen colonel's tent one day, talking, when a big private appeared at the door, and without salute or other circumlocution said to the colonel:

"Say, Jim, I'm a-goin' home for a few days."

"What for?"

"Well, I hain't b'en there for a right smart while, and I'd like to see how things is comin' on."

"How long are you going to be gone?"

"'Bout two weeks."

"Well, don't be gone longer than that; and get back sooner if you can."

That was all, and the citizen officer resumed his conversation where the private had broken it off. This was in the first months of the war, of course. The camps in our part of Missouri were under Brigadier-General Thomas H. Harris. He was a townsman of ours, a first-rate fellow, and well liked; but we had all familiarly known him as the sole and modest-salaried operator in our telegraph office, where he had to send about one dispatch a week in ordinary times, and two when there was a rush of business; consequently, when he appeared in our midst one day, on the wing, and delivered a military command of

some sort, in a large military fashion, nobody was surprised at the response which he got from the assembled soldiery :

"Oh, now, what'll you take to *don't*, Tom Harris!"

It was quite the natural thing. One might justly imagine that we were hopeless material for war. And so we seemed, in our ignorant state; but there were those among us who afterward learned the grim trade; learned to obey like machines; became valuable soldiers; fought all through the war, and came out at the end with excellent records. One of the very boys who refused to go out on picket duty that night, and called me an ass for thinking he would expose himself to danger in such a foolhardy way, had become distinguished for intrepidity before he was a year older.

I did secure my picket that night—not by authority, but by diplomacy. I got Bowers to go, by agreeing to exchange ranks with him for the time being, and go along and stand the watch with him as his subordinate. We staid out there a couple of dreary hours in the pitchy darkness and the rain, with nothing to modify the dreariness but Bowers's monotonous growlings at the war and the weather; then we began to nod, and presently found it next to impossible to stay in the saddle; so we gave up the tedious job, and went back to the camp without waiting for the relief guard. We rode into camp without interruption or objection from anybody, and the enemy could have done the same, for there were no sentries. Everybody was asleep; at midnight there was nobody to send out another picket, so none was sent. We never tried to establish a watch at night again, as far as I remember, but we generally kept a picket out in the daytime.

In that camp the whole command slept on the corn in the big corn-crib; and there was usually a general row before morning, for the place was full of rats, and they would scramble over the boys' bodies and faces, annoying and irritating everybody; and now and then they would bite some one's toe, and the person who owned the toe would start up and magnify his English and begin to throw corn in the dark. The ears were half as heavy as bricks, and when they struck they hurt. The persons struck would respond, and inside of five minutes every man would be locked in a death-grip with his neighbor. There was a grievous deal of blood shed in the corn-crib, but this was all that was spilt while I was in the war. No, that is not quite true. But for one circumstance it would have been all. I will come to that now.

Our scares were frequent. Every few days

rumors would come that the enemy were approaching. In these cases we always fell back on some other camp of ours; we never staid where we were. But the rumors always turned out to be false; so at last even we began to grow indifferent to them. One night a negro was sent to our corn-crib with the same old warning: the enemy was hovering in our neighborhood. We all said let him hover. We resolved to stay still and be comfortable. It was a fine warlike resolution, and no doubt we all felt the stir of it in our veins—for a moment. We had been having a very jolly time, that was full of horse-play and school-boy hilarity; but that cooled down now, and presently the fast-waning fire of forced jokes and forced laughs died out altogether, and the company became silent. Silent and nervous. And soon uneasy—worried—apprehensive. We had said we would stay, and we were committed. We could have been persuaded to go, but there was nobody brave enough to suggest it. An almost noiseless movement presently began in the dark, by a general but unvoiced impulse. When the movement was completed, each man knew that he was not the only person who had crept to the front wall and had his eye at a crack between the logs. No, we were all there; all there with our hearts in our throats, and staring out toward the sugar-troughs where the forest foot-path came through. It was late, and there was a deep woodsy stillness everywhere. There was a veiled moonlight, which was only just strong enough to enable us to mark the general shape of objects. Presently a muffled sound caught our ears, and we recognized it as the hoof-beats of a horse or horses. And right away a figure appeared in the forest path; it could have been made of smoke, its mass had so little sharpness of outline. It was a man on horse-back; and it seemed to me that there were others behind him. I got hold of a gun in the dark, and pushed it through a crack between the logs, hardly knowing what I was doing, I was so dazed with fright. Somebody said "Fire!" I pulled the trigger. I seemed to see a hundred flashes and hear a hundred reports, then I saw the man fall down out of the saddle. My first feeling was of surprised gratification; my first impulse was an apprentice-sportsman's impulse to run and pick up his game. Somebody said, hardly audibly, "Good—we've got him!—wait for the rest." But the rest did not come. We waited—listened—still no more came. There was not a sound, not the whisper of a leaf; just perfect stillness; an uncanny kind of stillness, which was all the more uncanny on account of the damp, earthy, late-night smells now ris-

ing and pervading it. Then, wondering, we crept stealthily out, and approached the man. When we got to him the moon revealed him distinctly. He was lying on his back, with his arms abroad; his mouth was open and his chest heaving with long gasps, and his white shirt-front was all splashed with blood. The thought shot through me that I was a murderer; that I had killed a man—a man who had never done me any harm. That was the coldest sensation that ever went through my marrow. I was down by him in a moment, helplessly stroking his forehead; and I would have given anything then—my own life freely—to make him again what he had been five minutes before. And all the boys seemed to be feeling in the same way; they hung over him, full of pitying interest, and tried all they could to help him, and said all sorts of regretful things. They had forgotten all about the enemy; they thought only of this one forlorn unit of the foe. Once my imagination persuaded me that the dying man gave me a reproachful look out of his shadowy eyes, and it seemed to me that I could rather he had stabbed me than done that. He muttered and mumbled like a dreamer in his sleep, about his wife and his child; and I thought with a new despair, "This thing that I have done does not end with him; it falls upon *them* too, and they never did me any harm, any more than he."

In a little while the man was dead. He was killed in war; killed in fair and legitimate war; killed in battle, as you may say; and yet he was as sincerely mourned by the opposing force as if he had been their brother. The boys stood there a half hour sorrowing over him, and recalling the details of the tragedy, and wondering who he might be, and if he were a spy, and saying that if it were to do over again they would not hurt him unless he attacked them first. It soon came out that mine was not the only shot fired; there were five others,—a division of the guilt which was a grateful relief to me, since it in some degree lightened and diminished the burden I was carrying. There were six shots fired at once; but I was not in my right mind at the time, and my heated imagination had magnified my one shot into a volley.

The man was not in uniform, and was not armed. He was a stranger in the country; that was all we ever found out about him. The thought of him got to preying upon me every night; I could not get rid of it. I could not drive it away, the taking of that unoffending life seemed such a wanton thing. And it seemed an epitome of war; that all war must be just that—the killing of strangers against

whom you feel no personal animosity; strangers whom, in other circumstances, you would help if you found them in trouble, and who would help you if you needed it. My campaign was spoiled. It seemed to me that I was not rightly equipped for this awful business; that war was intended for men, and I for a child's nurse. I resolved to retire from this avocation of sham soldiery while I could save some remnant of my self-respect. These morbid thoughts clung to me against reason; for at bottom I did not believe I had touched that man. The law of probabilities decreed me guiltless of his blood; for in all my small experience with guns I had never hit anything I had tried to hit, and I knew I had done my best to hit him. Yet there was no solace in the thought. Against a diseased imagination, demonstration goes for nothing.

The rest of my war experience was of a piece with what I have already told of it. We kept monotonously falling back upon one camp or another, and eating up the country. I marvel now at the patience of the farmers and their families. They ought to have shot us; on the contrary, they were as hospitably kind and courteous to us as if we had deserved it. In one of these camps we found Ab Grimes, an Upper Mississippi pilot, who afterwards became famous as a dare-devil rebel spy, whose career bristled with desperate adventures. The look and style of his comrades suggested that they had not come into the war to play, and their deeds made good the conjecture later. They were fine horsemen and good revolver-shots; but their favorite arm was the lasso. Each had one at his pommel, and could snatch a man out of the saddle with it every time, on a full gallop, at any reasonable distance.

In another camp the chief was a fierce and profane old blacksmith of sixty, and he had furnished his twenty recruits with gigantic home-made bowie-knives, to be swung with the two hands, like the *machetes* of the Isthmus. It was a grisly spectacle to see that earnest band practicing their murderous cuts and slashes under the eye of that remorseless old fanatic.

The last camp which we fell back upon was in a hollow near the village of Florida, where I was born—in Monroe County. Here we were warned, one day, that a Union colonel was sweeping down on us with a whole regiment at his heels. This looked decidedly serious. Our boys went apart and consulted; then we went back and told the other companies present that the war was a disappointment to us and we were going to disband. They were getting ready, themselves, to fall back on some place or other, and were only

waiting for General Tom Harris, who was expected to arrive at any moment; so they tried to persuade us to wait a little while, but the majority of us said no, we were accustomed to falling back, and didn't need any of Tom Harris's help; we could get along perfectly well without him — and save time too. So about half of our fifteen, including myself, mounted and left on the instant; the others yielded to persuasion and staid — staid through the war.

An hour later we met General Harris on the road, with two or three people in his company — his staff, probably, but we could not tell; none of them were in uniform; uniforms had not come into vogue among us yet. Harris ordered us back; but we told him there was a Union colonel coming with a whole regiment in his wake, and it looked as if there was going to be a disturbance; so we had concluded to go home. He raged a little, but it was of no use; our minds were made up. We had done our share; had killed one man, exterminated one army, such as it was; let him go and kill the rest, and that would end the war. I did not see that brisk young general again until last year; then he was wearing white hair and whiskers.

In time I came to know that Union colonel whose coming frightened me out of the war and crippled the Southern cause to that extent — General Grant. I came within a few hours of seeing him when he was as unknown as I

was myself; at a time when anybody could have said, "Grant? — Ulysses S. Grant? I do not remember hearing the name before." It seems difficult to realize that there was once a time when such a remark could be rationally made; but there *was*, and I was within a few miles of the place and the occasion too, though proceeding in the other direction.

The thoughtful will not throw this war-paper of mine lightly aside as being valueless. It has this value: it is a not unfair picture of what went on in many and many a militia camp in the first months of the rebellion, when the green recruits were without discipline, without the steadying and heartening influence of trained leaders; when all their circumstances were new and strange, and charged with exaggerated terrors, and before the invaluable experience of actual collision in the field had turned them from rabbits into soldiers. If this side of the picture of that early day has not before been put into history, then history has been to that degree incomplete, for it had and has its rightful place there. There was more Bull Run material scattered through the early camps of this country than exhibited itself at Bull Run. And yet it learned its trade presently, and helped to fight the great battles later. I could have become a soldier myself, if I had waited. I had got part of it learned; I knew more about retreating than the man that invented retreating.

Mark Twain.

EVE.

ONE in the sunrise of primeval day,
 More lovely than the virgin world around,
 With fingers pressed on lips that made no sound,
 She stood and gazed. Spread out before her lay
 The future — and the clouds were rolled away.
 The war of kings in empires still unbound,
 The crash of cannon that should yet resound,
 She heard, and saw the great world rock and sway.
 Across the crimson sky above her head
 There came a cry of children asking food;
 A wail of women for the nations' dead
 Went upward to the stars. So pale she stood;
 Then to some secret place in Eden fled,
 And wept in presage of her motherhood.

W. J. Henderson.

THE BOSTONIANS.*

BY HENRY JAMES,

Author of "Portrait of a Lady," "Daisy Miller," "Lady Barberina," etc.

XXXVI.—(Continued.)

"YOU always want me to come out! We can't go out here; we *are* out, as much as we can be!" Verena laughed. She tried to turn it off—feeling that something really impended.

"Come down into the garden, and out beyond there—to the water, where we can speak. It's what I have come for; it was not for what I told Miss Olive!"

He had lowered his voice, as if Miss Olive might still hear them, and there was something strangely grave—altogether solemn, indeed—in its tone. Verena looked around her, at the splendid summer day, at the much-swathed, formless figure of Miss Birdseye, holding her letter inside her hat. "Mr. Ransom!" she articulated then, simply; and as her eyes met his again, they showed him in each a tear.

"It's not to make you suffer, I honestly believe. I don't want to say anything that will hurt you. How can I possibly hurt you, when I feel to you as I do?" he went on, with suppressed force.

She said no more, but all her face entreated him to let her off, to spare her; and as this look deepened, a quick sense of elation and success began to throb in his heart, for it told him exactly what he wanted to know. It told him that she was afraid of him, that she had ceased to trust herself, that the way he had read her nature was the right way (she was tremendously open to attack, she was meant for love, she was meant for him), and that his arriving at the point at which he wished to arrive was only a question of time. This happy consciousness made him extraordinarily tender to her; he couldn't put enough reassurance into his smile, his low murmur, as he said: "Only give me ten minutes; don't receive me by turning me away. It's my holiday—my poor little holiday; don't spoil it."

Three minutes later Miss Birdseye, looking up from her letter, saw them move together through the bristling garden and traverse a gap in the old fence which inclosed the farther side of it. They passed into the ancient hip-yard which lay beyond, and which was now a mere vague, grass-grown approach to

the waterside, bestrewn with a few remnants of supererogatory timber. She saw them stroll forward to the edge of the bay and stand there, taking the soft breeze in their faces. She watched them a little, and it warmed her heart to see the stiff-necked young Southerner led captive by a daughter of New England trained in the right school, who would impose her opinions in their integrity. Considering how prejudiced he must have been, he was certainly behaving very well; even at that distance Miss Birdseye dimly made out that there was something positively humble in the way he invited Verena Tarrant to seat herself on a low pile of weather-blackened planks which constituted the principal furniture of the place, and something, perhaps, just a trifle too expressive of righteous triumph in the manner in which the girl put the suggestion by and stood where she liked, a little proudly, turning a good deal away from him. Miss Birdseye could see as much as this, but she couldn't hear, so that she didn't know what it was that made Verena turn suddenly back to him, at something he said. If she had known, perhaps his observation would have struck her as less singular—under the circumstances in which these two young persons met—than it may appear to the reader.

"They have accepted one of my articles; I think it's the best." These were the first words that passed Basil Ransom's lips after the pair had withdrawn as far as it was possible to withdraw (in that direction) from the house.

"Oh, is it printed—when does it appear?" Verena asked that question instantly; it sprang from her lips in a manner that completely belied the air of keeping herself at a distance from him, which she had worn a few moments before.

He didn't tell her again this time, as he had told her when, on the occasion of their walk together in New York, she expressed an inconsequent hope that his fortune as a rejected contributor would take a turn—he didn't remark to her once more that she was a delightful being; he only went on (as if her revulsion were a matter of course) to explain everything he could, so that she might as soon as possible know him better and see how

completely she could trust him. "That was, at bottom, the reason I came here. The essay in question is the most important thing I have done in the way of a literary attempt, and I determined to give up the game or to persist, according as I should be able to bring it to the light or not. The other day I got a letter from the editor of the 'Rational Review,' telling me that he should be very happy to print it, that he thought it very remarkable, and that he should be glad to hear from me again. He shall hear from me again—he needn't be afraid! It contained a good many of the opinions I have expressed to you, and a good many more besides. I really believe it will attract some attention. At any rate, the simple fact that it is to be published makes an era in my life. This will seem pitiful to you, no doubt, who publish yourself, have been before the world these several years, and are flushed with every kind of triumph; but to me it's simply a tremendous affair. It makes me believe I may do something; it has changed the whole way I look at my future. I have been building castles in the air, and I have put you in the biggest and fairest of them. That's a great change, and, as I say, it's really why I came on."

Verena lost not a word of this gentle, conciliatory, explicit statement; it was full of surprises for her, and as soon as Ransom had stopped speaking she inquired: "Why, didn't you feel satisfied about your future before?"

Her tone made him feel how little she had suspected he could have the weakness of a discouragement, how little of a question it must have seemed to her that he would one day triumph on his own erratic line. It was the sweetest tribute he had yet received to the idea that he might have ability; the letter of the editor of the "Rational Review" was nothing to it. "No, I felt very blue; it didn't seem to me at all clear that there was a place for me in the world."

• "Gracious!" said Verena Tarrant.

A quarter of an hour later Miss Birdseye, who had returned to her letters (she had a correspondent at Framingham who usually wrote fifteen pages), became aware that Verena, who was now alone, was reëntering the house. She stopped her on her way, and said she hoped she hadn't pushed Mr. Ransom overboard.

"Oh, no; he has gone off—round the other way."

"Well, I hope he is going to speak for us soon."

Verena hesitated a moment. "He speaks with the pen. He has written a very fine article—for the 'Rational Review.'"

Miss Birdseye gazed at her young friend

complacently; the sheets of her interminable letter fluttered in the breeze. "Well, it's delightful to see the way it goes on, isn't it?"

Verena scarcely knew what to say; then, remembering that Doctor Prance had told her that they might lose their dear old companion any day, and confronting it with something Basil Ransom had just said,—that the "Rational Review" was a quarterly, and the editor had notified him that his article would appear only in the number after the next,—she reflected that perhaps Miss Birdseye wouldn't be there, so many months later, to see how it was her supposed consort had spoken. She might, therefore, be left to believe what she liked to believe, without fear of a day of reckoning. Verena committed herself to nothing more confirmatory than a kiss, however, which the old lady's displaced head-gear enabled her to imprint upon her forehead, and which caused Miss Birdseye to exclaim, "Why, Verena Tarrant, how cold your lips are!" It was not surprising to Verena to hear that her lips were cold; a mortal chill had crept over her, for she knew that, this time, she should have a tremendous scene with Olive.

She found her in her room, to which she had fled on quitting Mr. Ransom's presence; she sat in the window, having evidently sunk into a chair the moment she came in, a position from which she must have seen Verena walk through the garden and down to the water with the intruder. She remained as she had collapsed, quite prostrate; her position was the same as that other time Verena had found her waiting, in New York. What Olive was likely to say to her first, the girl scarcely knew; her mind, at any rate, was full of an intention of her own. She went straight to her, and fell on her knees before her, taking hold of the hands which were clasped together, with nervous intensity, in Miss Chancellor's lap. Verena remained a moment, looking up at her, and then said:

"There is something I want to tell you now, without a moment's delay; something I didn't tell you at the time it happened, nor afterwards. Mr. Ransom came out to see me once, at Cambridge, a little while before we went to New York. He spent a couple of hours with me; we took a walk together and saw the colleges. It was after that that he wrote to me—when I answered his letter, as I told you in New York. I didn't tell you then of his visit. We had a great deal of talk about him, and I kept that back. I did so on purpose; I can't explain why, except that I didn't like to tell you, and that I thought it better. But now I want you to know everything; when you know that, you *will* know everything. It was only one visit—about two hours. I en-

joyed it very much—he seemed so much interested. One reason I didn't tell you was that I didn't want you to know that he had come on to Boston, and called on me in Cambridge, without going to see you. I thought it might affect you disagreeably. I suppose you will think I deceived you; certainly I left you with a wrong impression. But now I want you to know all—all!”

Verena spoke with breathless haste and eagerness; there was a kind of passion in the way she tried to expiate her former want of candor. Olive listened, staring; at first she seemed scarcely to understand. But Verena perceived that she understood sufficiently when she broke out: “You deceived me—you deceived me! Well, I must say I like your deceit better than such dreadful revelations! And what does anything matter when he has come after you now? What does he want—what has he come for?”

“He has come to ask me to be his wife.”

Verena said this with the same eagerness, with as determined an air of not incurring any reproach this time. But as soon as she had spoken she buried her head in Olive's lap.

Olive made no attempt to raise it again, and returned none of the pressure of her hands; she only sat silent for a time, during which Verena wondered that the idea of the episode at Cambridge, laid bare only after so many months, should not have struck her more deeply. Presently she saw it was because the horror of what had just happened drew her off from it. At last Olive asked: “Is that what he told you off there by the water?”

“Yes,”—and Verena looked up,—“he wanted me to know it immediately. He says it's only fair to you that he should give notice of his intentions. He wants to try and make me like him—so he says. He wants to see more of me, and he wants me to know him better.”

Olive lay back in her chair, with dilated eyes and parted lips. “Verena Tarrant, what is there between you? what *can* I hold on to, what *can* I believe? Two hours, in Cambridge, before we went to New York?” The sense that Verena had been monstrous there—monstrous in her reticence—now began to roll over her. “Mercy of Heaven, how you did act!”

“Olive, it was to spare you.”

“To spare me? If you really wished to spare me, he wouldn't be here now!”

Miss Chancellor flashed this out with a sudden violence, a spasm which threw Verena off and made her rise to her feet. For an instant the two young women stood confronted, and a person who had seen them at

that moment might have taken them for enemies rather than friends. But any such opposition could last but a few seconds. Verena replied, with a tremor in her voice which was not that of passion, but of charity: “Do you mean that I expected him, that I brought him? I never in my life was more surprised at anything than when I saw him there.”

“Hasn't he the delicacy of one of his own slave-drivers? Doesn't he know you loathe him?”

Verena looked at her friend with a degree of majesty which, with her, was rare. “I don't loathe him—I only dislike his opinions.”

“Dislike! Oh, misery!” And Olive turned away to the open window, leaning her forehead against the lifted sash.

Verena hesitated, then went to her, passing her arm round her. “Don't scold me! help me—help me!” she murmured.

Olive gave her a sidelong look; then, catching her up and facing her again—“Will you come away, now, by the next train?”

“Flee from him again, as I did in New York? No, no, Olive Chancellor, that's not the way,” Verena went on, reasoningly, as if all the wisdom of the ages were seated on her lips. “Then how can we leave Miss Birdseye, in her state? We must stay here—we must fight it out here.”

“Why not be honest, if you have been false—really honest, not only half so? Why not tell him plainly that you love him?”

“Love him, Olive? why, I scarcely know him.”

“You'll have a chance, if he stays a month.”

“I don't dislike him, certainly, as you do. But how can I love him when he tells me he wants me to give up everything, all our work, our faith, our future, never to give another address, to open my lips in public? How can I consent to that?” Verena went on, smiling strangely.

“He asks you that, just that way?”

“No; it's not that way. It's very kindly.”

“Kindly? Heaven help you, don't grovel! Doesn't he know it's my house?” Olive added, in a moment.

“Of course he won't come into it, if you forbid him.”

“So that you may meet him in other places—on the shore, in the country?”

“I certainly shan't avoid him, hide away from him,” said Verena proudly. “I thought I made you believe, in New York, that I really cared for our aspirations. The way for me, then, is to meet him, feeling conscious of my strength. What if I do like him? what does it matter? I like my work in the world, I like everything I believe in, better.”

Olive listened to this, and the memory of how, in the house in Tenth street, Verena had rebuked her doubts, professed her own faith anew, came back to her with a force which made the present situation appear slightly less terrific. Nevertheless, she gave no assent to the girl's logic; she only replied: "But you didn't meet him there; you hurried away from New York, after I was willing you should stay. He affected you very much there; you were not so calm when you came back to me from your expedition to the park, as you pretend to be now. To get away from him, you gave up all the rest."

"I know I wasn't so calm. But now I have had three months to think about it—about the way he affected me there. I take it very quietly."

"No, you don't; you are not calm now."

Verena was silent a moment, while Olive's eyes continued to search her, accuse her, condemn her. "It's all the more reason you shouldn't give me stab after stab," she replied, with a gentleness which was infinitely touching.

It had an instant effect upon Olive; she burst into tears, threw herself upon her friend's neck. "Oh, don't desert me—don't desert me, or you'll kill me in torture," she moaned, shuddering.

"You must help me—you must help me!" cried Verena, imploringly too.

XXXVII.

BASIL RANSOM spent a month at Marmion; in announcing this fact I am very conscious of its extraordinary character. Poor Olive may well have been startled to sharp pain at his presenting himself there; for after her return from New York she took to her soul the conviction that they had really done with him. Not only did the impulse of revulsion under which Verena had demanded that their departure from Tenth street should be immediate appear to her a proof that it had been sufficient for her young friend to touch Mr. Ransom's moral texture with her finger, as it were, in order to draw back forever, but what she had learned from her companion of his own manifestations, his apparent disposition to throw up the game, added to her feeling of security. He had spoken to Verena of their little excursion as his last opportunity, let her know that he regarded it not as the beginning of a more intimate acquaintance, but as the end even of such relations as already existed between them. He gave her up, for reasons best known to himself; if he wanted to frighten Olive he judged that he had frightened her enough; his Southern chivalry suggested to him, perhaps, that he ought to let her off be-

fore he had worried her to death. Doubtless, too, he had perceived how vain it was to hope to make Verena abjure a faith so solidly founded; and though he admired her enough to wish to possess her on his own terms, he shrank from the mortification which the future would have in keeping for him—that of finding that, after six months of courting, and in spite of all her sympathy, her desire to do what people expected of her, she despised his opinions as much as the first day. Olive Chancellor was able to a certain extent to believe what she wished to believe, and that was one reason why she had twisted Verena's flight from New York, just after she let her friend see how much she should like to drink deeper of the cup, into a warrant for living in a fool's paradise. If she had been less afraid, she would have read things more clearly. She would have seen that we don't run away from people unless we fear them, and that we don't fear them unless we know that we are unarmed. Verena feared Basil Ransom now (though this time she declined to run); but now she had taken up her weapons, she had told Olive she was exposed, she had asked *her* to be her defense. Poor Olive had been sickened as she had never been before; but the extremity of her danger gave her a desperate energy. The only comfort in her situation was that this time Verena had confessed her peril, had thrown herself into her hands. "I like him,—I can't help it,—I do like him. I don't want to marry him, I don't want to embrace his ideas, which are unspeakably false and horrible; but I like him better than any gentleman I have seen." So much as this the girl announced to her friend as soon as the conversation of which I have just given a sketch was resumed, as it was very soon, you may be sure, and very often, in the course of the next few days. That was her way of saying that a great crisis had arrived in her life, and the statement needed very little amplification to stand as a shy avowal that she too had succumbed to the universal passion. Olive had had her suspicions, her terrors, before; but she perceived now how idle and foolish they had been, and that this was a different affair from any of the "phases" of which she had hitherto anxiously watched the development. As I say, she felt it to be a considerable mercy that Verena's attitude was frank, for it gave her something to take hold of; she could no longer be put off with sophistries about receiving visits from handsome and unscrupulous young men for the sake of the opportunities it gave one to convert them. She took hold, accordingly, with passion, with fury; after the shock of Ransom's arrival had passed away she determined that he should not find her chilled into

dumb submission. Verena had told her that she wanted her to hold her tight, to rescue her; and there was no fear that, for an instant, she should sleep at her post.

"I like him — I like him; but I want to hate —"

"You want to hate him!" Olive broke in.

"No, I want to hate my liking. I want you to keep before me all the reasons why I should — many of them so fearfully important. Don't let me lose sight of anything! Don't be afraid I shall not be grateful when you remind me."

That was one of the singular speeches that Verena made in the course of their constant discussion of the terrible question, and it must be confessed that she made a great many. The strangest of all was when she protested, as she did again and again to Olive, against the idea of their seeking safety in retreat. She said there was a want of dignity in it — that she had been ashamed, afterwards, of what she had done in rushing away from New York. This care for her moral appearance was, on Verena's part, something new; inasmuch as, though she had struck that note on previous occasions,—had insisted on its being her duty to face the accidents and alarms of life,—she had never erected such a standard in the face of a disaster so sharply possible. It was not her habit either to talk or to think about her dignity, and when Olive found her taking that tone she felt more than ever that the dreadful, ominous, fatal part of the situation was simply that now, for the first time in all the history of their sacred friendship, Verena was not sincere. She was not sincere when she told her that she wanted to be helped against Mr. Ransom—when she exhorted her that way, to keep everything that was salutary and fortifying before her eyes. Olive didn't go so far as to believe that she was playing a part, and putting her off with words which, glossing over her treachery, only made it more cruel; she would have admitted that that treachery was as yet unwitting, that Verena deceived herself first of all, and thought she really wished to be saved. Her phrases about her dignity were insincere, her pretext that they must stay to look after Miss Birdseye; as if Doctor Prance were not abundantly able to discharge that function, and would not be enchanted to get them out of the house! Olive had perfectly divined by this time that Doctor Prance had no sympathy with their movement, no general ideas; that she was simply shut up to petty questions of pathological science and of her own professional activity. She would never have invited her down if she had realized this in advance, so much as the doctor's dry detach-

ment from all their discussions, their readings and practicing, her constant expeditions to fish and botanize, subsequently enabled her to do. She was very narrow, but it did seem as if she knew more about Miss Birdseye's peculiar physical conditions — they were *very* peculiar — than any one else, and this was a comfort at a time when that admirable woman seemed to be suffering a loss of vitality.

"The great point is that it must be met some time, and it will be a tremendous relief to have it over. He is determined to have it out with me, and if the battle doesn't come off to-day we shall have to fight it to-morrow. I don't see why this isn't as good a time as any other. My lecture for the Music Hall is as good as finished, and I haven't got anything else to do; so I can give all my attention to our personal struggle. It requires a good deal, you would admit, if you knew how wonderfully he can talk. If we should leave this place to-morrow, he would come after us to the very next one. He would follow us everywhere. A little while ago we could have escaped him, because he says that then he had no money. He hasn't got much now, but he has got enough to pay his way. He is so encouraged by the reception of his article by the editor of the 'Rational Review' that he is sure that in future his pen will be a resource."

These remarks were uttered by Verena after Basil Ransom had been three days at Marmion, and when she reached this point her companion interrupted her with the inquiry, "Is that what he proposes to support you with — his pen?"

"Oh, yes; of course he admits we should be terribly poor."

"And this vision of a literary career is based entirely upon an article that hasn't yet seen the light? I don't see how a man of any refinement can approach a woman with so beggarly an account of his position in life."

"He says he wouldn't — he would have been ashamed — three months ago; that was why, when we were in New York, and he felt, even then — well (so he says) all he feels now, he made up his mind not to persist, to let me go. But just lately a change has taken place; his state of mind altered completely, in the course of a week, in consequence of the letter that editor wrote him about his contribution. It was a remarkably flattering letter. He says he believes in his future now; he has before him a vision of distinction, of influence, and of fortune, not great, perhaps, but sufficient to make life tolerable. He doesn't think life is very delightful, in the nature of things; but one of the best things a man can do with it is to get hold of some woman (of course, she must please him very much, to

make it worth while) whom he may draw close to him."

"And couldn't he get hold of any one but you — among all the exposed millions of our sex?" poor Olive groaned. "Why must he pick you out, when everything he knew about you showed you to be, exactly, the very last?"

"That's just what I have asked him, and he only remarks that there is no reasoning about such things. He fell in love with me that first evening, at Miss Birdseye's. So you see there was some ground for that mystic apprehension of yours. It seems as if I pleased him more than any one."

Olive flung herself over on the couch, burying her face in the cushions, which she tumbled in her despair, and moaning out that he didn't love Verena, he never had loved her, it was only his hatred of their cause that made him pretend it; he wanted to do that an injury, to do it the worst he could think of. He didn't love her, he hated her, he only wanted to smother her, to crush her, to kill her — as she would infallibly see that he would if she listened to him. It was because he knew that her voice had magic in it, and from the moment he caught its first note he had determined to destroy it. It was not tenderness that moved him — it was devilish malignity; tenderness would be incapable of requiring the horrible sacrifice that he was not ashamed to ask, of requiring her to commit perjury and blasphemy, to desert a work, an interest, with which her very heart-strings were interlaced, to give the lie to her whole young past, to her purest, holiest ambitions. Olive put forward no claim of her own, breathed, at first, at least, not a word of remonstrance in the name of her personal loss, of their blighted union; she only dwelt upon the unspeakable tragedy of a defection from their standard, of a failure on Verena's part to carry out what she had undertaken, of the horror of seeing her bright career blotted out with darkness and tears, of the joy and elation that would fill the breast of all their adversaries at this illustrious, consummate proof of the fickleness, the futility, the predestined servility of women. A man had only to whistle for her, and she who had pretended most was delighted to come and kneel at his feet. Olive's most passionate protest was summed up in her saying that if Verena were to forsake them it would put back the emancipation of women a hundred years. She did not, during these dreadful days, talk continuously; she had long periods of pale, intensely anxious, watchful silence, interrupted by outbreaks of passionate argument, entreaty, invocation. It was Verena who talked incessantly, Verena who was in a state entirely new to her, and,

as any one could see, in an attitude entirely unnatural and overdone. If she was deceiving herself, as Olive said, there was something very affecting in her effort, her ingenuity. If she tried to appear to Olive impartial, coldly judicious, in her attitude with regard to Basil Ransom, and only anxious to see, for the moral satisfaction of the thing, how good a case, as a lover, he might make out for himself, and how much he might touch her susceptibilities, she endeavored, still more earnestly, to practice this fraud upon her own imagination. She abounded in every proof that she should be in despair if she should be overborne, and she thought of arguments even more convincing, if possible, than Olive's, why she should hold on to her old faith, why she should resist even at the cost of acute temporary suffering. She was voluble, fluent, feverish; she was perpetually bringing up the subject, as if to encourage her friend, to show how she kept possession of her judgment, how independent she remained.

No stranger situation can be imagined than that of these extraordinary young women at this juncture; it was so singular on Verena's part, in particular, that I despair of presenting it to the reader with the air of reality. To understand it, one must bear in mind her peculiar frankness, natural and acquired, her habit of discussing questions, sentiments, moralities, her education, in the atmosphere of lecture-rooms, of séances, her familiarity with the vocabulary of emotion, the mysteries of "the spiritual life." She had learned to breathe and move in a rarefied air, as she would have learned to speak Chinese if her success in life had depended upon it; but this dazzling trick, and all her artlessly artful facilities, were not a part of her essence, an expression of her innermost preferences. What *was* a part of her essence was the extraordinary generosity with which she could expose herself, give herself away, turn herself inside out, for the satisfaction of a person who made demands of her. Olive, as we know, had made the reflection that no one was naturally less preoccupied with the idea of her dignity, and though Verena put it forward as an excuse for remaining where they were, it must be admitted that in reality she was very deficient in the desire to be consistent with herself. Olive had contributed with all her zeal to the development of Verena's gift; but I scarcely venture to think, now, what she may have said to herself, in the secrecy of deep meditation, about the consequences of cultivating an abundant eloquence. Did she say that Verena was attempting to smother her now in her own phrases? did she view with dismay the fatal effect of trying to have an answer for everything? From Ol-

ive's condition during these lamentable weeks there is a certain propriety — a delicacy enjoined by the respect for misfortune — in averting our head. She neither ate nor slept; she could scarcely speak without bursting into tears; she felt so implacably, insidiously baffled. She remembered the magnanimity with which she had declined (the winter before the last) to receive the vow of eternal maidenhood which she had at first demanded, and then put by as too crude a test, but which Verena, for a precious hour, forever flown, would *then* have been willing to take. She repented of it with bitterness and rage; and then she asked herself, more desperately still, whether even if she held that pledge she should be brave enough to enforce it in the face of actual complications. She believed that if it were in her power to say, "No, I won't let you off; I have your solemn word, and I won't!" Verena would bow to that decree and remain with her; but the magic would have passed out of her spirit forever, the sweetness out of their friendship, the efficacy out of their work. She said to her again and again that she had utterly changed since that hour she came to her, in New York, after her morning with Mr. Ransom, and sobbed out that they must hurry away. Then she had been wounded, outraged, sickened, and in the interval nothing had happened, nothing but that one exchange of letters, which she knew about, to bring her round to a shameless tolerance. Shameless Verena admitted it to be; she assented over and over to this proposition, and explained, as eagerly each time as if it were the first, what it was that had come to pass, what it was that had brought her round. It had simply come over her that she liked him, that that was the true point of view, the only one from which one could consider the situation in a way that would lead to what she called a *real* solution — a permanent rest. On this particular point Verena never responded, in the liberal way I have mentioned, without asseverating at the same time that what she desired most in the world was to prove (the picture Olive had held up from the first) that a woman *could* live on persistently, clinging to a great, vivifying, redemptory idea, without the help of a man. To testify to the end against the stale superstition — mother of every misery — that those gentry were as indispensable as they had proclaimed themselves on the house-tops — that, she passionately protested, was as inspiring a thought in the present poignant crisis as it had ever been.

The one grain of comfort that Olive extracted from the terrors that pressed upon her was that now she knew the worst; she knew it since Verena had told her, after so long and

so ominous a reticence, of the detestable episode at Cambridge. That seemed to her the worst, because it had been thunder in a clear sky; the incident had sprung from a quarter from which, months before, all symptoms appeared to have vanished. Though Verena had now done all she could to make up for her perfidious silence by repeating everything that passed between them as she sat with Mr. Ransom in Monadnoc Place or strolled with him through the colleges, it imposed itself upon Olive that that occasion was the key of all that had happened since, that he had then obtained an irremediable hold upon her. If Verena had spoken at the time, she would never have let her go to New York; the sole compensation for that hideous mistake was that the girl, recognizing it to the full, evidently deemed, now, that she couldn't be communicative enough. There were certain afternoons in August, long, beautiful, and terrible, when one felt that the summer was rounding its curve, and the rustle of the full-leaved trees in the slanting golden light, in the breeze that ought to be delicious, seemed the voice of the coming autumn, of the warnings and dangers of life — portentous, insufferable hours when, as she sat under the softly swaying vine-leaves of the trellis with Miss Birdseye, and tried, in order to still her nerves, to read something aloud to her guest, the sound of her own quivering voice made her think more of that baleful day at Cambridge than of the fact that at that very moment Verena was "off" with Mr. Ransom — had gone to take the little daily walk with him to which it had been arranged that their enjoyment of each other's society should be reduced. Arranged, I say; but that is not exactly the word to describe the compromise arrived at by a kind of tacit exchange of tearful entreaty and tightened grasp, after Ransom had made it definite to Verena that he *was* going to stay a month, and she had promised that she would not resort to base evasions, to flight (which would avail her nothing, he notified her), but would give him a chance, would listen to him a few minutes every day. He had insisted that the few minutes should be an hour, and the way to spend it was obvious. They wandered along the waterside to a rocky, shrub-covered point, which made a walk of just the right duration. Here all the homely languor of the region, the mild, fragrant Cape-quality, the sweetness of white sands, quiet waters, low promontories where there were paths among the barberries, and tidal pools gleamed in the sunset,—here, I say, all the spirit of a ripe summer afternoon seemed to hang in the air. There were wood-walks too; they sometimes followed bosky uplands,

where accident had grouped the trees with odd effects of "style," and where in grassy intervals and fragrant nooks of rest they came out upon sudden patches of Arcady. In such places Verena listened to her companion with her watch in her hand, and she wondered, very sincerely, how he could care for a girl who made the conditions of courtship so odious. He had recognized, of course, at the very first, that he could not inflict himself again upon Miss Chancellor, and after that awkward morning call I have described he did not again, for the first three weeks of his stay at Marmion, penetrate into the cottage whose back windows overlooked the deserted shipyard. Olive, as may be imagined, made, on this occasion, no protest for the sake of being ladylike, or of preventing him from putting her apparently in the wrong. The situation between them was too grim; it was war to the knife, it was a question of which should pull hardest. So Verena took a tryst with the young man as if she had been a maid-servant and Basil Ransom a "follower." They met a little way from the house; beyond it, outside the village.

XXXVIII.

OLIVE thought she knew the worst, as we have perceived; but the worst was really something she couldn't know, inasmuch as, up to this time, Verena chose to confide to her as little on that one point as she was careful to expatiate with her on every other. The change that had taken place in the object of Basil Ransom's meddlesome devotion since the episode in New York was, briefly, just this change—that the words he had spoken to her there about her genuine vocation, as distinguished from the hollow and factitious ideal with which her family and her association with Olive Chancellor had saddled her—these words, the most effective and penetrating he had uttered, had sunk into her soul and worked and fermented there. She had come at last to believe them, and that was the alteration, the transformation. They had kindled a light in which she saw herself afresh, and, strange to say, liked herself better than in the old exaggerated glamour of the lecture-lamps. She couldn't tell Olive that yet, for it struck at the root of everything, and the dreadful, delightful sensation filled her with a kind of awe at all that it implied and portended. She was to burn everything she had adored; she was to adore everything she had burned. The extraordinary part of it was that though she felt the situation to be, as I say, tremendously serious, she was not ashamed of the treachery which she—yes, decidedly, by this time she must admit it to herself—she

meditated. It was simply that the truth had changed sides; that radiant image began to look at her from Basil Ransom's fuliginous eyes. She loved, she was in love—she felt it in every throb of her being. Instead of being constituted by nature for entertaining that sentiment in an exceptionally small degree (which had been the implication of her whole crusade, the warrant for her offer of old to Olive to renounce), she was framed, apparently, to allow it the largest range, the highest intensity. It was always passion, in fact; but now the object was other. Formerly she had been convinced that the fire of her spirit was a kind of double flame, one half of which was responsive friendship for a most extraordinary person, and the other pity for the sufferings of women in general. Verena gazed aghast at the colorless dust into which, in three short months (counting from the episode in New York), such a conviction as that could crumble; she felt it must be a magical touch that could bring about such a cataclysm. Why Basil Ransom had been deputed by fate to exercise this spell was more than she could say—poor Verena, who up to so lately had flattered herself that she had a wizard's wand in her own pocket.

When she saw him a little way off, about five o'clock,—the hour she usually went out to meet him,—waiting for her at a bend of the road which lost itself, after a winding, straggling mile or two, in the indented, insulated "point," where the wandering bee droned through the hot hours with a vague, misguided flight, she felt that his tall, watching figure, with the low horizon behind, represented well the importance, the towering eminence he had in her mind—the fact that he was just now, to her vision, the most definite, most incomparable object in the world. If he had not been at his post when she expected him, she would have had to stop and lean against something for weakness; her whole being would have throbbed more painfully than it throbbed at present, though seeing him there made her nervous enough. And who was he; what was he? she asked herself. What did he offer her besides a chance (in which there was no compensation of brilliancy or fashion) to falsify, in a conspicuous manner, every hope and pledge she had hitherto given? He allowed her, certainly, no illusion on the subject of the fate she should meet as his wife; he flung over it no rosininess of promised ease; he let her know that she should be poor, withdrawn from view, a partner of his struggle, of his severe, rather cynical stoicism. When he spoke of such things as these, and bent his eyes on her, she could not keep the tears from her own; she felt that to throw herself into

his life (bare and arid as for the time it was) was the condition of happiness for her, and yet that the obstacles were terrible, cruel. It must not be thought that the revolution which was taking place in her was unaccompanied with suffering. She suffered less than Olive certainly, for her bent was not, like her friend's, in that direction; but as the wheel of her experience went round she had the sensation of being ground very small indeed. With her light, bright texture, her complacent responsiveness, her genial, graceful, ornamental cast, her desire to keep on pleasing others at the time when a force she had never felt before was pushing her to please herself, poor Verena lived in these days in a state of moral tension — with a sense of being strained and aching — which she didn't betray more only because it was absolutely not in her power to look haggard. An immense pity for Olive sat in her heart, and she asked herself how far it was necessary to go in the path of self-sacrifice. Nothing was wanting to make the wrong she should do her complete; she had deceived her up to the very last; only three months before she had reasserted her vows, given her word, with every show of fidelity and enthusiasm. There were hours when it seemed to Verena that she must really push her inquiry no further, but content herself with the conclusion that she loved as deeply as a woman could love, and that it didn't make any difference. She felt Olive's grasp too clinching, too terrible. She said to herself that she should never dare, that she might as well give up early as late; that the scene, at the end, would be something she couldn't face; that she had no right to blast the poor creature's whole future. She had a vision of those dreadful years; she knew that Olive would never get over the disappointment. It would touch her in the point where she felt everything most keenly; she would be incurably lonely and eternally humiliated. It was a very peculiar thing, their friendship; it had elements which made it probably as complete as any (between women) that had ever existed. Of course it had been more on Olive's side than on hers, she had always known that; but that, again, didn't make any difference. It was of no use for her to tell herself that Olive had begun it entirely, and she had only responded out of a kind of charmed politeness, at first, to a tremendous appeal. She had lent herself, given herself, utterly, and she ought to have known better if she didn't mean to abide by it. At the end of three weeks she felt that her inquiry was complete, but that after all nothing was gained except an immense interest in Basil Ransom's views, and the prospect of an eternal heartache. He

had told her he wanted her to know him, and now she knew him pretty thoroughly. She knew him and she adored him, but it didn't make any difference. To give him up or to give Olive up — this effort would be the greater of the two.

If Basil Ransom had the advantage, as far back as that day in New York, of having struck a note which was to reverberate, it may easily be imagined that he did not fail to follow it up. If he had projected a new light into Verena's mind, and made the idea of giving herself to a man more agreeable to her than that of giving herself to a movement, he found means to deepen this illumination, to drag her former standard in the dust. He was in a very odd situation indeed; carrying on his siege with his hands tied. As he had to do everything in an hour a day, he perceived that he must confine himself to the essential. The essential was to show her how much he loved her, and then to press, to press, always to press. His hovering about Miss Chancellor's habitation without going in was a strange regimen to be subjected to, and he was sorry not to see more of Miss Birdseye, besides often not knowing what to do with himself in the mornings and evenings. Fortunately he had brought plenty of books (volumes of rusty aspect, picked up at New York bookstalls), and in such an affair as this he could take the less when the more was forbidden him. For the mornings, sometimes, he had the resource of Doctor Prance, with whom he made a great many excursions on the water. She was devoted to boating and an ardent fisherwoman, and they used to pull out into the bay together, cast their lines, and talk a prodigious amount of heresy. She met him, as Verena met him, "in the environs," but in a different spirit. He was immensely amused at her attitude, and saw that nothing in the world could, as he expressed it, make her wink. She would never blench nor show surprise. She had an air of taking everything abnormal for granted; betrayed no consciousness of the oddity of Ransom's situation; said nothing to indicate she had noticed that Miss Chancellor was in a frenzy or that Verena had a daily appointment. You might have supposed from her manner that it was as natural for Ransom to sit on a fence half a mile off as in one of the red rocking-chairs, of the so-called "Shaker" species, which adorned Miss Chancellor's back veranda. The only thing our young man didn't like about Doctor Prance was the impression she gave him (from her little slit-like tacit sources he scarcely knew how he gathered it) that she thought Verena rather slim. She took an ironical view of almost any kind of

courtship, and he could see she didn't wonder women were such featherheads, so long as, whatever thin follies they cultivated, they could get men to come and sit on fences for them. Doctor Prance told him Miss Birdseye noticed nothing; she had sunk, within a few days, into a kind of transfigured torpor; she didn't seem to know whether Mr. Ransom were anywhere round or not. She guessed she thought he had just come down for a day and gone off again; she probably supposed he just wanted to get toned up a little by Miss Tarrant. Sometimes, out in the boat, when she looked at him in vague, good-humored silence, while she waited for a bite (she delighted in a bite), she had an expression of diabolical shrewdness. When Ransom was not scorching there beside her (he didn't mind the sun of Massachusetts), he lounged about in the pastoral land which hung (at a very moderate elevation) above the shore. He always had a book in his pocket, and he lay under whispering trees and kicked his heels and made up his mind on what side he should take Verena the next time. At the end of a fortnight he had succeeded (so he believed, at least) far better than he had hoped, in this sense, that the girl had now the air of making much more light of her "gift." He was indeed quite appalled at the facility with which she threw it over, gave up the idea that it was useful and precious. That had been what he wanted her to do, and the fact of the sacrifice (once she had fairly looked at it) costing her so little only proved his contention, only made it clear that it was not necessary to her happiness to spend half her life ranting (no matter how prettily) in public. All the same he said to himself that, to make up for the loss of whatever was sweet in the reputation of the thing, he should have to be tremendously nice to her in all the coming years. During the first week he was at Marmion she made of him an inquiry which touched on this point.

"Well, if it's all a mere delusion, why should this facility have been given me—why should I have been saddled with a superfluous talent? I don't care much about it—I don't mind telling you that; but I confess I should like to know what is to become of all that part of me, if I retire into private life, and live, as you say, simply to be charming for you. I shall be like a singer with a beautiful voice (you have told me yourself my voice is beautiful) who has accepted some decree of never raising a note. Isn't that a great waste, a great violation of nature? Were not our talents given

us to use, and have we any right to smother them and deprive our fellow-creatures of such pleasure as they may confer? In the arrangement you propose" (that was Verena's way of speaking of the question of their marriage) "I don't see what provision is made for my poor dear little disfranchised eloquence. It is all very well to be charming to you, but there are people who have told me that, once I get on a platform, I am charming to all the world. There is no harm in my speaking of that, because you have told me so yourself. Perhaps you intend to have a platform erected in our front parlor, where I can address you every evening, and put you to sleep after your work. I say our *front* parlor, as if it were certain we should have two! It doesn't look as if our means would permit that—and we must have some place to dine, if there is to be a platform in our sitting-room."

"My dear young woman, it will be easy to solve the difficulty: the dining-table itself shall be our platform, and you shall mount on top of that." This was Basil Ransom's sportive reply to his companion's very natural appeal for light, and the reader will remark that if it led her to push her investigation no further, she was very easily satisfied. There was more reason, however, as well as more appreciation of a very considerable mystery, in what he went on to say. "Charming to me, charming to all the world? What will become of your charm?—is that what you want to know? It will be about five thousand times greater than it is now; that's what will become of it. We shall find plenty of room for your facility; it will lubricate our whole existence. Believe me, Miss Tarrant, these things will take care of themselves. You won't sing in the Music Hall, but you will sing to me; you will sing to every one who knows you and approaches you. Your gift is indestructible; don't talk as if I either wanted to wipe it out or should be able to make it a particle less divine. I want to give it another direction, certainly; but I don't want to stop your activity. Your gift is the gift of expression, and there is nothing I can do for you that will make you less expressive. It won't gush out at a fixed hour and on a fixed day, but it will irrigate, it will fertilize, it will brilliantly adorn your conversation. Think how delightful it will be when your influence becomes really social. Your facility, as you call it, will simply make you, in conversation, the most charming woman in America."

Henry James.

(To be continued.)

THE SOLITARY KNIGHT.

MIDSUMMER EVE. The horseman stays to rest.
Looking to seaward you could hardly know,
By wooded cape or headland in the west,
Whether to-day or thousand years ago.
What matter if in Alfred's time or now?
The same sky arches the same grass and tides,
The same vext hearts: forever runs the plough
Of change; form immaterial abides.

Beside him, on the wall that overtops
The bank above the shore where children play,
A lady sits, and ever on him drops
Her eyes aglow from flaming sky and bay:
The earth-old miracle before them wrought
Of water turned to streaming flood of fire,
Its source a sunset passing dreamer's thought,
A splendor baffling impotent desire.

Upon him, if he gazed or smiled or spoke,
She ever caught the semblance of a pall,
Impalpable as Indian-summer smoke,
Impenetrable as a crystal wall:
A vail intangible that drew between
Him and the friendliest face, the grasping hand,
And shut out half the solace of the scene
That touched with speechless grace all sea and land.

And, marveling, the lady pondered first,—
As in the story of the Christ 'tis told,—
“Was he for *his* sin or his parents' cursed?”
Then, conning the reply, and making bold
From her pure woman's heart (for she had heard
He was by men esteemed reproachless, brave,
And gentle that he would not harm a bird,
Yet scornful of each false and coward knave);

And doubting if her thought did not belie
So chivalrous a one of speech and hand,
And more by half-protesting smile and eye
Than word, she questioned why he was so banned.
Then looked he down at her, and bared his head,
And glanced up to the sky as if to plead;
And, deeply grave, he reverently said,—
“God knows. I only it was so decreed.

“Since I grew conscious, I have moved alone,
Threading the forest thick of trees or men,
To comrade as to stranger little known:
The nearest comes and looks and turns again.
And though I press in vanguard of the fray
And call the charge, and men spring on to see
My colors lead along the conquering way,—
My heart goes often to the enemy.

"And if I take a child, in hungry wise,
 And fondle him and fold him face on face,
 He lifts his head and looks with old, grave eyes
 On one he knows is foreign to his race."
 The lady, stung in her pure-hearted peace
 And vehement of eager pity, spoke,—
 "It cannot be. Can no one give release?
 Has no hand through this cruel prison broke?"

His face, as smitten by an arrow, dropped;
 And he awhile sat still as brooding bird,
 As still as though his breath and heart-beat stopped;
 Then, like one from enraptured vision stirred
 And softly, "There was one, I thought, that could,—
 That might this living cerement have spurned;
 And who, out of her strong compassion, would
 But that she could not, howsoe'er she yearned."

The lady scoffed a look, in bitter heart,
 At *could* and *could not*, and her eyes asked, "Why?"
 "Because," he said, "because she was a part
 And denizen of heaven bright and high;
 And how could she reach down to this far place?"
 A faint bell chimed. He pointed to the north;
 And long gazed on a paling golden space,
 As though a seraph beckoned leaning forth.

O'er sky and sea night pours her quenching tides,
 Veils gracious face, and merges wood and slope.
 "Good-night! good-night!" Into the dark he rides,
 With heart-of-grace, not hopeless nor in hope,
 But bending back his head like one in fight
 Who feels the vital hurt and will not yield
 But urges on till, battle-faint at night,
 He may lie down upon the trodden field.

Darkly he rides, not more of purpose blind
 By searching to find out the Unsearchable;
 As sure that, though it mock this sense confined,
 In unimaginable ways 'tis well;
 Not less his path assigned, in order set
 With wheeling sphere and comet flaming far;
 Nor more unnoted in his round, nor yet
 Less lonely than yon ether-threading star.

James T. McKay.

AN AMERICAN LORDSHIP.

AT THE LANDING, GARDINER'S ISLAND.

ON an ancient brown-stone tablet raised upon four legs above a grave in one of the old burial-grounds of New London, may be found a knightly coat-of-arms cut upon a piece of slate which has been let into the larger slab; underneath the coat-of-arms appears this inscription:

"Here lyeth buried ye body of his excellency John Gardiner, Third Lord of ye Isle of Wight. He was born April 19th, 1661, and departed this life June 25th, 1738."

Here is a puzzle for any one who should come upon it without knowledge of the facts which explain it! Why should the ashes of a lord be deposited on New London soil, and how did it happen that a nobleman from the Isle of Wight should have come so far to die? These are the questions one would naturally ask. But he would find, on searching, that there is no "Lord of the Isle of Wight" in the British peerage. The person here buried, then, must have been an American lord? That

is it, precisely. The Isle of Wight was the old name of what is now known as Gardiner's Island, lying off the eastern end of Long Island, and the John Gardiner above mentioned was the grandson of the first English settler in the province of New York.

Lion Gardiner, first English settler of New York, and founder of an estate which has ever since remained in the hands of his descendants, was a man of mark and service in his time, still known to students of colonial history; and his name, since extended to a numerous and wide-branching family, is inseparably connected with the manorial domain which he acquired in the New World. Yet very few, I suppose, among the three million inhabitants of the State,—even of those who have skirted the island in fishing-boats,—know more about him than I did when, a couple of years ago, I first sailed to those shores. Although one branch of the writer's family had, long ago, twice intermarried with the Gardiners of Gardiner's Island, I con-

fess that my ideas about Lion Gardiner were vague; and often as I had traversed the Sound, I had never looked upon the island, though it lies almost within sight from the deck of any Newport steamer, behind Plum Island and the Gulls, blending with the outlines of the Montauk promontory.

But even a nearer view from the water gives no adequate notion of the beauty and variety of the demesne. As the pretty sloop-yacht that carried us ran in to anchor near Home Pond, on the sheltered south-west side, we heard the notes of fish-hawks echoing, as if in surprise at the approach of visitors, over manor woods in which the gray trunks and branches of the outermost trees appeared curiously in-laid. Then came quite a different glimpse,—that of the manor-house (built in 1774), nestling among big-bolled cherry-trees, willows, and horse-chestnuts, behind a low ridge like a moraine, and guardedly overlooking the bay from six dormers in a single roof, to which time and sea air have given a mellow coat of greenish-orange moss. Nearer by stood the windmill that supplies flour for the whole population; it is close above the landing-place. The privacy of the manor is protected by the absence of a wharf, and to get ashore and off again is not always an easy matter; but, once on land and across the sandy beach, we found the spot charming. The high, rolling downs called “commons,” behind the mansion, end towards the north and west in rich and glorious woods containing more than a few trees of primeval growth; and the other half of the island is not only supplied with woods, but also with orchards and broad tracts of grain. The nearest land is three miles and a half distant, at Fireplace. Shelter Island on the west, and the north and south arms of Long Island, help to convert Gardiner’s Bay into a spacious roadstead (where the British fleet lay anchored during a part of the Revolutionary War); but from the high bluffs on the east you gaze upon the open Atlantic. A solid bit of earth, seven miles long and from one mile to two miles wide, with a circuit of twenty, it incloses three thousand good acres, and lies completely undisturbed in the busy track of commerce,—an ancestral property which seems to have conferred upon the present owner, besides its more tangible qualities, the comfortable repose of the past.

Gardiner’s Island was the first founded of the old manors of New York, and it is the only one of them that has remained intact. Not a foot of the ground has ever been owned by any but a Gardiner since it first passed from the possession of the Indians, two hun-

dred and fifty years ago; and all persons living on the island, apart from members of that family, have been servants, slaves, or tenants of the proprietor. All the tenants to-day, numbering from forty-five to sixty, are employed by the owner of the estate; the only exception to what I have said being that the United States has taken a small reservation of sand-spit at the north-west extremity for its lighthouse. Moreover, besides being a manor, Gardiner’s Island was a lordship; for the terms of Governor Dongan’s confirmatory grant in 1686 were, “do erect and constitute the said Island . . . one Lordship and Manor to all intents and purposes, and the said Island shall henceforth be called THE LORDSHIP AND MANOR OF GARDINER’S ISLAND.” Hence the title recorded on the tomb of John, third proprietor, at New London.

But I am forgetting old Lion Gardiner. That was his rugged way of spelling his name; and when one learns that he was three months and ten days on the voyage from Gravesend to Boston, in a twenty-five-ton barque, one is tempted to call him a *sea-Lion*.* The common noun, however, is more applicable to his courage as a fighter. In the inventory of his personal property, drawn up at his death, one item reads, “piece of a corselet.” Where that old scrap of armor has gone to is unknown; but by furnishing it up in imagination, adding a steel cap, a buff coat and cross-belt, a “sword, pistols, and carbine” mentioned by himself, and grouping a few historical facts around these properties, we can make out a fairly life-like figure of the hardy colonial warrior. In the time of Charles I. he went from England to Holland to serve there as lieutenant with the English allies under Lord Vere. He married a Dutch lady, Mary Willemson, daughter of a “*deurcant*” in the town of Woerden, and became, by his own account, “an engineer and master of works of fortification in the legers of the Prince of Orange, in the Low Countries.” But, being a friend of the Puritans and a Parliament man, he was engaged in 1635 by Lord Say and Seal, with other nobles and gentry, to go to the new plantation of Connecticut, under John Winthrop the younger, and to build a fort at the mouth of the river. He set sail in the barque *Bachelor*—odd circumstance, considering that he was a pioneer of population, destined to be the father of the first English child born in Connecticut and afterwards the first English child born in New York! At Boston he was induced to stay long enough to take charge of and complete the military works on Fort Hill—those that Jocelyn described, later

* It may be noted, by the way, that Cooper’s novel, “The Sea-Lions,” opens at Oyster Ponds, Long Island, some twelve miles direct sail across from the manor; and that the hero of that book is named Gardiner.

on, as mounted with "loud babbling guns." Arrived at the mouth of the Connecticut, he proceeded to construct, amid the greatest difficulties, and though he had but few men to aid him, a strong fort of hewn timber —

to a still more secluded home; purchasing Manchonake — which signified "place where many had died" (of a pestilence) — from the Paumanoc Indians, for "ten coats of trading cloth." Manchonake, or the Isle of Wight,

THE MANOR-HOUSE, GARDINER'S ISLAND.

with a ditch, drawbridge, palisade, and rampart — which he named Saybrook. It was the first stronghold erected in New England outside of Boston. An old Geneva Bible (dating from 1599), now at Gardiner's Island, contains an entry in antique and much faded writing, probably copied from some earlier record made by Lion himself. Those crabbed characters speak faintly from the yellowed page as with his own voice, through the centuries, thus:

"In the yeare of our Lord 1635, July the 10th, came I, Lion Gardiner and Mary my wife, from Woerdon, a towne in Holland. . . . We came from Woerdon to London, and from thence to New England, and dwelt at Saybrook forte four years, of which I was commander; and there was borne unto me a son named David, in 1636, April the 29, the first born in that place. . . . And then I went to an island of mine owne, which I bought of the Indians, called by them Manchonake, by us the Isle of Wite."

The four years at Saybrook fort were years of hard work, of anxiety, danger, and active warfare with the Pequots, diversified by agriculture carried on under the enemy's fire and efforts to strengthen the plantation. Gardiner himself was severely wounded in one close encounter; but he had the satisfaction, in 1637, of aiding in the plans which resulted in the defeat and almost the annihilation of the Pequots. When his engagement expired with the lords and gentlemen, nothing daunted by his hard experiences, he betook himself

now Gardiner's Island, was sixteen miles distant by water from the nearest settlement of English at Saybrook. Long Island and Shelter Island were still occupied by Indians; and the only inhabitants of Manchonake were Indians, who with their descendants remained tenants at will for three or four generations. But when we conceive of the isolation of the place at that time, we get some notion as to the sturdy self-reliance and unshaken courage of a man who, after a perilous voyage across the sea and a still more perilous sojourn in the wilds of "Kenneticot," was ready to plunge into a deeper solitude and sever himself from fellowship with the colonists, in his search for a permanent abode. He had seen men killed by the Pequots, or burned alive; and in his "Relation of the Pequot Wars" (written three years before his death), speaking of dangers still impending from the red tribes, he mildly says: "Now I am an old man I would fain die a natural death, or like a soldier in the field, with honor," and not be impaled, flayed, and have his flesh cut off piecemeal, to be roasted and thrust into his mouth, "as these people have done" to others. Small wonder that, with such memories, he should recall as "a pretty prank" played upon Pequots who were lurking near the fort at night, to set it afire, the following device. Large doors, stuck full of nails as sharp as awl-blades, were laid on the ground at the approaches; the Indians came, "and as they skipped from one they

SOME RELICS.

trod upon another, and left the nails and doors dyed with their blood, which you know we saw the next morning, laughing at it." His taste in the humorous had grown somewhat tough. But his tact and shrewdness had not been impaired; for, before going to his island, he made friends with Wyandance, afterwards chief of the Montauks, and he was as successful in cultivating peaceful relations with the Indians as he already had been in waging war against them. Twice he foiled conspiracies for a general onslaught on the English, by means of the warnings which his firm friend gave him. Another time he remained as hostage with the Indians, while Wyandance went before the English magistrates who had demanded that he should discover and give up certain murderers. Again, when Ninigret, chief of the Narragansetts, seized and carried off the daughter of Wyandance, on the night of her wedding, Gardiner succeeded in ransom and restoring her to the father. Wyandance, in gratitude, gave him a large tract of land westward along the Sound, which is now Smithtown; and when the sachem died, he left his son to the guardianship of Lion and his son David. Never, perhaps, has a more remarkable friendship between white man and red man been recorded. They acted in concert with entire mutual trust, keeping the Long Island tribes on peaceable terms with the English by swift and severe measures in case of wrongdoing, tempered with diplomacy, and with justice to both sides. Gardiner's Island was never in any way molested by the savages; and indeed, if Lion Gardiner's advice had been taken in the first instance, there might not have been a Pequot war.

Truly, this wise, brave, and able man makes an ideal First Settler. For thirteen years he remained on the island, exerting his good influence; at the same time developing his territory and deriving an income from the whale-fishery, which then flourished about eastern Long Island. Afterwards, leaving the isle in charge of the old soldiers whom he had brought from the fort as farmers, he passed ten years in East Hampton, where he had bought much land, and died there in 1663, at the age of sixty-four. The place of his sepulture is not known; but in the older East Hampton cemetery, among the graves of many Gardiners, may be seen two extremely ancient flat posts of "drift cedar" sunk deep in the soil and joined

THE GRAVEYARD, GARDINER'S ISLAND.

together by a rail of the same material, about the normal length of a man. The wood is mossy, is bleached and furrowed by time and weather. Under this primitive memorial, it has been surmised, rests the body of Lion Gardiner.

Lion bequeathed the island to his wife; and she at her death left it to their son David "in tail" to his first heir male and the first heirs male following, forever. David, in leaving it to his eldest son, reexpressed the entail; in 1829 by the death of the eighth proprietor without issue, the estate passed to his younger brother, after descending from father to son for more than a hundred and fifty years.

Lion Gardiner's right to the land by purchase from the Indians was confirmed by a grant from the agent of the Earl of Stirling, who obtained a reckless sort of patent from the King for an immense slice of territory, in which the island was embraced. But this grant allowed Gardiner to make and execute such laws as he pleased for church and civil government on his own land, if "according to God and the King," "*without giving any account thereof to any one whomsoever*"; and,

although David Gardiner formally acknowledged his submission to New York, hereceived from Governor Nicholls a renewal of his privileges for the consideration of five pounds in hand and a yearly rental to the same amount. The archives of the Hague show that the Dutch complained, so early as 1656, that the English had usurped "in the Krommegou [crooked district] what is called Garnaet's Island"; but the Dutch did not attack the usurper, and the island long remained an independent plantation tributary to the King. Each royal governor who came out to New York, by a species of "political assessment," levied a charge of five pounds for issuing a nice new parchment patent confirming the older ones; but at length Governor Dongan, for a considerable sum paid down, gave David Gardiner the patent which created the island a lordship and manor, and in so doing expressly agreed that the King would thenceforth accept, in lieu of all other tribute, one ewe lamb on the first of May in each year. David, the son of Lion, was thus the first of the family who was authorized to call himself a lord. The title does not seem to have been

much insisted upon by the owners; but it appears on the tombstone of David at Hartford (where he died suddenly and was buried), on John's tablet at New London, and on some of the slabs set up over the graves of Gardiners at East Hampton. It was also generally recognized by the contemporaries of these "lords of the isle." At all events, it gave me a vivid sense of their sovereignty to see the original voluminous document by which the title was conferred, now preserved at the manor-house. Appended to it is a huge disk of dry and hardened brownish wax, on one side of which are stamped the royal arms of England, and on the other a full-length effigy of "Anne, by the grace of God Queen," etc., receiving the homage of two kneeling Indians, who offer a beaver-skin and a roll of wampum. This Great Seal of the Province is a curious and valuable trophy.

In the time of John, "third lord" (actually the second), a memorable incident befell the manor, in the form of a visit from Captain Kidd. The absurdities that have been committed in digging for Kidd's "buried treasure" have, I am aware, brought his name into a still greater disrepute than it suffered while he was alive; the crowning obloquy of all is, that many suspect the bold pirate of having never existed. But if he was a myth, the English State Trials are also a myth; and if Kidd had known that he was to be made the victim of such doubts, he would, I am sure, have delayed the ceremony of being hanged in chains at Execution Dock until he could have prepared satisfactory proofs of his reality. In the last part of the seventeenth century people had not critical sagacity enough to question his existence, after they had caught him. But they knew a pirate when they saw him, and used to spell the word with a capital P.

The injury to honest commerce from these marauders was so great that in 1695 the King, Lord Chancellor Somers, the Duke of Shrewsbury, the Earl of Bellomont, and others joined in fitting out a ship to cruise against pirates, under royal commission; the King reserving one-tenth of the profits that should result, while the other contributors of rank were to share according to their investment in the enterprise. Captain William Kidd, then a skillful merchant captain sailing between London and New York, was chosen as commander, on the recommendation of Colonel Richard Livingston, of the latter town. For a while he cruised on the American coast, in the *Adventure* galley, and was considered so useful that the New York Assembly voted him a present of two hundred and fifty pounds. Soon after this he sailed for the East Indies, and there came to the conclusion that he would do a

little buccaneering on his own account. Capturing a rich Moorish vessel, he transferred his forces to her and burned the *Adventure* galley; and thus he went on, moving his quarters whenever he met a ship that struck her colors and his fancy at the same time; collecting enormous booty; roaming from the East Indies to the West; picking up prizes on the African coast; making his headquarters at Madagascar much of the time. The inducements to this line of conduct may be guessed when the fact is recalled that part of the goods sold from the ship *Queda*, taken off Africa, is said to have yielded him forty thousand pounds.* Complaints of his depredations were made in Parliament, and an exciting debate ensued, in which the Lord Chancellor and the titled projectors of Kidd's expedition were accused of sharing in the proceeds of piracy. Some suspicion, I believe, fell even upon the King. At last the situation became so grave that the King was obliged to offer a reward for Kidd's arrest, and with this he coupled free pardon to all pirates who should surrender before April 30, 1699.

Meanwhile the Earl of Bellomont, who was one of the company that fitted out Kidd, had been appointed Governor of New York, and afterwards of Massachusetts (holding both offices at once), and was making a stir over the pirate question in the colonies. The English State Papers disclose that he wrote to the home government with great show of testy vigor, in July, 1699, complaining that Long Island was a "Receptacle of Pirates." "The Pirates," he says, "are so cherished by the inhabitants that not a man of them is taken up." There is need of an honest judge and one or two active prosecuting attorneys; so this righteous, indignant governor declares. In one letter he sets forth the colossal profit to the citizens from traffic with the pirates. "'Tis the most beneficial trade that ever was heard of." Merchants, it seems, can buy rum at two shillings a gallon in New York, and sell it at the piratical rendezvous in Madagascar for fifty shillings (twenty-four hundred per cent. advance in price)! A pipe of Madeira wine, nineteen pounds in New York — three hundred pounds in Madagascar. "Beneficial" trade, indeed! On the other hand, it is very pleasant to have the pirates send stolen goods to New York, which can be resold at a delectably high figure to the confiding consumer. While Bellomont is visiting the infant metropolis, eight or nine pirate ships (if we are to believe his dispatches) enter the harbor, and, but for his presence, would have landed one hundred thousand pounds in gold and silver, besides

* The State Trials give the value at only £4500, with £400 more for the vessel itself.

quantities of goods; the impossibility of doing which, while the Governor is on hand, puts the local merchants very much out of sorts. Tell-tale "Arabian gold," also, is very plentiful in New York. Briefly, the impression left by these reports is, that the New York provincials, though in principle opposed to piracy, did not deny themselves any advantages that might be had while the system lasted. We have seen something similar in the pirating of books within the present century; otherwise we might refuse to believe that New Yorkers had ever been so naughty.

But is it not rather strange that the Earl of Bellomont, who could exert so much epistolary vigor against the pirates, was unable to bring a solitary offender to punishment, even when eight or nine came into the harbor under his official nose? Remember that Bellomont was one of the company owning the cruiser; bear in mind, also, the startling charges made in Parliament against the members of that company. An appearance of anti-piratical zeal on the Governor's part, even though unattended by active measures, would certainly be a good means of distracting attention from possible dividends that would not bear scrutiny. But now we come to a still stranger circumstance.

November 23d, 1698,—only a few days after Bellomont's letter concerning New York,—the King issued his proclamation against Kidd. Seven months later, viz., at the end of the next June, Kidd—who was in constant communication with other vessels, and must have known all about the proclamation—calmly made his appearance in Gardiner's Bay, *en route* for Boston.

Lord John, one June evening, observed a mysterious sloop with six guns riding at anchor off the island. It was Kidd's last vessel, the *Antonio*. This Lord John was a large, hearty man, who lived generously, was "clever" to the Indians and squaws, and had so much ability in affairs that, although he married four times and spent a great deal of money, he portioned off his daughters handsomely and left a large estate at his death. He was not a person to be scared by a mysterious armed sloop; so, after she had lain in sight two days without making any sign, he put off in a boat, to board her and inquire what she was. As he came up over the side, Captain Kidd—till then unknown to him—received him with the traditional politeness of a thriving desperado, and asked after the health of himself and family. Then, in answer to Lord John's inquiries, he said that he was on his way to Lord Bellomont at Boston: would Gardiner do him the favor to carry two negro boys and one negro girl ashore, to

be kept there until he returned or sent an order for them? Gardiner consented, and went back to the island. The next morning Kidd resumed intercourse by sending ashore a request that Gardiner should come on board at once, and bring six sheep with him. This was rather forcing the acquaintance, Gardiner may have thought; but he complied. Thereupon Kidd promptly ripened acquaintance into intimacy, and asked him if he could spare a barrel of cider. Lord John once more proved neighborly, and found that he *could* spare the cider, sending two of his men ashore to fetch it. While waiting for their return, Kidd got out from his cargo two "pieces" of damaged Bengal muslin,—a rare and valued fabric in its pristine state,—which he put into a bag and requested Gardiner to take as a present to his wife. It is likely enough that the captain, seeing in hearty Lord John a capacity for such things, produced some of his fifty-shilling rum, or three-hundred-pound Madeira to be tasted. Something, at any rate, warmed him up to increased generosity, for "in about a quarter of an hour" he presented the Lord of the Isle with some muslin for his own use. When the men came back with the barrel of cider, he gave them four pieces of gold for their trouble. Furthermore, after getting ready to sail, he offered to pay for the cider; but Gardiner protested that he was sufficiently rewarded by the present to his wife. They parted at last; and Kidd, gallantly firing a salute of four guns, stood for Block Island.

His purpose in lingering in these waters was to get rid of his suspicious freight before going to Boston. During his stay near the island two New York sloops took off part of his cargo; and three days later he returned from Block Island in company with another nefarious sloop, which relieved him of chests containing plate and gold and other goods. This time Kidd again sent for Gardiner and committed to his charge a chest, a box of gold, a bundle of quilts, and four bales of goods. The box of gold, as Gardiner, afterwards solemnly deposed, was destined by Kidd for Lord Bellomont. All the treasure and merchandise was buried in some swampy land near Cherry Harbor, beside Home Pond, within a mile of the manor-house, to be kept for Kidd or his order.

"If I call for it and it is gone," Kidd declared to Lord John, "I will take your head or your son's."

Nevertheless, he sweetened this warning with a present of a bag of sugar before he went. It was probably at this time that the bold corsair made known to Mrs. Gardiner that a small roasted pig would be acceptable. The

FRAGMENT OF A PIECE OF CLOTH-OF-GOLD PRESENTED BY CAPTAIN KIDD TO THE WIFE OF JOHN GARDINER.

frightened lady supervised the cooking of the animal with great care; and the conjunction of roast pig with live Kidd seems to have been auspicious, for the captain returned Mrs. Gardiner's favor with a blanket of cloth-of-gold, long retained by her descendants as an heirloom. It was a rich fabric of silk completely interwoven with gold thread in a very graceful pattern; and, although it has unfortunately been cut up and distributed bit by bit to successive sons and daughters, so that only two small pieces are now known to remain, one of the fragments is still kept at the manor.

It is clear from Kidd's behavior that he counted on absolute immunity, under Bellomont's protection; but things had grown "too hot" for the Governor, and when the pirate chief got to Boston he was arrested and imprisoned; whence he was sent to London, tried in 1701 for piracy and the murder of one of his men, and executed. Bellomont, securing his memoranda of deposits in various places, sent out a demand for their surrender; among others, to Gardiner, who made haste to dig up the chests and bales, and carry them to Boston. The receipt given him by the Governor's committee, dated July 7, 1699, now in the possession of the twelfth proprietor and by him shown to the present writer, specifies: three bags of "dust-gold," one of coined gold, one of silver coin; a bag of silver rings and precious stones, and one of unpolished gems; a piece of crystal, some carnelian rings, two agates, two amethysts; also, bags containing silver buttons and lamps, broken silver, gold bars and silver bars, sixty-nine precious stones "by tale." Their value was set at £4500. A large amount of stuff was likewise found in a house in New York; and Bellomont estimated that the recovered booty would foot up altogether about £14,000.

There can be no doubt as to the solid worth of "Kidd's treasure"; but the obstacle to its availability to-day is that his hiding-places were all known at the time; and if any of the buried valuables escaped the govern-

ment's confiscation, they were dug up by Kidd's accomplices or enforced trustees, and disposed of, one hundred and eighty-five years ago.

The only profit that Lord John Gardiner made out of this episode was accidental. On coming home from Boston, he unpacked his portmanteau in which some of the smaller packages had been stowed; and as he did so there rolled out upon the floor, to his horrified gaze, one guilty diamond that had got astray from the "precious stones by tale." He would have sent it after the rest, but his wife interposed; she thought he had been at pains enough, and on her own responsibility kept the diamond. Yet even this slight guerdon slipped away, after the manner of all magic or underhand wealth. Mrs. Gardiner gave it to her daughter; and the "large, hearty" John at that time kept a chaplain — one Thomas Green, of Boston — in whom his daughter became interested. Lord John kept the chaplain; the chaplain ran away with and married the daughter; and the daughter kept the diamond. From that little complication of affairs sprang the famous Gardiner-Greens of Boston. The first Gardiner-Green married a daughter of the artist Copley, sister of Baron Lyndhurst, Lord Chancellor of England. There are other family connections of the Gardiners which have historic interest. A son of one of the proprietors married the daughter of Sir Richard Saltonstall. A daughter of the Gardiners was the great-grandmother of George Bancroft; and the widow of John, fifth lord (who had been Deborah Lathrop), married General Israel Putnam, and died at his headquarters in the Hudson Highlands during the Revolution. It should be said here, too, that Mary, the daughter of Lion, married Jeremiah Conkling of East Hampton, the ancestor of Roscoe Conkling. She was "called old Grané Conkling, and was a famous woman in those times and very useful." In 1844 Miss Juliana Gardiner became the second wife of President Tyler. Another connection of some interest, though not one

of relationship, may be found in the fact that the first law-partner of ex-President Arthur was a Gardiner, descended from the valiant Lion.

The third lord, so considerably treated by Kidd, was a good deal pestered by pirates, and did not always fare well at their hands. Twice he was invaded by them and had his house ransacked; family plate and cattle were carried off, beds were ripped open for the money ingenuously concealed in them; and once the proprietor himself was severely cut with swords, and tied to a mulberry-tree while the maraud went on. During the minority of the seventh proprietor, John Lyon Gardiner, the British in 1775 plundered the place of seventy cattle and twelve hundred sheep for General Gage at Boston; the rest of the stock was seized by the patriot committee and paid for in Continental money; the timber was much injured; and the officers of the British fleet, which lay for some time in Bostwick's Bay

(1780-81), amused themselves by gunning in the manor-woods or resorting to the house, where on rainy days they pitched dollars on the dining-room floor. The marks of this diversion are still visible. At the end of the war the island had been stripped so bare of immediate valuables that there was hardly personal property enough to pay arrears of taxes. The seventh proprietor, however,—now plain Mr. Gardiner and well satisfied with that appellation, since the Gardiners were all staunch patriots,—held the estate together and restored its prosperity. He was, in addition, a man of scholarly and antiquarian taste; compiled a list of Long Island Indian words; and had a literary judgment so sound that Lyman Beecher, during his East Hampton pastorate, never would print a sermon until it had been submitted to Mr. Gardiner for his opinion.

The later annals of the island have been quiet and peaceful. The only armament of war which it ever possessed was a single can-

ESCUTCHEON AND FIREPLACE IN THE MANOR-HOUSE.

ON THE COMMON.

non, posted there by the Continental authorities, to give warning of the British fleet's approach. It now lies rusty and fractured on the grassy commons, near the sheep-fold. For a long time the owners carried on whaling in the vicinity; their Indian tenants being especially expert in that marine branch of hunting; while the squaws were thought to have a special knack in cultivating maize. But in later decades the industry of the place has been confined to farming, sheep-raising, and stock-breeding; the sea being resorted to only for such fish, clams, or lobsters as may supply the daily manorial needs. Except for tea, coffee, sugar, spices, wine, and manufactured articles, the territory is absolutely self-sustaining. There is no church and no antipodal rum repository within its borders.* Notwithstanding the power conferred on the pre-revolutionary owners, they never made any laws, but governed the place in a patriarchal way by the canons of good sense, good will, and friendly understanding, as their successor does to-day. There is not even a watchdog on the place. Yet the records of the island do not include a single crime or serious misdemeanor among the tenants. The little community is diligent, orderly, contented, happy. Even turbulent characters, who now and then drift thither among the hired summer-laborers, promptly grow calm under the peculiar and mild influence of the sweet landscape, the soft ocean air, and the ancestral quietude and dignity that invest the daily routine of this bucolic retreat.

It used to be the custom, in going thither from East Hampton, to signal from the Long Island beach directly opposite the manor-house. This was done by building a large fire of seaweed on the sand, the smoke of which

being seen across the three-mile channel, a skiff would be sent over for the visitors. It was this custom which originated the name of Fireplace. But my artist friend and I took a cat-boat from Greenport, when on a breezy afternoon of July we revisited the spot together. After the chafe and whirr, the sordid toil and fallacious glitter of a city hibernation, how idyllic it seemed! White clouds hung poised above the meek line of land, like the outstretched wings of some spirit of perpetual rest brooding over the wave-embosomed island. The soft, weird cry of the fish-hawks rang faintly out of the upper air, as before. The old manor-house, wise with a thousand unspoken memories and associations, still peered out from its cozy nook; and the bob-white whistled without fear in front of the very door, while blackbirds, robins, English sparrows, and the shy brown-thrasher flitted to and fro and chirped in happy unison, among the cherries and around the box-hedges of the tangled garden. We roamed through the wainscoted rooms and hallways of the well-proportioned house, and gazed at the framed escutcheon over the old fireplace in the parlor,—a marvel of exquisite embroidery in floss-silk, wrought by a daughter of the fourth lord, whose education was said to have cost

* The wife of the present proprietor maintains a Sunday-school for the island children.

GARDINER'S POINT.

more than the value of the cattle on the island. This escutcheon consists of a chevron between three bugle-horns, with a helmet above, and for crest an arm in armor holding a broken lance. The latter emblem betokens a warrior of great power, famous for disarming opponents. Underneath the insignia is the motto: "By the name of Gardiner." The arms are identical with those formerly borne by Thomas Gardiner, prior of the monastery of Tynemouth, England; but it has never been definitely ascertained from what family in England the Gardiners of Gardiner's Island came. When we returned from our wanderings hither and thither about the estate, the old portraits, the antique wainscots, the quaint engravings on the walls, drew us silently from

the present back to the past; and amid the varied conversation at the table there was always present on plate or glass that mailed arm grimly holding the broken lance; so that gradually we came to feel that we were ensconced in some placid feudal stronghold of the past.

Severed from newspapers, the mail, and the telegraph, we gave ourselves up to the delicious atmosphere of the place, and to the illusion of remoteness which it created. We rode over the breezy downs, where like shades of velvet the grass changes from dun to green or yellow, or to violet bloom, under wind and sun and cloud; where also a drove of a thousand old-gold sheep may sometimes be seen massing themselves on a blowy upland against a sky

of purple storm. Again we wandered afoot in the luscious woods, through which herds of wild deer, held sacred from the rifle, live free and unconcerned on companionable terms with humanity. Huge vines run upward and downward from the ground to the branches, suggesting tropical scenes. The intoxicating scent of wild-grape blossoms, that cluster in masses everywhere, streams through the leafy labyrinth; and the song-sparrows' roundelay mingles with the high, questioning note of the fish-hawks that build and haunt their ragged nests at will on the tops of moss-mantled cedars, hemlocks, oaks, or twisted pepperidge-trees. Blue herons often come to the Tobacco Lot Pond, and sometimes the white crane appears there.

And the curious names of localities! We find Hoop-pole Thicket, Whale Cliff, Eastern Plain, Stepping Stones, Marvel Mount Rock, Old Barn Field, and Tobacco Lot (where no tobacco has grown within the memory of white men). These are all shown on an old surveyor's map of 1722, which hangs in the upper hall of the manor and has been much nibbled by mice, who have apparently tried thus to exemplify the encroachments of the sea. The water gains upon Gardiner's Island at the rate of ten feet a year on the bay side, and much more on the lofty ocean shore. But as a computation shows that, at this rate, the tide will require one hundred and thirteen years to reach the manor-house, the present owner need not be anxious. Even then the center of the domain will be untouched. And there, on the open, rising ground, lies the lonely and solemn grave-yard of the Gardiners. A granite boulder—the only one on the island—forms a natural monument, around which the memorial stones are grouped; and when you stand there, compassing nearly the whole island in your view, with oblivious waters on every side, you feel that if this unique domain was the "place where many have died," it is

also the place where many have lived and may yet live.

It was a hard thing to forsake the baronial hospitality which, for the time being, had made us nearly as much at home on the island as its long line of proprietors have been. When our feet touched the soil of Greenport; when we heard the steam-cars again, and were infested by newspapers as by a swarm of mosquitoes; when we suddenly rediscovered the existence of dust, finding ourselves stifled by the hopeless, dowdy ugliness of an American village business street, the lordship and manor seemed as distant and desirable as if it had been three thousand miles away, instead of twelve. So unlike was it to everything else hereabouts, that I should have doubted its existence had I known of it only from hearsay. But had not my eyes beheld the Geneva Bible, the rare presentation copy of Eliot's Indian Bible, the old patents, and the inherited wampum belt? And these fingers had touched Kidd's cloth-of-gold! Moreover, I had slept in the haunted chamber, and been thrilled by odd apprehensions even before I knew it was haunted. Strange things could we tell—my friend and I—about mysterious noises, peculiar sparkles of light, and an uncanny ring of green flame revolving on the fireless hearth at midnight. But as our host did not divulge the ghost story, and I have found this untold tale as impressive as any I ever heard, I shall not further detail our experience. 'Tis enough that I know Lion Gardiner's legacy to be what I have described it, and more: a sea island quite unspoiled by time or pseudo-progress, yet the seat of a luxurious and independent home; a lovely solitude never defiled by a hotel; a little principality, where a good citizen rules without pomp and pays taxes on the mainland; a small country in itself, which no Caucasian ever called his own unless he was called "by the name of Gardiner."

George Parsons Lathrop.

THE POET.

HE walks with God upon the hills!
 And sees, each morn, the world arise
 New-bathed in light of paradise.
 He hears the laughter of her rills,
 Her melodies of many voices,
 And greets her while his heart rejoices.
 She to his spirit undefiled,
 Makes answer as a little child;
 Unveiled before his eyes she stands,
 And gives her secrets to his hands.

Ina D. Coolbrith.

JOHN BODEWIN'S TESTIMONY.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "Friend Barton's Concern," etc.

V.—(Continued.)

"ISN'T she charming?" Mrs. Craig said to Bodewin. The trees parting had allowed him to keep at her side. "So extravagantly pretty and yet so simple and womanly! Don't you think so?"

"I have not tried my epithets on her yet," Bodewin replied. "But I dare say I could find fault with yours. I should not call her extravagantly pretty, and I doubt if it would be safe to rely on her simplicity."

"Oh, I don't mean that kind of simplicity! She is simple like an antique, like a young goddess."

"Which one do you mean?" he said. "There is the Goddess of Liberty on the Capitol. Do you call her simple?"

"No, I call her decidedly ornate. There is a word which just describes her if I could only think of it."

"Do you mean the Goddess of Liberty? You bewilder me so with your transitions."

"No, I mean my goddess."

"Perhaps western is the word you want."

"Western? Well, it isn't such a bad word if you take it right."

"I mean it right."

"Somehow I cannot talk to you this morning, Mr. Bodewin. I think you are not in your happiest vein. Are you?"

"I have no happy veins, Mrs. Craig. They all 'pinched out' years ago."

"Sink a new shaft then and prospect for more. Isn't that good advice?"

"If one had any new ground to sink on. The really virtuous thing to do would be to overhaul the old dumps and try to make day's wages out of them."

"You'll never be so proper as that! The American does not live who is content with day's wages merely at anything."

"It is time he was born then," said Bodewin.

"Don't be so dismal! It is uncomplimentary, and it isn't patriotic. When you see a girl like that from Kansas City, doesn't it make you feel how rich the country must be in girls?"

Bodewin laughed. "If it be not rich for me—" and then the trees crowding them apart, he lifted his hat and dropped behind.

When next they met, Mrs. Craig took up the burden briskly, the thread being still the same.

"She's not a Kansas City girl, you know."

"No?"

"No, she is not a Missourian. It would be strange if she were, even in name. Her family—that is, her mother's family—have no cause to love Missourians. Her mother's father was shot dead—on his own doorstep, if you please—by a mob of Missourians during the border troubles."

"An unpleasant little incident in the family history, I should say."

"Unpleasant! Ah, it must take a good many generations for a shock like that to die out of the blood! And there was trouble enough and to spare before it came to the shooting,—journeys and hardships and struggles and excitements. You don't ask what what his offense was!"

"I suppose his offense was that he was a Free-State settler."

"—A brave and consistent one; yes. He was one of that band of families who were turned back by the cannon planted on the Missouri River to prevent the steamboats from landing Free-State men. They went north by way of Iowa and Nebraska (a cheerful little journey), and when they reached the border again, they were met by government soldiers and deprived of their arms as if they had been a band of convicts. No one, it seems, ever thought of disarming the Missourians. The grandfather Fletcher, Joseph Fletcher,—hence Josephine,—had signed a protest against the shameless election frauds. They came to his house one night and demanded to search the premises for incendiary books and papers. The New York 'Tribune' would have been incendiary, I suppose, in those days, or Whittier's poems. He refused to let them in. He told them his wife was very ill——"

"Was she?"

"Of course she was,—so ill that she died soon afterwards. They accused him of signing the protest. He did not deny it, and they then politely informed him that they would not disturb his wife that night, but would trouble him to go with them. They were going to tar and feather him, or do something hideous to him."

"How did he know that?"

"I suppose they told him. At all events he refused to go with them. Wouldn't you have refused?"

"Possibly I should."

"You know you would—any man would! They tried to compel him; he resisted, and they shot him. The family were desired not to pollute the territory with their presence any longer. Their friends the Missourians escorted them to the border,—the wife, two grown sons, and Miss Josephine's mother, then a girl of sixteen. At some little town in Ohio they buried their mother. The sons remained there, and are now wealthy men in Cleveland. The daughter married Mr. Newbold. I cannot imagine how he ever persuaded her to go back with him to Kansas, but he did after the sacking and shooting were over. Josephine was born at Wyandot. She is just as old as the Free-State Constitution."

"Did Miss Newbold tell you this story, Mrs. Craig?"

"No; oh, no! That would not be like her, I am sure. Mr. Newbold told it to Mr. Craig one day when they were alone together in the office. He was speaking of his wife's delicate health, and the trial it was for Josephine to leave her. But Mrs. Newbold, it seems, has a perfect horror of the frontier; I should think she would have. When she found her husband bent on this trip, she insisted Josephine should bear him company; to take care of him, I suppose, if he should be ill. He spoke very nicely about his wife, Mr. Craig said; but I dare say he couldn't help being a little complacent over her anxiety about himself. Miss Newbold has never mentioned her mother to me but once. She told me that her mother was born among the mountains, that she had never seen them since her childhood, and often dreamed of them with a homesick longing; that she wanted her, Josephine, to see them and be among them while she was still a girl. I think that is so natural, and of course she would not say it to her husband."

"Wouldn't she? Why not?"

"Could she talk about her dreams of the old home in the East she never expected to see again, to a man like Mr. Newbold?"

"She perhaps does not take the same view of Mr. Newbold that you do. At all events, she was willing at one time to exchange those dreams for a reality which must have been something like him."

"Ah! that was the husband of her youth. Does he look like the husband of anybody's youth? He has deteriorated. He has let himself down, you may be sure of that. He has that sleek, prosperous blood in him."

"You think there are no martyrs on Mr. Newbold's side?"

"I should say, judging from papa Newbold, that as a family they would be distinguished by good digestions and a tendency to conform whenever opposition was likely to make things uncomfortable. However, I can't be just to him. I gave him such a horrible little dinner, and we never can forgive the people we have irretrievably wronged."

VI.

JOSEPHINE'S QUESTION.

THEY had now left the heavy timber behind them. The firs grew more sparsely. They were low and crooked; occasionally the weather-worn trunk of a dead tree leaned in spectral whiteness against the dark ranks of its survivors. The riders were close upon the line where trees cease and vegetation takes a fur-like habit. Against the deep, cloudless blue of the upper atmosphere rose the brown and naked peaks, streaked with supernal snows. The sun glowed hot upon them; motionless shadows defined every angle and chasm. Clear, solid masses of shadow swept down the sheer slopes into the cañon. They were now twelve thousand feet above the level of the sea, crossing a shoulder of the mountain, from which they looked down into deep below deep of shadow and light, descending to the map-like picture of river-laced valley and high, barren plain, mesa, and mountain, range beyond range, brown and purple and blue, departing towards the infinite distance. The horses panted, their ears drooped, their hoofs rattled on the rocky planes up which they clambered. There was no soil and no verdure except a dry, iron-stained lichen which covered the uncumbled surface of rock with its rough scales.

Mr. Hillbury was in search of a prospect-hole, described as the highest one within a day's ride of the camp, where certain fossil records of the "Old Silurian" had lately come to light. By the measured clink of steel upon steel, they were evidently not far from some form of human labor. Following the trend of the mountain, they came upon two men standing face to face on a limestone ledge, at work upon it with hammer and drill. Fragments of broken rock and materials for blasting were scattered about. There was no shelter or sign of habitation near them. Josephine, looking back to speak to Mrs. Craig, saw that she had dismounted some distance below, and was seated on the sloping, rocky floor, while her husband readjusted her saddle-blanket. Pres-

ently he sat down beside her, leaving the horses fastened together by their bridles.

"Aren't they coming?" Josephine asked Mr. Hillbury.

"Oh, Craig!" he called; "are you coming up?"

"No," was the reply. "Take your time; we're all right."

They looked as if they were. Mrs. Craig, waving an *au revoir* to Josephine, stretched herself out flat upon the rock. Mr. Craig doubled his legs under him and lit a cigarette. Josephine looked rather wistfully at this comfortable pantomime.

"Aren't you tired yourself?" Bodewin asked.

"A little," she admitted. "How far is it to the lake?"

"Half an hour's climb down again. Let me take you off. It's a pity to get too tired on your first climb."

She let herself be lifted down. Bodewin hung her bridle over the pommel of his own saddle, and took his place beside her on the sun-warmed rock. Mr. Hillbury was already fossil-hunting, tapping about with his scientific hammer, while the dead home-strokes of the miner's sledge beat continuously on the silence. For the sake of a brief respite from the sound, Bodewin addressed one of the miners; stretching himself forward on an elbow to examine a hole they had prepared for blasting, he asked:

"Can you get enough powder in a hole of this size for such hard rock?"

"Eh?" The man who was striking the drill stopped, and the big sunburnt Irishman who held it replied:

"That's what I'm tellin' him," indicating his partner. "It's losin' our labor we are! Ye'll blaw and blaw and ye'll not get the fill o' yer hat! Them drills is too short. What's *he* afther?" he asked, leaning upon his drill, and nodding his head with a confidential smile towards Mr. Hillbury.

"Prospecting for fossils," Bodewin replied.

"Is it one o' thim stawne bot'nists he is?"

Bodewin nodded. "Something like that."

"Sure, this is the place for 'im. There's plenty of it here."

He came down the ledge towards them, using his tool as a staff, and ringing it on the rock with each heavy, limping step. His partner remained above sitting on the heels of his boots, his elbows on his knees, his hands dropped between them holding his idle hammer. He was a slenderly built youth of about twenty, beardless, tanned to the color of a Mexican, with thin, rather handsome features, and a dull, passionate expression. He watched Josephine and Bodewin with listless attentiveness.

"What have you got here?" Bodewin inquired of the man with the drill, picking up some pieces of rock as he spoke.

"Well-le, there's galeny in it, and there's carbónnets," he replied, turning over the fragments of stone with his big, freckled, hairy hand. His manner lacked the enthusiasm of the typical miner, but he spoke with a degree of respect for his own prospects.

"Where are your carbonates?" Bodewin asked.

"And what d'ye call thim?" exhibiting a piece of rock of the color of an over-burnt brick.

"There are no carbonates here." Bodewin spoke with reckless candor. "That reddish stuff is the oxide of iron."

"To the divvle wid yer ox-ides! I'll lay me ould hat that's the color we're lookin' for. Is it'n assayer ye are?"

"Take it over to the stone botanist and see what he makes of it," said Bodewin lazily.

"No, but is it an assay —"

"Take it to the botanist! He'll assay it for you."

"He is *lame*!" Josephine said, looking after him as he limped away over the rocks with his specimen in one hand and his drill in the other.

"Oh no, he isn't; it's the national walk. Don't you see he is lame in both feet?"

"Weren't you rather cruel to him about his 'carbónnets'?"

"Not half as cruel as I am to Hillbury," Bodewin replied, laughing. "Hillbury would keep us here till night if something were not sent to irritate him." Seeing that she still looked sorrowfully after the unlucky prospector, he added, "Would it be cruel to tell the camel he couldn't get through the needle's eye?"

"Is it as hopeless as that? Poor fellow! he will lose his labor, as he said."

"He will do well if he loses no more than his labor. They are a queer pair. What fate do you suppose sent a good-natured Irish bricklayer up here nearly to the top of Sheridan, silver hunting, with a Canadian half-breed, I should think by the looks of him," glancing upward toward the slim dark figure on the rocks above, "for a partner?"

"Where do you suppose they live?"

"They have a bough shanty, probably, in the nearest timber. Micky, I dare say, has a wife down in the camp, taking in washing to feed the kids, while he plays it alone up here for higher stakes."

Bodewin lay stretched out upon the rock in one of his camp-fire attitudes. Josephine, sitting a little above him, could see only the narrowing lines of the lower part of his face below his hat-brim. They were sensitive lines,

and looked capable of much refinement of expression, but they rested habitually in a quietness that was like a mask. Dizzily and dreamily Josephine looked about her. She felt rather than saw how far they were exalted into that vast dome of light, what a little ledge of the world they rested on. The sun that beat upon the rock filled her veins with its potent warmth. It was like an exquisitely gentle and prolonged stream of electricity, suffusing the brain and penetrating the very tissues of the bones. It was intoxicating. Dark spots crossed her vision. She drew a long sigh of retarded breath and closed her eyes. Then she heard Bodewin speaking.

"Miss Newbold, I think after all you must let me answer that question."

Josephine waited a moment before replying. She felt it would be paltry to ask what question. She merely said:

"Please let it be as if I had not asked it."

"How is that to be done?" Bodewin asked, moving a little so he could look up at her as she sat above him.

"May not one repent of a hasty speech and withdraw it?"

"If there be any occasion for repentance. But it is not easy to forget words sincerely spoken. I think your question was a sincere one, Miss Newbold."

"What would it be if it were not that?" Josephine asked.

"It would not be worth remembering. But I have remembered it, you see, in spite of myself, I may say. I believe I agreed with you when you said you had no right to ask it. That was a hasty admission on my part."

"Not at all! You could not help seeing it was a blunder. I hoped you would have seen how sorry I was, and have had the grace to forget it."

Bodewin, feeling about among the loose fragments of rock under his hand, chose one and skipped it downward, watching it glinting along on its precipitous course until it vanished in the purple depth of shadow below them.

"Grant that it was a blunder," he resumed. "I think you do not often blunder in that way. There must have been some force of feeling behind the speech that you so deprecate. It could hardly have come from your lips merely." He looked at her and smiled. "We are in for it now, you see."

She did not return the smile. "I don't know what you mean by 'in for it.' There is no question. I have withdrawn it. It doesn't exist."

"You have a very lofty little way of annihilating the past; unfortunately, it doesn't affect my past. The question still exists for me. It

has been existing steadily and waxing troublesome ever since I saw you."

"Oh!" said Josephine, with a sigh of impatience.

"Well, then, why did you ask it, Miss Newbold? You charged me the other evening with being a renegade to justice. Is it not so?"

Josephine opened her lips to protest, but saw the hopelessness of it, apparently, and preserved her silence of sufferance. Bodewin smiled again quietly:

"It is not often a woman is called to plead for justice in opposition to sentiment—for my answer to your question must be in the name of something I shall have to call sentiment for want of a better word. You see what an unusual opportunity you are giving me. It should be made a precedent,—if only I were worthy of my rôle." He jerked another pebble from his fingers into the abyss, and again he looked with a half-fascinated, half-teasing smile into the girl's troubled face.

"When will you hear my poor defense? There is not time to offer it now; besides, I should like to get up my case a little before presenting it."

Josephine would not speak. She felt how hot and flushed her cheeks were, and how her lips trembled in spite of herself.

"You will not be cruel enough to go away and leave the ghost of that unanswered question to haunt me. I shall hear you all the way from Kansas City, saying, 'If you care for justice, why won't you ——'"

"Will you please not repeat my words?" she interrupted, haughtily.

There was not a trace of mockery in his voice when he spoke again.

"They are not your words. You have parted with them; they have a life of their own now. Not if you live a thousand years will you ever get them back again."

She turned her full face towards him with a speechless, startled movement.

"You cannot separate a vital question from its answer," he continued. "You know that every now and then in the life of a nation or of a man the time comes for somebody to ask a question. The person who asks it may not wish to be the one chosen; but once the word is out it cannot rest until it gets itself answered, if it is a real question, if it takes the nation's life, or the man's, to answer it. I have not deliberately thought about your question, Miss Newbold, but it is no exaggeration to say that since I saw you last I have thought of but little else. If I cannot answer it to your satisfaction, you may summon me to the trial as your witness."

"Answer it to yourself," she said, "and if truth and justice do not summon you, you have no right to be there."

"There are other obligations besides those which truth and justice lay upon us."

"But I think those must come first."

"Now you touch upon the reason why I wish to place my little problem before you. I had decided in favor of certain other obligations; I dare say I have become morbid about them. Because of your untroubled preference for truth and justice, and because you are a stranger, unbiased, as a wise young judge should be, I desire to set my small difficulty before you. I am tired of it. My conscience, when I question it, gives out only indistinct mutterings."

"You ask far too much of me. I cannot do this for you, Mr. Bodewin. I am not untroubled. I am not unbiased. I was thinking of my father; when I spoke to you I feared you might be refusing to testify because you knew of some reason, unknown to him or to Mr. Craig, why he ought not to win his suit. It was, of course, my own misgiving entirely. I have never mentioned it to any one, but it seemed to me a terrible thing that you should be willing to stand aside and see an honest man commit an unintentional fraud."

"But I told you I believed your father's side was the right side, did I not?"

"Yes, and I was satisfied."

"Then, once more, please, why did you ask me that question?"

"Why did I — what?" said Josephine confusedly.

"It was after I gave you, unconsciously enough, that satisfaction you speak of, that you said,—well, you will not let me repeat the words. Was there not another misgiving? Has that been satisfied?"

"No," said Josephine helplessly, "but it does not concern — me."

"Whom does it concern, may I ask?"

"I am not so anxious to answer questions as you are."

"Does it concern *me*, Miss Newbold? I seem to be flattering myself, but there are not so many parties in this affair. I can hardly suppose it is Mr. Harkins you —"

"I know I have brought this on myself," cried Josephine in desperate annoyance, "but don't you think it has gone far enough now?"

"As soon as you have promised to give me an opportunity to reply to whatever doubt prompted your question, it will have gone far enough — not till then."

"I have said that it does not concern me, and have asked your pardon for letting you know I had the doubt, or for having it, if you like. Can I do more?"

"You have not said that your suspicions do not concern *me*."

"Suspensions!"

"We will go back to the original word then — your question. Say that your question did not concern me, and I will not insist upon answering it."

Josephine was silent.

"You have called me to account for a course of action I am at perfect liberty to take and which no man has yet questioned. Is it quite just for you to refuse to hear my defense, such as it is? I don't claim it is sufficient."

"I will hear it."

"When, please?"

"Whenever you like. But I cannot attempt to influence your decision. I would not do it if you were my own brother."

"It would be much less easy for you to, if I were. Does it seem to you too intimate a thing for me to ask of you?"

"Yes, it does!" she exclaimed eagerly, — "precisely that!"

"I don't regard it so, and I promise you I will not take advantage of it as an approach to anything of the sort in the future. For that matter, our acquaintance has no future any more than it has a past. It shares the spirit of this place, where we all live and live fast in the present, and then separate and know each other no more. I should like to believe that some instinct of helpfulness in you prompted those words which you regret, because they were unconventional. Don't regret them. Don't take back your words, but be true to them, and be brave enough not to shirk the sequel to them. The sequel to a question is its answer."

Josephine was far more startled by his earnestness than she had been chagrined by his badinage.

"Oh!" she cried in desperation, "why will you insist upon enforcing the sequel to such a foolish beginning? Why not let it rest? What is it but a trifle — a few poor words?"

"It is not a trifle to me, coming from you, if you please. It amounts to an accusation. It cannot be withdrawn to my satisfaction until it has been answered."

"I will listen to your answer, but more than that I insist you must not ask of me. I am not an expert on matters of the conscience — and I am being slowly consumed on this rock," she sighed.

"Forgive me!" he said, springing to his feet and holding out a hand to help her to rise. "I did not know I was assisting at an *auto da fé*. Have I made you hate me?"

"Yes!" she declared. "Do not put your problem in my hands. I am as biased as the

most disagreeable half-hour I ever spent in my life can make me!"

"I am sorry you should be indebted to me for it."

"Oh, I am not! I am indebted to myself, But I shall hate you for it, just the same."

"I have no doubt of it. I ought to be proud to suffer vicariously when I can save you from yourself by doing so. You must be very severe with yourself when you are fairly roused."

"I think I have never been fairly roused."

"If you will pardon my putting myself in the same category with yourself, I think we neither of us have," he said.

"It must be a horrible experience to be utterly and fundamentally hateful to one's self."

"I think it is an experience that comes to but few, and not to the greatest transgressors perhaps. Here comes Hillbury! He seems to have torn himself from the bosom of the Old Silurian at last."

As Bodewin put Josephine on her saddle again, he said to her, "Whatever it was you accused me of in your own thoughts, let it rest until I can talk with you again."

"Still harping," she replied, and hurried after Mr. Hillbury, who had mounted and ridden on to join the Craigs. Bodewin followed musingly, and did not attempt to lessen the distance between them.

VII.

MR. CRAIG GOES A-HUNTING.

THE lake, when they reached it, was, after all, in size hardly more than a large pond. It was on the edge of the timber, a clear, still eye of water, darkly bordered by pine-trees, with one bright spot of reflected blue shining in the middle, like an immeasurably far-off sky in the depths of the lake. They dismounted again and spread out their lunch in the dappled shade. It was not an hilarious picnic. Mrs. Craig and Josephine were both tired. The latter was also dazed with her long discussion on the rocks in the blinding sunlight. Bodewin, she thought, must be of the salamander species, since he was so sluggish in the shade and woke to such a burst of argumentative energy in the glare of the sun. He ate little and talked less, relapsing into the background of conversation, as his wont was when it became general.

When the sylvan meal was over, Mr. Craig unslung his bird-gun from his saddle and clambered down into the heavier timber, in search of wood-pigeons, he said, an object which excited the derision of the other men of the party. Bodewin referred to the "man

in the wilderness," and asked Mrs. Craig, as an authority on nursery rhymes, to quote for him:

"The man in the wilderness asked me
How many strawberries grew in the sea.
I answered him as I thought good —
As many as red-herrings grow in the wood."

"What are you laughing at?—because he goes to the wood for wood-pigeons?" asked Mrs. Craig.

"To this particular wood," said Hillbury. "You would not laugh at a man for going to the sea for fish; but if he were much of a fisherman, he would hardly go to Baffin's Bay for mullet."

"Oh, you are all so technical," said Mrs. Craig; "for my part I think a little vague general information is much more restful."

They sat under the low spruce boughs by the lake, talking and listening in the rustle of the deep tideless water and the sur-r-r-ing of the wind in the trees. Mr. Hillbury produced his fossils, delicate forms of earliest organic life imprinted in glistening pyrites on the dark Silurian slate. The ladies held the fragments of the old sea-beach on the palms of their hands, and examined them with a magnifying glass, exclaiming over them in their soft staccato. Once there came from the wood the sound of a single shot. Bodewin and Hillbury both recognized it as the note of Craig's gun.

"He has found the wood-pigeon!"

They waited for a second shot, but none came. When the slanting sunbeams had pierced their covert, they abandoned it and strolled along the shore of the lake. Mr. Hillbury walked with Josephine, pointing out to her the long formless ridges which marked the recession of one of those vast glacial seas that had crawled down the mountain-sides during the epoch of ice. The lake had been formed between two of these ancient moraines. Solitary, unvisited, bare of human association or tradition as it was,—*"foster-child of silence and slow time,"*—its cradled waters were uncounted centuries old before the story of man was begun.

Bodewin jeered at his friend a little for his popular science, and was rebuked by Mrs. Craig. She had herself more than once interrupted Mr. Hillbury, and asked for a moment's silence, during which she seemed to listen for sounds from the wood.

The afternoon wore away. The sun dropped below the western ridge and left the lake gray in shadow. Since the single report of his gun, nothing had been heard from Craig. His wife could no longer conceal her wretchedness at his absence. She sat, pale and silent, looking from one to the other, while Bodewin and Hillbury persistently made light of it, mean-

while planning a search for him on the excuse that it was already late for their homeward start. The pleasure party had reached a pitch of demoralization, as far as the women were concerned, when Craig was heard shouting from the opposite shore of the lake. He was walking fast under the trees, apparently none the worse for the gun he carried over his shoulder. Mrs. Craig was a little overcome at the sight of him, and laughed in a nervous, immoderate way at her late fears; but she recovered herself when Craig arrived, red and out of breath with his hurried walk around the lake, and received him with lively up-braidings. He was unnecessarily cheerful, and he had besides an important air of adventure about him which, under the circumstances, called for immediate snubbing. When he had been brought to a proper sense of his weakness and evil behavior, he was allowed to tell his story.

"But first, where is the wood-pigeon?" said Hillbury.

"Oh, I found her, but I didn't bring her home!" Craig did not mind confessing, he said, that he had missed his bearings. "One part of the wood looked so confoundedly like another, and there was no wind."

"No *wind*!" his wife interrupted.

"Not in the timber — not a breath — and mighty little sun. You are higher up, remember. You had an hour's more sun. I began to think I had been walking about long enough without getting anywhere, when I heard a horse whinny. A few steps on I came to a corral, and just beyond it, a bigish log-cabin. The back end of it ran butt into the dump of an old prospect hole. The ground rose suddenly behind the cabin, and the dump sloped up against the hill. There was a long bench by the door, and there sat the prettiest girl, in a calico dress, with her arms bare, feeding a setter-pup! She had him in her lap, and he was nuzzling about in a saucer of milk she held, and sometimes licking her arms by mistake. She had one of those low Greek heads my wife likes so much, with small intelligence in it, I should say, but plenty of hair on it — yellow hair, braided in two tails and wound around the head. I asked her the way to the lake. She stared at me and said she didn't know of any lake, she hadn't been in these parts long. She had a kind of sweet, stolid way that was uncommonly taking in connection with her looks. I wanted to look at her a little longer, so I asked her if the pup was for sale."

Mr. Craig was here interrupted in his narrative by laughter and applause.

"She said that she didn't know. Her father wasn't home. I might call again and inquire.

I asked her when I would be likely to find her father at home in case I called. She couldn't tell. Her father was mostly home except when he went to the camp, or over the range to a prospect he had there.

"By the same token, I asked permission to climb up the dump and see if I could get a better view of my surroundings from the top of it. She gave me permission and followed me up there with the pup in her arms. There was just a streak of sunlight left. It touched her hair very prettily, and it showed me which way was west, and so I made for the lake and left her there, making no end of a pretty picture of herself, with the sun on her golden hair."

"The man in the wilderness asked me
How many strawberries grew in the sea.
I answered him as I thought good —
As many as pretty girls grow in the wood,"

laughed Mrs. Craig.

"Come, saddle up, saddle!" said Bodewin. "We won't get out of the woods now before dark!"

Mr. Newbold had ordered a supper for the party on their return. Mrs. Craig excused herself on her children's account from remaining to it. Craig, as he rode away beside his wife, called back to Hillbury:

"The next time you go up the lake way, look up my cabin in the timber, will you? I'll commission you to get me that setter-pup."

"I don't see how you stand so much of Craig," said Bodewin crossly.

"Craig is a good fellow."

"A good fellow, yes — and a common fellow. It makes me sick to see him ride."

"He rides well enough," said Hillbury. "The fact is, there isn't one man in a hundred one can spend a day in the woods with."

"As for that cabin and girl and pup story," Bodewin went on.

"Don't you believe it?" asked Hillbury.

"Hardly. I am tolerably well acquainted with those woods myself. He got himself lost, like the cockney he is, and invented this story to carry it off. That sunlight-on-her-yellow-hair business is rather too musty."

"I think you are mistaken, Bodewin. Craig to me looked and talked like a man who had just had that sort of luck, to be stumbling along disgustedly and suddenly come upon the little idyl in the forest. If it were an invention, why put in the old prospect hole and the setter-pup?"

"It is possible he has seen such a cabin and such a group by the door, but I doubt if he saw them this afternoon."

"Bodewin, I will bet you a box of cigars I will find that cabin myself within a week."

"You'll waste your time and lose your cigars,—and Craig is an ass!"

They were in the office of the Wiltsie House, sitting on the row of chairs along the wall opposite the clerk's desk. In the confusion of unmodulated voices their own lower tones were lost.

"How long would you be a friend of Mrs. Craig if she knew you thought so?" Hillbury asked.

"I am not indebted to Craig for his wife's acquaintance. I knew Mrs. Craig years before he ever saw her. At a pinch I dare say she could exist without me, and I possibly without her. There are times when I find Craig too great a discount on the friendship of any woman."

"What is the matter with you, old man?"

"Hillbury," said Bodewin, with a sudden change of manner, taking a small, worn, leather note-book from his pocket, and turning over its pages absently, "I wish the Lord would let me burn this book!"

"Does he hold you responsible for its safe keeping?"

"It looks like it. I have dropped it down shafts; I have left it in my old coat-pockets when I moved camp, and had it sent back to me; I have, within the past year, taken it out more than once with as deliberate intention as I have of going to bed to-night of destroying it. Upon my soul, I can't do it!"

"What have you in it?"

"Only some memoranda relating to the Harkins and Eagle Bird suit. The Eagle Bird people want me to appear on their side."

"So I have heard," Hillbury said, much interested, and quietly observant of his friend. He had speculated not a little upon the probable meaning of Bodewin's reluctance to testify on this suit, even as he often speculated about Bodewin himself; but the two men might have been sole occupants of a light-house for a year, without its once occurring to Hillbury to ask his friend the question Miss Newbold had posed him with an hour after his introduction to her.

"Yes," Bodewin continued. "It's a horrible nuisance. I would like to tell you about it, but you know me too well, Hillbury. I should hate to have the thing perpetually associated with me in your mind. The only people, after all, to confide in, are those whom you like at first sight, and never expect to see again."

"I don't agree with you, but then that's nothing new."

"I will tell you this much," Bodewin began, but Hillbury interrupted.

"Why tell me anything? I am not suffering for your confidence."

"Because it bores me so! I am sold into

bondage! I am under an obligation to Harkins,—a most delicate, personal, strenuous obligation. It is a thousand times worse than if he had saved my life. It involves——" Bodewin found he had been precipitate after all. He could not say to Hillbury, whose people in the East knew his own, "It involves my sister's name and memory." He paused, with his friend's dark, grave eyes resting on his face, and ended stupidly. "It involves the name of a woman—one of the sweetest God ever made for man to destroy. If I have to balk Harkins's game, he is just clever enough to see that here is his revenge. Don't I know with what an unholy glee he would parade my obligation to him and his generosity to her whose name I must protect?"

"Bodewin, my dear fellow, will you forgive me for saying this whole thing, as you hint at it, sounds to me fantastic and morbid. I have always suspected you of a dangerous kind of enthusiasm in your moral processes. The business of living is, after all, nothing but a series of investments at a high rate of interest with corresponding risks, or at a low rate with good security. I am afraid you go in too much for the ten per cents, and the risks in your moral investments. You will go into bankruptcy if you are investing in Harkins and his crowd."

"What do you mean by going into bankruptcy?"

"Well, I don't mean wickedness, in your case. But despondency, want of grit. You'd better stick to the plain lines of duty, so far as Harkins is concerned, and let the dead past bury its dead. It occurs to you, no doubt, that this is a little gratuitous on my part; but I am older than you, and on some points not so sensitive."

"Not so vulnerable, you mean," said Bodewin, with a touch of bitterness.

Hillbury had no time to respond before Mr. Newbold joined them with his daughter's excuses instead of her company. She was tired, he said, and did not care to change her dress. "She'd have come down fast enough if Mrs. Craig had staid, but she's not accustomed to be the only lady; and the restaurant, you know, at this hour——"

The green-baize-covered door of the dining-room closed upon the sentence.

VIII.

BODEWIN'S SISTER.

BODEWIN belonged to that generation of the country's youth which was hurried into premature manhood by the shock of the civil war. He was sixteen the spring of 1861,

when his elder brother left home in response to the President's first call for volunteers. That summer young Bodewin went up to Yale to pass his preliminary examination. He was already a man in stature, and it was thought the best way to keep him from haunting the recruiting offices. The second year of the war closed darkly, with Burnside's losses before Fredericksburg, which increased the demoralization of the Army of the Potomac, on which the hopes of the East were fixed. Bodewin entered with all the passionate pessimism of youth, debarred from action, into the uncertainties of the situation. If disruption were at hand, he did not care for his future; if the war were to be successfully and honorably brought to a close, he could not accept it at the price of some better man's life. Thus he brooded, sitting on the college fence, under the budding elms, in the sad spring twilight.

He wrote to his brother for advice. Captain Bodewin told him plainly that his place was with the non-combatants for at least four years to come, and reminded him that in all wars, in all ages, the widow has ever been entitled to one son. This was not the advice young Bodewin wanted. In the face of it he abandoned his books and followed his boyish leadings into the army, enlisting as a private in his brother's regiment, the — Connecticut Cavalry. He served faithfully, but without distinction, until the close of the war. When the armies were disbanded he went home alone, an old-looking boy of twenty, already acquainted with grief, lean of cheek and limb, with hollows under his young eyes, with a habit of silence, with the discipline of ten years crowded into two — a discipline with stern limitations, however. He had learned something of endurance, of obedience, and of self-restraint; but of the world of men and women he had been spared to spend his life among, he had all to learn.

The house had lost its mainstay, — that elder brother whom the mother believed wise Heaven had given her to be the support of her widowed years. He had fallen in the last great charge of the war. His loss was embittered to Bodewin by a sense of its needlessness, for the struggle was virtually over. It seemed as if the lives lost that day were but heaped upon the over-full measure of the nation's dead, in the very wantonness of sacrifice.

The night after the battle Bodewin searched the field for his brother's body. A comrade kept at his side, and helped him in his last poor services to the dead. The young men were of the same regiment, each had seen and approved the other in action; beyond this they scarcely knew each other's names. As they

stood together by the new-made grave, in the white dawn before sunrise, Bodewin had said to his comrade:

"My mother must thank you for this night's work."

They parted with a promise from Lieutenant Eustis that he would visit Bodewin at the latter's home if both lived to see the end of the war.

Eustis had accepted the invitation with some diffidence.

"You must not ask me under an impression that I was a friend of your brother's," he had said. "I admired him greatly, but I am bound to confess that, so far as I know, the feeling was not mutual."

Bodewin could not have known that this scrupulousness was far from being characteristic of Frank Eustis. It was a genuine touch of candor and humility won from him by the circumstances which had brought the two young men together; but it was misleading, as only nature can be.

Bodewin took up the responsibilities death had laid on him in a condition of mind and body calculated to breed morbid views of duty. He was physically relaxed by the reaction which followed the change from army life to the life of home. The heaviness of his first sorrow was upon him. There was, besides, the dawn of another sorrow he could not blind himself to. It could hardly be called a change in his mother; a lapse, rather, of the powers mental as well as physical — the mark left by the war on a gentle nature, strong only in its affections. The heart of the family she would be, ever. Its head she had ceased to be.

Bodewin resigned his hopes of a profession and applied himself to the resuscitation of his mother's property. His father had for fifteen years held a professorship in an Eastern college. Late in life he had married the only surviving child and heiress of Simeon Wills, a member of the Society of Friends, and a well-to-do farmer, who had widened his landmarks on the Sound shore of Connecticut until they included about three hundred acres of salt-marsh, sea-beach, woodland, and stony pasture. To their grandfather's house Tristram Bodewin's widow had taken her children after her husband's death, and since that time, early in their childish recollections, they had known no other home.

True to her father's faith herself, she had not tried to make proselytes even of her own children, but to each one in different degrees she had transmitted that quiet persistence which was one of her own least conspicuous but most inherent traits.

Bodewin had left his sister a child. A child she still seemed to him, although she was tall

for sixteen, when to the broken household came Eustis in his faded cavalry uniform, with his record of fifty battles and that last service of his to the dead son of the house to aid him in making an impression. Ellen Bodewin was not a beauty, but in many ways she was beautiful. In after years, when the thought of his sister had become the permanent ache of his heart, Bodewin always saw her as he used to see her that summer, crossing the grass at twilight in her white dress and black ribbons, her profile distinct, almost luminous in its fairness, against the mass of dark-green shrubbery.

Bodewin spent many hours that summer at the black, pigeon-holed "secretary" in the dining-room, employed in a retrospect of accounts which invariably closed with the balance on the wrong side. The short, warm evenings he spent with his mother, in the unlighted parlor, where she lay on her sofa in the exhaustion of spent and tearless grief. In those silent sessions with their dead mother and son alike felt that the child of the house should have no part. Her share in the family sorrow had been less, as her knowledge of her brother was less than theirs; and her age was not ripe for sorrow. Yet they would have keenly resented any outside suggestion that Ellen took their great and common loss not sufficiently to heart.

Eustis came for a week the first time. He spoke of business engagements in New York. Bodewin found him there a month later, looking haggard and seedy. An old wound he had carried since Fredericksburg had been troubling him, he said. His family were in Genoa, where his father held a consulship. Bodewin asked him to come to Cranberry Beach for another fortnight, and incidentally lent him a little money. Again Eustis and Ellen were together, and in the still midsummer weather another tragedy of the war was hurrying to its consummation.

There was a granite boulder on the edge of the lawn where it sloped toward the pied salt-marshes, cool, deeply bedded in ferns, and shaded by a clump of maple-trees. A breeze from the blue water beyond the marshes was always blowing in their tops. On the hottest days, when the close-sheltered house dozed in the sun, Eustis, with the chess-board and the hammock-cushions under his arm, followed by Ellen with the last magazine, crossed the dry, scintillating grass to this island of coolness and shadow.

They were as secluded here, with the fields of heat making a wide stillness around them, as Ferdinand and Miranda in the island cave. There were sandy paths through the scrub oak and barberry bushes leading to the shore,

and there was a shallow river winding through the marshes, down which they drifted, sitting face to face but seldom speaking. All these landways and waterways they had taken together before the fortnight was over. They led all in the same direction, and ended in the catastrophe of a young girl's life.

In those days men were worshiped because they were soldiers merely. They needed no other attribute, and Eustis possessed several others besides that perilous association with a brother's memory. When after the second visit Bodewin heard his mother ask Eustis to come to them again at Christmas, if his family were still abroad, it occurred to him at last that they were seeing a good deal of their summer guest. On his next visit to New York he took pains to make some inquiries about Eustis. It was like going to a shelf piled with rubbish and pulling at a corner of the lowest object of the heap. He found a clew to one shabby little affair in looking up Eustis's antecedents, and the rest came tumbling about his ears. It was sickening, but it was a necessary lesson for the protector of a family of women to learn, and Bodewin congratulated himself on having learned it in good season. He was alone with his mother in the dining-room on the evening of his return. It was now late in October, and the evenings were cool. The blaze of a few sticks on the hearth was the only light in the room, while the open door showed a broad patch of moonlight on the hall floor, squared with the shadow of the window sash. Bodewin told his mother all that seemed necessary of his discoveries in regard to Eustis.

"He must not come at Christmas, or at any other time," he concluded.

Mrs. Bodewin seemed troubled beyond a reasonable conception of any feeling she could possibly have in the matter. Did he wish the acquaintance to cease? she asked her son.

"On the part of the women of the family, yes," he replied.

She reminded him of the family obligation. He assured her he would take care of that. In the greatest agitation she begged him to be careful what he said, for his sister's sake.

"What has Eustis to do with my sister?" Bodewin inquired, and then the blow came. Eustis had asked Ellen to be his wife. She loved him, and only waited for the consent of her mother and brother. The former had already given hers. Ellen had been receiving letters from Eustis since his last visit. The mother had felt obliged to speak to her about them. She had first done so during Bodewin's absence, and had then received her child's confession that Eustis had offered himself to her before his departure. She had not per-

mitted him to speak to her family then, because the time had seemed unfit.

"She was not ashamed to do the thing she was ashamed to speak of!" Bodewin burst out passionately.

"She is but a child! What else can she be?" the mother pleaded. "And she has not answered his letters or given him her promise except on conditions."

"Eustis is not the man for her to be making conditions with, mother! If she is a child, she must be treated like one. She must be prevented from doing herself this injury."

"It is done, it is done!" the mother wailed, "and we have done it. It lies at our door."

"It lies at my door!" said Bodewin. "Mother, I no more imagined any danger to Ellen in his being here than to you. How was I to know a girl is like that? To be won in a week, in a month, by the first man who looks at her! To be thinking of a lover, with her brother not six months in his grave!"

"Hush!" his mother said, rising and pointing towards the door as she faltered towards him. He turned and confronted his sister. She had heard his words distinctly in the quiet house as she came down the stairs from her chamber. What influence Bodewin might have gained over her, when his revolt against the pang of self-conviction cooled, had she never heard those wild words, may be questioned. As it was, the insult had struck too deep for explanation or retraction. There was, perhaps, enough of truth in the words to make them unforgivable. Bodewin patiently went over the charges against Eustis with his mother, and in turn she endeavored to set them before Ellen. The effect they produced was one of repulsion, not towards the accused, but the accuser. She was prepared for prejudice in one by whom she had herself been misjudged, and the seeds of counsel fell upon stony ground. There were long heart-breaking arguments between mother and daughter, and hopeless consultations between mother and son. But the brother and sister were no longer on terms of argument or consultation, still less of entreaty.

The struggle ended as it must always end between young love and old decrees. It was a relief at last when the marriage took place, two years later. Ellen's position had come to be that of a martyr persecuted by her brother for her faithfulness to her lover; for the mother had not been able to keep a consistent attitude of protest, and long before the marriage took place had offered but a passive resistance. Her losses had weakened her power of enduring the pain of those she loved. The risks of Ellen's marriage were in the future, while the sight of her unhappiness was an ever-present

torture. Nor was it possible for a woman with Mrs. Bodewin's experience of men and of marriage to conceive what those risks were likely to be with one like Eustis. She had no real conception of Eustis himself,—a man who could not be relied upon even in the direction of his weaknesses, for with a fatal inconsistency he had not been at all weak in his pursuit of Ellen. He had been as true to his purpose as if the truth were in him.

According to his weakness and her strength he no doubt loved her, and the purest sentiment of his life kept him at his highest level during the months of his probation. There were times when Bodewin was ready to believe that it was he who was the victim of hallucination, and that Ellen's case was indeed one of persecution, so filled was the house with that sense of her outraged love which her mute presence conveyed. But on the day of her marriage, in that searching light in which love, acknowledged and triumphant, exhibits itself, Bodewin saw that he was not mistaken. In certain sure and subtle ways he felt that the bridegroom was hopelessly beneath the dignity of his part. It could only be a question of time.

It was now thirteen years since the day of his sister's marriage, and during ten of those years Bodewin had held himself ready for the time when she would need him. His life had been ordered solely with reference to that time and that atonement he believed he would be permitted to make his sister for the husband he had given her and the father he had given her children. He thought no more of marriage for himself than if his mother and sister had been the only women in the world. He felt that his sister held a mortgage on his life, and year by year the unpaid interest went to swell the debt.

Eustis took his young wife to Virginia City, where he began his business career as a broker in mines and real estate. In the course of a year or two he had joined that wandering community which follows the changes of luck from one mining camp to another.

Bodewin made mines his business also, in a different way, partly that he might not lose sight of his sister on her unblest pilgrimage, partly because the event had proved that he was no farmer, and he needed to put money in his purse for the time when his sister would accept his atonement. The mother still lived at Cranberry Beach, in the retirement that suited her health and circumstances, with an unmarried sister as her companion. Those lapses of memory which had first warned Bodewin of the break in his mother's strength were now her greatest mercy.

Ellen seldom wrote, never unless in times

of comparative prosperity ; and as these grew more and more infrequent, the letters came at longer and longer intervals. They knew that children were born to her, and that she had lost children, but of the nameless humiliation of her life, of the eddy of shabby cares in which it went round and round, wearing into her soul, they could but silently conjecture ; and as one prophecy after another of all those that had been made concerning her marriage fulfilled itself, she wrapped herself more and more closely in the fate she had chosen, and hid her wounds with a pride that seemed all that was left of her love for her brother. The loving can never understand those who have ceased to love ; and as little as he could comprehend the sundering of a life-tie like that between himself and the sister he had so innocently and hopelessly injured, still less could Bodewin fathom the mystery of a weak man's hold on the life of a strong woman, who holds forlornly to her own pure vow, as the sanctification of the shame it covers.

IX.

THE TENDER MERCIES OF THE WICKED.

ONE day, now three years gone, in the Mining Exchange in San Francisco, Bodewin took up a Deadwood paper, a week old by its date, and saw a notice of the death of Frank Eustis. His body had been found in the street, dead by his own hand ; "probable cause, domestic anxieties and drink." The notice was headed, "Good-bye, Frank !" Bodewin learned more of the affair later in Deadwood from Henry Wilkinson, a lawyer of his acquaintance, with whom Eustis had spoken last. Wilkinson had met Eustis about twelve o'clock the night of his death, as he himself was coming out of the Varieties Theater with the crowd. Eustis was hurrying along through a light fall of snow, bare-headed and half wild with drink.

"For God's sake, Henry, lend me five dollars !" he had said. "I expect my wife and four children in by the stage to-morrow night, and I haven't so much as a roof to put over their heads."

"That wife-and-children game is about played, Frank," had been Wilkinson's reply. Eustis had been borrowing money for six months or more, on the strength of the imminent arrival of his family.

"They are coming this time, by God ! But they won't find me here !" were his last words as he ran on down the street, slipping and falling at last in the soft snow.

Wilkinson had pulled him up, set him on his feet, brushed the snow from his hair and

neck, and, putting his own hat on his head, had left him staring stupidly before him.

He was found the next morning, stiff and cold, with his head on the curb-stone and a bullet-hole in the side of it.

The night following that morning Ellen Eustis arrived with her children. There were but three. To the last Eustis had not been able to help lying a little in an unimportant way. His wife had come by stage, two hundred miles across the northern desert. She had waited, in the last poor refuge where he had left her, for Eustis to return or send for her. His letters spoke of his success in the new camp, but there were no inclosures of money and no summons for her to join him and share his success. At last, when her means of support were nearly exhausted, she had taken what money remained to her and desperately followed her husband, to what end she knew not, except that it could not be worse than the one she had in view. The man who saved her from dying on that journey was Colonel William Harkins. As an experienced traveler, the Colonel had secured for himself the entire back seat of the coach, and with lunch-basket, rugs, seal-skin coat, cigars, and paper novels, had expected to make the trip across the frozen alkali plains in comparative comfort.

It was just his luck, so he commiserated himself as he surveyed his fellow-passengers, to find in front of him, occupying the middle seat, a wan-cheeked young mother with three pretty, thinly-clad children, vis-à-vis with two Chinamen and a Jew "drummer," riding on the forward seat.

The first day's ride was not half over before Harkins had "borrowed" two of the children, and was telling them stories and romping with them, while the mother from time to time looked back and smiled at the sound of their laughter. When the boy grew sleepy he helped her to make a bed for him on the seat beside her, and arranged his traveling-bag under her feet, that she might the more easily support the child's head in her lap. At the squalid meal station he thrust her into the warmest corner by the fire, and bribed, from the meager hospitality of the place, the best it could furnish for her comfort. He led the way back to the stage with the youngster on his shoulder, and, putting him into his mother's arms, begged her to keep his seat for him while he walked on a mile or so for exercise. Not to be burdened with it while walking, he threw off his fur coat and asked permission to wrap her and the little fellow in it, until he should need it again. For the little fellow's sake she allowed him to do so. Laughingly he cuddled the two little girls in his rugs, and bidding

them let no one into his seat in his absence, trudged on ahead of the stage. When it overtook him he climbed up beside the driver and sat there smoking until it grew dusk. Looking back into the coach, he saw that the mother and children were asleep, snugly wrapped in his rugs and furs. He called himself a d—— fool, took something to keep out the cold, and crawling down into the boot under the driver's blankets, slept there all night on the mail bags. The mother began the next day with an effort at independence, but was soon too much exhausted by the unavoidable hardships of the journey and her children's constant claims on her strength to resist the ingenuous and persistent kindness of her fellow-traveler. The Colonel's luxuries were her necessities. He diverted them to her use with that understanding, cheerfully insisted on by him, and helplessly admitted by herself.

The stage office was buzzing with talk of the latest camp tragedy on the evening of the travelers' arrival.

"Oh, it is only some fellow got cleaned out at faro, and shot himself last night," Harkins replied to the young mother's inquiries, as she sat with her children around her in a corner of the crowded room. "What did you say your husband's first name was, Mrs. Eustis?—Frank? Well, see here! You'd better get a room here to-night. He didn't get your telegram most likely. I don't seem to see him anywheres about. We'll look him up first thing in the morning. Those children ought to have something to eat. I'll have something sent up to you. Now don't you worry, will you? You leave me to find your husband." So, talking rapidly, he hurried her away from the merciless gossip of the crowd, which suspended its words long enough to stare at poor Frank's widow as she passed out of the room.

Yes; it was just his luck — that the husband of his pretty, pale fellow-traveler should be the dead man whom the Masons were to bury to-morrow; that she should be nearing the time of her woman's utmost need, penniless, homeless, without a friend in the place. The next day he took her to a cabin in the outskirts of the town. It was her husband's house, he told her. This was the furniture Eustis had bought in preparation for her coming. These trifles of groceries and what not he had ordered in her husband's name; it was all the same. Evidently he had not been housekeeping himself and was a little hurried by her telegram. Then he *had* received it? — Where was he? What was he keeping from her? He met the question simply and squarely, cursing his luck again that there was no one but him to meet it. He had occasion to call

himself a fool with profane emphasis more than once that day, because he could not forget the new-made widow and her forlorn little brood. He mentioned her case to a lady friend of his, who promised to look after her should she need a woman's help. Harkins's lady friend was herself one of the poorest of the poor, yet those who have lost their all may still have something to give to another's distress.

Frank Eustis's wife had long ago learned how cruel are the tender mercies of the feebly wicked. It was only one more step in the long, downward path she had taken beside him,— the last step,— and it was characteristic of him that he had left her to take it alone.

It is a ten-days' journey, including the stage ride, from San Francisco to Deadwood with the roads in good condition. The roads were at their worst, and Bodewin, starting immediately on the news of Eustis's death, was two weeks on the way. He reached Deadwood one evening about ten o'clock, bruised, supperless, and stiff with cold. The usual crowd was gathered in the bar-room of the North-western Hotel. It seemed as good a place as any to begin inquiries for his sister. He was sure to find some of Eustis's friends there. When Bodewin asked news of Eustis's wife there was a dead silence in the room. Colonel Harkins stepped out of the crowd, and taking Bodewin apart, asked:

"Who might you be, inquiring for Frank Eustis's wife?"

"I am Mrs. Eustis's brother," Bodewin replied.

"The devil you are!" he remarked, in the same low, deliberate tone. "You're a sweet brother! Why didn't you get in here two weeks ago?"

Bodewin did not make the mistake of representing this singular reception from a stranger. He was familiar enough with frontier manners to understand it as some rude form of championship of his sister, founded on his own apparent or fancied neglect.

"Never mind about two weeks ago," he replied. "Do you know where my sister is now?"

Harkins looked him over again carefully before he spoke. "Better take a drink and eat something."

Bodewin declined to act on this suggestion, and showed some restiveness under Harkins's prolonged interest in him.

"Come on, then," the latter said, and led the way into the street. Walking fast, without speaking, they came to that low cabin in the thinly built part of the town where the widow had found shelter. Harkins knocked at the door softly, or so Bodewin fancied.

"Is my sister not well?" he asked.

"She is well," Harkins answered solemnly, "since two o'clock last night."

He left Bodewin waiting at the door. After some delay it was opened by a white-faced, red-cheeked young woman, who stared at Bodewin, and looked as if she might have simpered a little if she had been less sleepy.

"Take a chair," she said. "Be you a friend of hers?" indicating with a motion of her head the closed door of an adjoining room.

"I am her brother," Bodewin replied.

"You don't say! Where are you from?"

Bodewin mentioned the place.

"How long is it since you seen her?"

"Nearly ten years."

"Well, I declare! I guess she's changed some. D'you want to see her to-night? She ain't laid out yet. There wasn't anything of her own fit to put on her. She could 'a' worn a white silk of mine; it's some soiled, but it might 'a' done with lace over the front of the waist. But the Colonel wouldn't hear to it. He's having a splendid cashmere robe made for her."

Bodewin got up and went to the door. He leaned in the open doorway, with his face towards the cool night, while a faintness that had overcome him passed. He felt the woman's hand on his arm. "Here, drink this! You look like you was goin' to be sick." She held a tumbler half full of whisky towards him. He asked for water, and she dipped him a glassful from a pail beside the door.

"You'd better not see her to-night," the woman persisted, following him into the room again, "though she don't look bad. She ain't been sick long. Did you know there was a little baby? It's dead too, poor thing! I expect *his* mother'll be glad it didn't live. There's enough of 'em to leave for other folks to take care of."

"Whose mother?" Bodewin asked, lifting his head to look at the speaker.

"Frank's mother. She's been sent for. Didn't you know?"

"Who sent for her?"

"The colonel did."

"Will you tell me who is the Colonel?"

"Ain't you acquainted with Colonel Bill Harkins? It was lucky for Frank's wife *he* didn't stand on no ceremony. They rode in the same coach from the end of the track. Why, man, he done everything for her! Fed her and kep' her warm, and tended her young ones, and she not fit for travelin'. He's paid her way ever since she got in. This here house he's rented for her, and everything in it was bought with his money, though he never let her know it. You don't know the Colonel! Well, it's about time you did!"

"Will you let me see my sister?" Bodewin said, rising.

He was taken into the cold inner chamber, where on a clean white bed a sheet, smoothly spread, covered without concealing a motionless woman's form. There was the outline of the low pillowed head, the hands unstirred upon the breast, the small, thin body sloping downwards, the little feet that propped the sheet scarcely higher than a child's. Bodewin knelt on the floor by the bedside, smitten hard and deep in every spot that anguish knows,—crushed, broken utterly. And the woman beside him — whom no one wept for, though she was more dead than death itself to all that makes a woman's life — hid with her thin hands the roses that stared on her white cheeks, and sobbed aloud.

Did she weep for herself only as a child weeps at the sight of grief, or remembering that laughter and jests of men, nevermore men's despairing tenderness, and hopeless, hard-wrung tears, were her portion forever?

When he was alone with his dead, Bodewin folded down the sheet and looked at what lay beneath. He had known in part, and prophesied according to his knowledge, but he was in the presence now of that before which prophecies shall fail and tongues shall cease and knowledge shall vanish away. In the mercy of God it was well with her at last, and with the child that lay beside her in its long sleep that life had broken only for a few feeble breaths.

Bodewin would have found it impossible to escape from the details of his sister's last hours, had he wished to do so. They were in the mouths of strangers, who made them the medium of intercourse unsought by him and unspeakably harrowing. He knew, from various sources, the full extent of his indebtedness to Colonel Harkins, through his sister. The conjunction was torture to him. He tried in vain to get rid of the pecuniary part of the burden at the least, but the Colonel refused to overhaul his back accounts. "It's all right," he repeated. "I haven't spent any money on her to hurt anybody,— nothing more than any man would do for a lady passenger."

The orphaned children had been taken home by a respectable matron of the neighborhood, whose offer of assistance had come too late to benefit the mother. The possibility had never occurred to Bodewin that his sister's children might be left to any one's care but his own, in case of their father's death or failure to provide for them. But, between the day of the funeral and that of Mrs. Eustis's arrival in the camp, he had time to think over his sister's last expressed wish, and to endeavor to reconcile himself to its provisions. She had

chosen to leave her children to her husband's relations, ignoring her own blood. It was but the finishing touch to the devoted consistency of her wifehood. They were his children as well as hers; though by his life he had forfeited a father's right, in death she would not deprive him of a father's place in his children's memories. His own mother should exonerate him and atone for his shortcomings in the new generation that carries with it always the seed of the last one's blighted hopes.

Bodewin accepted his sister's decision—not without a forlorn pride in her steadfastness. But it left him objectless, purposeless, with his atonement on his hands. He had waited long, had kept the chambers of his heart empty and ready for the guest who had failed him at the last—who he now knew had never meant to come. He fell to questioning his own motives. There had been smoke in the incense doubtless; there had been blood upon the victim. He was now but thirty years old, with that purity of color and sensitiveness of expression which is said to be nature's reward for a life of spiritual constancy; but he felt that he had parted with youth, and that the "gains for all his losses" could be quickly counted.

It remained for him now only to see Mrs. Eustis and settle on his sister's children an annuity from the money he had kept intact

for her use, and to say good-bye to Colonel Harkins. He needed no one to tell him who Colonel Billy Harkins was. It was only as "the Colonel" he had failed to recognize him. He would have parted with his right hand if he could so have sundered the connection between them. Did the Colonel perceive how it galled Bodewin, and privately enjoy his helplessness under the obligation? When the two men shook hands at parting, Bodewin asked Harkins to remember that the man who had been as a brother to his sister should be as a brother to him in so far as he might be able to serve him or his in the future.

"All right, brother Bodewin," Harkins replied cheerfully, renewing his hard grasp on Bodewin's hand, and meeting his eyes with a look as hard as his grasp. "I hope you will know your brother when you see him again."

All this was now in the past three years. The mercy Bodewin had been most alive to at the time was the fact that his mother was no longer capable of a great sorrow. The stretched chords had ceased to vibrate. She lived in a painless dream of the time before the war, when her husband had been with her and her children had not left her arms. All that had happened since then could only be recalled from the outside, and realized by her with an effort.

(To be continued.)

Mary Hallock Foote.

THE "LAMIA" OF KEATS

AND THE ILLUSTRATIONS BY WILL H. LOW.

BEAUTIFUL curves and delicate planes, outlines most pure and faces that smile like gods, meet us at every turn in that mental gallery of the Greek past where we keep the records of plastic art expressed by rounded forms—*intaglio*, low and high relief, medal, coin, and statue. Hitherto the mastery of the Greeks in sculpture has been a mystery on which writers have loved to form many a conjecture, many a fantastic air-castle of a theory. It has been a marvel to which there was no clew; a fact like the few great ones on which all things depend, but which no one is able to explain. Now that we begin to look deeper into the evolution of Greek statuary, the marvel becomes less absolute, but not less wonderful. Like the elves in the head-piece on page 245, the *genii* of Greek art were entangled in a labyrinth of custom and precedent religious and artistic, intellectual and technical; their smiles were those of prisoners who have learned to

make a garden of the house of their captivity and wrung a glory from defeat. It would have been indeed a miracle had Greek sculpture appeared of a sudden, without ancestry of any kind, without roots. But it becomes far more interesting when the veil is somewhat lifted and men find that it had concrete as well as spiritual forerunners, and that these were as far as possible other than the shapes of beauty we have learned to consider the only products of the Greek brain. Yet it is, after all, only a marvel such as any one can witness who will be at the pains to rear a butterfly from a crawling worm. Underneath the exquisite grace of Venus and the noble virginity of Minerva, below the serenity and polish of Jupiter, highest bred of gods, lie the legends of those terrible, grotesque, outrageous gods which plainly belong to another epoch, if not another race, and yet continue on and coexist with the higher creations during and beyond the classical age. Behind the train of lovely woodland

nymphs, of river deities and mirthful fauns, lies the shadowy world of hags, specters, vampires, of witches and hobgoblins, out of which the men of the Ægean fashioned their charming land of the invisibles. Where art demanded black shades for a background, these were softened into humorous forms, as in Pan, Silenus, and the satyrs; where the essential was horror, as in the Gorgons, they made the face most beautiful but suffering, and wound snakes in the hair to represent the harsher description of the poets. Yet the poets themselves had already infinitely softened and sweetened the aboriginal horror from which Medusa descended. It was a monster with distorted visage, great tusks, a protruded tongue, and all the traits of a fiend to whom unhappy mothers offered their first-born in sacrifice. The face of that early Medusa was preserved down to Christian times on little terra-cottas as a trifling decoration of buildings. So let us regard the cupids that struggle almost gayly in the tangle of ribbons on the page overleaf as the descendants of far grimmer geni' of love and of death engaged in the meshes of inevitable fate.

The head-piece is from Will H. Low's illustrations for a new edition of "Lamia," by Keats, soon to be published by the Lippincott firm of Philadelphia. It happens only too seldom that the work an artist is asked to embellish proves the one he has particular love for; but in the present case it has been Mr. Low's desire for many years to illustrate this richly tinted yet mournful tale, and the publishers have yielded to his demand rather than suggested the scheme to him. Even a little thing like the head-piece shows that Mr. Low has felt Keats's repugnance to the harsh, the grotesque, the barbarous; perhaps he has carried the sentiment farther. Recall what sort of a Lamia it is that Keats has painted in the forest of Crete, miserable because her shape betrays her nature:

"She was a 'gordian shape of dazzling hue,
Vermilion-spotted, golden, green, and blue;
Striped like a zebra, freckled like a pard,
Eyed like a peacock, and all crimson barr'd;
And full of silver moons, that as she breath'd
Dissolved or brighter shone or interwreathed
Their lusters with the gloomier tapestries.
So rainbow-sided, touch'd with miseries,
She seemed at once some penanced lady elf,
Some demon's mistress, or the demon's self.
Upon her crest she wore a wannish fire
Sprinkled with stars, like Ariadne's tiar.
Her head was serpent, but ah, bitter-sweet!
She had a woman's mouth with all its pearls complete.

And for her eyes—what could such eyes do there
But weep, and weep, that they were born so fair?
As Proserpine still weeps for her Sicilian air?
Her throat was serpent, but the words she spake
Came as through bubbling honey, for Love's sake."

Who would take such a Lamia, lovely notwithstanding her serpentine exterior, for the hideous "bugge" which in Greek tradition she is, a name potent enough to frighten stubborn babes, because of her reputation of an ogress that devours humankind? Among her Etruscan peoples Italy kept many barbarous ideas—nay, keeps them to-day—which had disappeared from cultivated Greece in Homer's age. Remember in Horace's warnings how not to make poetry that he says it really will not do for the writer with taste to explain on what grewsome food a Lamia has breakfasted. Undoubtedly he referred to the Lamia of the populace, and quite possibly also to scenes on the low sensational stage of his day. But in Hellas the bogey Lamia seems to have given way as early as Homer's epoch to a fable of King Lamos and the Læstrygons, far to the westward, who were great cannibals and in stature giants; they killed and ate the greater part of the comrades of Ulysses on his voyage home. But if we look eastward into Asia, the myth is found once more in one of its oldest forms as the Assyrian Lamas, a lion demon with a man's head, and as the Chaldean Lammas, a tribe of giants and demons. The Greek genealogy of Lamia refers to this when Lamia is called the daughter of Belus and Libya, Belus being a generic term for Assyria because Bel was a popular deity there, and Libya referring to the land of dark-skinned peoples in Asia still farther to the eastward. Thus can we guess under Greek sculpture a whole buried world of awful, distorted, disgusting forms; and so, back of Keats's glittering snake-woman is the far fouler Lamia. When it comes to the American artist who has undertaken a most difficult task, that of depicting deities and monsters, we find that he has taken one step farther off from the *baroque* and grotesque. Low's conception of Lamia as she appeared to Hermes, "a palpitating snake, Bright and cirque-couchant in a dusky brake," hardly admits more than the reptile's tail, and that only peeps from the herbage in which she crouches before the beautiful and ever-young Hermes adoring. In other respects she is a lovely woman, who shows her supernaturalness only by means of the crown of will-o'-the-wisp stars about her locks; and her face is full of gentle entreaty; her attitude is that of a worshiper. The nude Hermes before her is charming enough to invoke comparisons with a recently found statue—a standing Hermes, however, not a seated one—the Mercury and Young Bacchus of Olympia. Sweet in this little picture, which cannot be given here, Lamia remains gentle and lovable throughout the

HEAD-PIECE.

series, because she is Keats's Lamia and no other. She is tender and generous when Hermes, in exchange for a sight of his Cretan nymph, has granted her heart's desire, when she has been stripped of the scaly extremities that betrayed her old nature, and has renewed the full human shape lost ages before. The passion she has conceived for Lycius of Corinth is as pure as it is intense. Goethe's Lamia is a less lovable creature, though more human; she is the soul of a bride of Corinth, who, having met an untimely death, returns, under the guise of life, but with the fatal kiss of a vampire, through the stress of love for the bridegroom she never, while living, embraced. It is the same story of which Professor Child has collected so surprising a number of variants from Scottish, English, and Scandinavian ballads. The Lamia of Keats

enlists the sympathy, and at the end makes one hate the too just, the too exact pedant Apollonius, whose calm gaze penetrates her disguise, and recognizes the snake below the loveliest limbs.

Having solved in this bold way the appearance of Lamia before her metamorphosis, Mr. Low must grapple with a harder problem, the depicting of that Cretan nymph whose beauty, when his eyes have been breathed upon by the subtle Lamia, "dashed" even the thievish god himself; harder, because it is easier to conceive a figure having strongly salient traits than to draw a being like the nymph, who was simply a human beauty pushed to a godlike extreme.

"It was no dream; or say a dream it was,
Real are the dreams of gods, and smoothly pass
Their pleasures in a long immortal dream.
One warm flush'd moment, hovering, it might seem,

"NEAR-SMILING ON THE GREEN."

Dashed by the wood-nymph's beauty, so he burn'd,
 Then, lighting on the printless verdure, turned
 To the swoon'd serpent, and with languid arm,
 Delicate, put to proof the lithe caducean charm.
 So done, upon the nymph his eyes he bent
 Full of adoring tears and blandishment
 And towards her stopt: she, like a moon in wane,
 Faded before him, cower'd, nor could restrain
 Her fearful sobs, self-folding like a flower
 That faints into itself at evening hour;
 But the god fostering her chilled hand,
 She felt the warmth, her eyelids opened bland,
 And, like new flowers at morning song of bees,
 Bloomed and gave up her honey to the lees.
 Into the green-recess'd woods they flew;
 Nor grew they pale, as mortal lovers do.

In the picture given here the artist has chosen with tact the moment before Hermes has seen her; but she, conscious at his appearance, sits "near-smiling on the green," secure in the charm of invisibility which Lamia has cast about her in order that she may escape the frantic love-making of satyrs and other woodland deities. Note the line of the arm on which she gently leans, the restfulness of the other hand holding a spray of flowers, the soft intendment of her gaze. She, too, is a gentle, amiable creature, in no wise willing to give suffering to her admirers. Her ivy-crowned head shines against the clump of bushes, and near her is the nymph's looking-glass, a still pool of water in a plain broad bowl of granite which rests on the capitals of two broken columns sunk in the greensward. One of the finest of the large illustrations is the view of Hermes, not given here, sailing away on the miraculous wings of his cap, sandals, and caduceus, one arm lightly about his new love, and before them the "green-recess'd woods." The modeling of the back of the nude god is delightfully drawn, and his trailing left leg makes, with his body and left arm uplifted in slow ecstasy, a varied line of beauty quite beyond words to express. The nymph flies with him and one catches a glimpse of her face, in which there is no fear or hesitation, but instead the seriousness of the bride about to exchange her simple woodland life for the uncertainties of marriage with a god. Both figures admirably express easy flight through the air, such as gods may be supposed to use. It is a drifting like that of thistledown; it makes the impression we may suppose the savage to get on seeing for the first time a vessel that moves without the help of current or paddle or sail. But soon Keats takes leave of Hermes and the bride he won in such a Mercurial and Olympian way; and so must we pass with a sigh from the amorous deity and his Cretan mistress to follow the fortunes of the sweet witch and Lycius of Corinth, that youth for whose sake Lamia has outwitted the wittiest of gods, and driven a sharp bargain with the lord of merchants and thieves.

There is a legend among the Ojibways of a hunter named Otterheart who marries a strange damsel; she exacts a promise that he will never allow her foot to touch running water. Once he fails to see a little stream in the grass, and omits to carry her over it. She touches the water and turns into a beaver. The Arabian Nights tell of the bride who was a cat, and has to return to her rightful shape at sight of a mouse. Like stories are at home in Africa as well as Asia, India as well as far-off America, when our land was unconnected with those across the oceans by migrations or earlier ancestral ties. In the South Pacific is found the story of Ati, who caught a tapairu, or peerless one, in a fountain, married her, and tried to reach the under-world with his wife's guidance. She, too, is at last lost, as we know from the song of the Mangaian:

"She has descended again to spirit-world,
 Men praised the divine being first seen by Ati
 at the fountain,
 But his heart is now filled with grief."

During the reign of Roger the Norman in Sicily, a youth, bathing by moonlight, saved an unknown woman from drowning. He married her, but she disappeared with their child. Hector de Boece gives the same story in his history of Scotland; but the handsome youth fears that his lovely pursuer is a succubus, and gets a priest to exorcise her. Doubtless the pagans of northern Europe had tales of cannibal spirits of both sexes; thinly disguised in a Christian and French dress, one appears among the poems of Dan John Lidgate, the exhaustless monk of Bury, friend and disciple of Chaucer. Bycorne and Chichevache are ludicrous survivals of ghastly monsters of the pagan epoch, whose natures the satirist has slyly turned into a farce. Bycorne is enormously fat, because of an exclusive diet of husbands who are docile to their wives; Chichevache, on the other hand, is nearly starved, her bones stare through her skin, because the only food that agrees with her is a wife who has always obeyed her husband. Perhaps the farce of Bycorne and Chichevache was performed in London during Lidgate's day, for there are directions for the action of the two monsters. In Sanskrit is recorded the story of Bheki the beautiful, who marries a king and is turned back into a frog. In the same stately tongue is the legend of Pandarika Naga, a chief of serpents, like the Karkotaka Nagaraja of the story of Nala, who strives to escape the ruin of his race through magic by becoming a man. But he keeps his forked tongue and venomous breath, and when he marries Parvati, the daughter of a Brahman, these prove his un-

“There she stood
About a young bird's flutter from a wood,
Fair, on a sloping green of mossy tread
By a clear pool, wherein she passioned
To see herself escaped from so sore ills,
While her robes flaunted with the daffodils.”

doing. The list is very long; but this will be enough to show that the story which was told by Philostratus, an Italian Greek of about 200 A. D., concerning Apollonius of Tyana, a Cappadocian, who lived early in the first century, and obtained the highest renown for wisdom and magical powers, does not stand alone, but belongs to a widespread family of tales more or less closely similar.

The Lamia of whom Keats tells the mournful story in delicious verse becomes, under the artist's hand, the image of an innocent, loving, confiding maiden. She stands uncertain of her beauty and power to attract Lycius, gazing steadfastly into the pool that reflects her figure and face. Mr. Low has borne lightly on the landscape, yet how tender and springlike it is! It suits the virginal bosom of the young beauty, her bashful air and cool-blowing robes, those robes that flaunted with the daffodils!

"Ah, happy Lycius! for she was a maid
More beautiful than ever twisted braid,
Or sigh'd, or blush'd, or on the spring-flower'd
lea

Spread a green kirtle to the minstrelsy:
A virgin purest lipp'd, yet in the lore
Of love deep-learned to the red heart's core:
Not one hour old, yet of scintial brain
To unperplex bliss from its neighbor pain;
Define their pettish limits and estrange
Their points of contact and swift counterchange:
Intrigue with the specious chaos and dispart
Its most ambiguous atoms with sure art;
As though in Cupid's college she had spent
Sweet days a lovely graduate, still unshent,
And kept his rosy terms in idle languishment."

the management of light and shade, excellence in which many artists hold to be the same thing as, or at any rate the groundwork for, a colorist. He enjoys simple effects of sculpture and the contrast of planes in broad cool nudes, as may be noted in the picture of the nymph seated invisible and unclothed by the river, caressing the cool surface with one reluctant foot. Here in a side panel is a terminal pillar or "Hermes," but the marble eyes of the god are symbolically bound with a kerchief to indicate that the nymph will bathe unseen of him. Again, when disconsolate Hermes leans his head on his arms and his arms on a gnarled tree in the Cretan wood, unconscious of the grin on the stone face of a satyr crowning a terminal pillar near by, the effect of combination and contrast of simple stone-work and the human figure is excellent. Another quarter page is white with the large plain bench on which the nymph of Crete is seated; with both hands she obstinately closes her ears against the cajoleries of a nude Cupid, most winsome of little mischief-makers, who stands close and behind her on the seat. The feeling for contrast of lovely curves in the human figure and flat planes in architecture shows in the little picture of Lamia presenting to her foolhardy lover the palace which her magic has reared overnight for their wedding ceremony in "two-sea'd Corinth," as Horace calls the capital at the Grecian isthmus: the rich, the happy, the divine were the epithets of the Greek poets.

"WHILE YET THEY SPOKE THEY HAD ARRIVED BEFORE
A PILLARED PORCH WITH LOFTY PORTAL DOOR."

Here Mr. Low offers again a surprise by the method of distributing masses of light and shade, not heavily, but in a scattered order as befits the time, the hour, and the person, while the darkest shadow is in the robes just above the feet of Lamia. The young tree is like her, yet a contrast to the swelling lines of cheek, bosom, and arms, while behind is the rising sword pied with daffodils. Mr. Low has developed into notable strength in

"As men talk in a dream, so Corinth all
Throughout her palaces imperial
And all her populous streets and temples lewd
Muttered, like tempest in the distance brew'd,
To the widespread night above her towers.
Men, women, rich and poor, in the cool hours
Shuffled their sandals on the pavement white,
Companioned or alone; while many a light
Flared here and there from wealthy festivals,
And threw their moving shadows on the walls,
Or found them cluster'd in the corniced shade
Of some arch'd temple door or dusky colonnade."

In this little picture the drawing is very pure, and the distinctions of greater or less darks in the faces near together against the black background most pleasingly divined. In the large page, of the lovers meeting in the street with Apollonius the sophist, which cannot be reproduced here, these contrasts are even better managed, especially in the figure of Lycius as he raises his mantle so that the reflective yet observant eyes of his preceptor shall not perceive him or the gentle girl who shrinks close to him and holds with both her hands his strong bare right arm. The scene from an earlier moment, when the two have met, and Lycius faints on hearing from her lips that she is an immortal and cannot stay with him on earth, is beautifully composed. Lycius has sunk on one knee and with closed eyes is about to slip prone. Lamia leans over and supports his head from further degradation, while her left hand comforts his shoulder. As she leans, her hair forms a waving cloud above the fine line of her left arm. The draperies are very wisely made not unnecessarily complicated. About them are the trunks of olives and the branches of vine; at their feet, growing flowers. In the small scene of first recognition and love at first sight, the landscape is more remarkable than the figures, which are a trifle stiff; the distant river and sky are most poetic. The elaborate head-piece which ushers in the text must not be overlooked; it shows the Cretan nymph in a deep study, her robe slipping from her right shoulder and one bare arm hanging in front. To her right and left a satyr and a young river-god pour from horns of plenty

"—rich gifts, unknown to any Muse,
Though Fancy's casket were unlock'd to choose.
Ah, what a world of love was at her feet!"

It would be invidious to try forestalling by descriptions the pleasant surprises in the thirty or forty illustrations of this elaborate edition, even if it were possible to describe them adequately. Mr. Low has essayed French landscape and French peasant life; he has been patriotic in response to well-meant but often obtuse advice, which recommends at all odds an American subject for a native artist; and he has tried the historical field; nor has he omitted the composition of pictures in which figures take the attitudes of those on friezes. But nowhere have his great talents found their freest play until he began to conceive and rapidly make real his views of Lamia. A word as to the illustrations here. They are wood-cuts of the best class, but necessarily differ in some ways from the reproductions in the book itself. The latter show little or no interference with the exact product of the

artist, for they are photogravures by the process called Albertype, and while in some points they lose, in others they greatly gain by the faithfulness of the transcript. Delicate planes and intricate pieces of drawing sometimes suffer under the best engraving and the best printing, while the whole picture may have gained in spirit from the engraver's art. While the book is mentioned, it may be well to add that Mr. Low is responsible for the covers and the decorative linings. The design for the front is a system of a dozen or more garlands joined by a maze of ribbons, each garland having, within a mask, a Pan's-pipe, or other classical symbol, while the center offers an antique tablet which bears the title of the book. It is evident that the purpose was to make the exterior rich, but not too eccentric, and especially to avoid the prevailing fashion of placing landscapes and menageries on the book-cover.

"Lamia" is not considered Keats's best work, nor was it received by the public with the favor that met his other poems, though it represented the most mature state of that wonderful genius which was never to reach a healthy middle age. It has distinct marks of the lack of the file, and at least one place where a passage seems to have been left out. At the verses

"Or where in Pluto's garden palatine
Mulciber's columns gleam in far piazzian line,"

the poet has not fulfilled the promise, made a few lines before, to explain how Lamia could have marked Lycius in the chariot-race at Corinth while she was still bound to her snaky prison-house on the island of Crete. It is probable that a revision would also have caused the adjective "piazzian" to disappear for something better; Keats was such a bold coiner of new words that it would have cost him little labor. Many lines, too, which have a tendency to limp just a trifle would have been strengthened in gait. Dryden and Spenser, on whom he chiefly leaned for the technique and some of the rich coloring of "Lamia," were more than his masters in such respects; if Dryden made his lines irregular, the unevenness always had a motive; but it may be doubted whether even Spenser reaches Keats in the richness of his coloring. Keats carried sensuous verse to a point almost unknown before his day and possibly since, although there is at least one poet—he, by the way, has published a very inadequate summary of Keats—who, along with a very notable sacrifice of sense, has pushed the harmonics of verse, the clash of consonants and chords of vowels, a distinct step farther. But "Lamia" is an exquisite blending of the strength of Dryden

with the softness of Spenser, and who shall blame any one for placing it in his estimation before the "Eve of St. Agnes" and "Hyperion"?

The popular mouth repeats one line from "Endymion" oftener than any other written by Keats. Uttering it, Keats himself is described. When we quote threadbare the words "a thing of beauty is a joy forever," we do not always stop to realize the importance it carries as a phrase that sums up the work and character of the poet. So the Greek, while he counted his tetradrachms bearing a profile or an animal, a fish or a fabulous monster, modeled with exquisite art and yet with the ease of an every-day affair, never stopped to admire the bigness of that sculpture in the little on the silver piece; least of all dreamed that one day men would find such coins better and more certain proof of the supremacy of his race in the plastic arts than the discovery of a score of marble masterworks. Keats was uneven in performance, not severely classical in the nicer points of grammar, nor was his ear absolutely perfect for the tiptoe march of rhythms; but he was Greek to the finger-nails in his passion for beauty in itself. He might have been a *revenant*, and have come back to England as the new fleshly abode of the spirit of that young Greek whose memorial stone with its half-effaced inscription has been found at Brough, imbedded in the foundation of a church porch, the spirit of Hermes Kommagene, who was in England during the Roman occupation and either died near the present Brough, or, according to one reading, was among the missing, and may have become the slave of some savage Pict during a raid southward from the old Caledonian Wood. Keats was not only given to poetry heart and soul, with hardly room left, perhaps, for the proper entertainment even of love, but he narrowed his field in poetry. His best work was the odes which are among the greatest pieces of literature in English; close after come descriptive *contes* like "Lamia." It is his fate to be always associated with Shelley, who never cared much for him, notwithstanding the beautiful memorial he has raised to him in "Adonais," and was as unlike him as possible, morally and mentally. Keats was a saner, more bridled spirit than Shelley. He was thoroughly English in the limited sense of the word, and belonged in poesy to the line of Surrey, Carew, and Herrick; the product of a rich soil, the flowers he

bore were heavy with perfume, too heavy for some tastes. Shelley belonged to another race, for, however English residence had obliterated in his kindred the recollection of their Keltic strain, it was impossible to eradicate the Keltic nature. Shelley was far more spiritual, original, and fantastic. He lived in the clouds, and of clouds his pictures are made. Keats and Shelley should be placed side by side as foils to each other, not as kindred souls; for they represent alien races, who are to-day hostile in their attitude, in spite of eight centuries of intermixture. Shelley was born in the south of England, but he belonged spiritually and by race in the south of Ireland, where, indeed, his family name is not uncommon. In poetry he has lines of attachment with the literature that was revealed by Macpherson to English ears under the form of the Scottish Ossian. Keats is a true countryman of Milton.

The illustrations of "Lamia" by Will H. Low are in this age remarkable for the small stress the artist has laid on archæological exactness. His pictures are never encumbered with classical bric-à-brac. When we reflect on the fashion set by Mr. Alma Tadema and by French, German, and Italian painters, this is not a small point to note. He may be studied with advantage for the freshness and originality of composition in a good three-fourths of the work. The adjustments of figures to background and figures to figures, the delicate sense of light spaces and of dark, are matters that cannot be learned of masters or of books; they must be inborn. Mr. Low has extreme sensitiveness on these most important points. Mr. Elihu Vedder has treated the Fitzgerald rendering of Omar Khayyám's quatrains in a very different spirit, as indeed the poem itself is utterly different from "Lamia." Not so striking as the illustrations by Vedder, these by Low are possibly quite as likely to grow in favor and live. For while they do not force themselves so powerfully on the attention as the masculine cartoons of Vedder, they are more delicate and sustained in drawing, and have in uncommon force the quality that made Keats a great poet, the trait of pure beauty. He may not have gone so high or so deep for the visible rendering of Lamia as his American comrade in art, but within narrower limits Mr. Low has produced a series of delicate, graceful, and pure pictures, on which any artist and any people may look with pride.

Henry Eckford.

MRS. HELEN JACKSON ("H. H.").

IT is curious to see how promptly time begins to apply to the memory of remarkable persons, as to their tombstones, an effacing process that soon makes all inscriptions look alike. Already we see the beginnings of this tendency in regard to the late Mrs. Helen Jackson. The most brilliant, impetuous, and thoroughly individual woman of her time,—one whose very temperament seemed mingled of sunshine and fire,—she is already being portrayed simply as a conventional Sunday-school saint. It is undoubtedly true that she wrote her first poetry as a bereaved mother and her last prose as a zealous philanthropist; her life comprised both these phases, and she thoroughly accepted them; but it included so much more, it belonged to a personality so unique and in many respects so fascinating, that those who knew her best can by no means spare her for a commonplace canonization that takes the zest out of her memory. To describe her would be impossible except to the trained skill of some French novelist; and she would have been a sealed book to him, because no Frenchman could comprehend the curious thread of firm New England texture that ran through her whole being, tempering waywardness, keeping impulse from making shipwreck of itself, and leading her whole life to a high and concentrated purpose at last. And when we remember that she hated gossip about her own affairs, and was rarely willing to mention to reporters any fact about herself except her birthday,—which she usually, with characteristic willfulness, put a year earlier than it was,—it is peculiarly hard to do for her now that work which she held in such aversion. No fame or publicity could ever make her seem, to those who knew her, anything but the most private and intimate of friends; and to write about her at all seems the betrayal of a confidence.

I.

HELEN MARIA FISKE, the daughter of Nathan Wiley and Deborah (Vinal) Fiske, was born at Amherst, Massachusetts, October 18, 1831. Her father was a native of Weston, Massachusetts, was a graduate of Dartmouth College, and, after being a tutor in that institution, became professor first of languages and then of philosophy in Amherst College, having been previously offered a professorship of mathematics at Middlebury College,—a combination of facts indicating the variety of his

attainments. He was also a Congregationalist minister and an author, publishing a translation of Eschenburg's "Manual of Classical Literature," and one or two books for children. He died May 27, 1847, at Jerusalem, whither he had gone for the benefit of his health. His wife was a native of Boston, and is mentioned with affection by all who knew her; and the daughter used to say that her own sunny temperament came from the mother's side. She also had literary tastes, and wrote the "Letters from a Cat," which her daughter afterwards edited, and which show a genuine humor and a real power of expression. She died February 19, 1844, when her daughter Helen was twelve years old. Both parents held the strict Calvinistic faith, and the daughter was reared in it, though she did not long remain there.

Mr. and Mrs. Fiske had two sons, who died young, and two daughters, who lived to maturity; the younger of whom, Anne, is the wife of Everett C. Banfield, Esquire, at one time solicitor of the Treasury Department at Washington, and now a resident of Wolfboro, New Hampshire. The other, Helen, was a child of uncommon versatility and vivacity; and her bright sayings were often quoted, when she was but ten or twelve years old, in the academical circle of the little college town. She has herself described in a lively paper, "The Naughtiest Day of my Life" ("St. Nicholas," September–October, 1880), a childish feat of running away from home in company with another little girl, on which occasion the two children walked to Hadley, four miles, before they were brought back. The whole village had joined in the search for them; and two professors from the college finally reclaimed the wanderers. There is something infinitely characteristic of the mature woman in the description written by her mother, at the time, of the close of that anxious day: "Helen walked in at a quarter before ten o'clock at night, as rosy and smiling as possible, and saying in her brightest tone, 'Oh, mother, I've had a perfectly splendid time.'"

A child of this description may well have needed the discipline of a variety of schools; and she had the advantage of at least two good ones,—the well-known Ipswich (Massachusetts) Female Seminary, and the private school of Rev. J. S. C. Abbott in New York city. She was married in Boston, when just twenty-one (October 28, 1852), to Captain (afterwards

Major) Edward B. Hunt, United States Army, whom she had first met at Albany, New York, his brother, the Honorable Washington Hunt, being at that time Governor of the State. Captain and Mrs. Hunt led the usual wandering life of military households, and were quartered at a variety of posts. As an engineer officer he held high army rank, and he was also a man of considerable scientific attainments. Their first child, Murray, a beautiful boy, died of dropsy in the brain, when eleven months old, at Tarrytown, New York, in August, 1854. Major Hunt was killed, October 2, 1863, at Brooklyn, New York, while experimenting with an invention of his own, called a "sea-miner," for firing projectiles under water. Mrs. Hunt still had her second boy, named Warren Horsford, after her friends, General G. K. Warren and Professor Horsford, but commonly called "Rennie." He had, by testimony of all, a rare combination of gifts and qualities, but died suddenly of diphtheria at his aunt's home in West Roxbury, Massachusetts, on April 13, 1865. Mrs. Hunt was thus left utterly bereaved, and the blow was crushing. It shows the strong relation between mother and child, and the precocious character of her boy, that he made her promise not to take her own life after he should be gone. She made him promise, in return, that if it were a possible thing he would overcome all obstacles and come back from the other world to speak to her; and the fact that this was never done kept her all her life a disbeliever in Spiritualism: what Rennie could not do, she felt must be impracticable. For months after his death she shut herself up from her nearest friends; and when she appeared among them at last, she was smiling, vivacious, and outwardly unchanged.

Up to this time, although her life had been full of variety and activity, it had been mainly domestic and social, and she had shown no special signs of a literary vocation. She loved society, was personally very attractive, dressed charmingly, and had many friends of both sexes. Through her husband she knew many superior men, but they belonged almost wholly to the military class, or were those men of science whom she was wont to meet at the scientific gatherings to which she accompanied Major Hunt. It was not till she went, at the age of thirty-four, to live in Newport, Rhode Island, that she was brought much in contact with people whose pursuits were literary; and it was partly, no doubt, through their companionship that a fresh interest and a new employment opened most unexpectedly before her. How wholly she regarded her life as prematurely ended at the close of its first phase, may be seen by a letter written soon after establishing herself in Newport, when

she had gone to West Point to superintend the removal of the remains of her husband and children to that spot. After speaking of the talents and acquirements whose career was finished, she bitterly added: "And I alone am left, who avail nothing." She had yet to learn how much her own life was to avail.

II.

WHEN she went to live in Newport (February 10, 1866), she had already written poems, and had shown them to her friends. She had, indeed, when in her teens, published some girlish verses in the Boston "Press and Post," but her mature compositions had all related, so far as I know, to her personal bereavements. Of these she had published one in the "Nation" (July 20, 1865), this being in the very first volume of that periodical, which was edited by a personal friend, and which gave at first more space to poetry than now. This poem was called "Lifted Over," and consisted of fourteen lines of blank verse, referring to the death of her boy, and signed "Marah." The fact of its publication makes it likely that, wherever she had taken up her residence, she would have published more poetry of the elegiac kind; but it is doubtful whether her lyre would have reached a wide variety of notes, or whether she would have been known as a prose writer at all, but for the stimulus and fresh interests developed by her change of abode. In the society of her new friends she began for the first time to make a study of literary style and methods; she interchanged criticism with others, and welcomed it as applied to her own attempts; she soon ventured to publish more poems, and then to try herself in prose. The signature "H. H." first appeared, I believe, in connection with the first thing she published after her removal to Newport. This was a poem called "Tryst," in the "Nation" (April 12, 1866), followed soon by a translation—almost the only one she ever made—from Victor Hugo's "Le Soir" ("Nation," April 26, 1866), and by two poems called "A Burial Service" (May 22) and "Old Lamps for New" (May 29)—this last being, perhaps by accident, unsigned.

These were soon followed by poems in the New York "Independent," beginning with "Hagar" (August 2, 1866) and "Bread on the Waters" (August 9, 1866)—she still keeping mainly to her experiences of sorrow. Her first attempt in prose, under her own signature, appeared in the same newspaper for September 13, 1866, and was entitled "In the White Mountains." It was a sketch of a walk up Mount Washington from the Glen House,

and, though spiritedly written, gave little indication of her rising so far above the grade of the average summer correspondent as she ultimately attained. She also wrote an unsigned review of "Felix Holt," in the same number. From this time till her death she was an occasional correspondent of that journal, writing for it, as its editors say, three hundred and seventy-one articles in all. She wrote also in "Hearth and Home," and published a few poems in the New York "Evening Post."

Thus launched into literature, she entered with the enthusiasm of a child upon her new work. She distrusted herself, was at first fearful of each new undertaking, yet was eager to try everything, and the moment each plunge was taken lost all fear. I remember the surprise with which she received the suggestion that no doubt publishers would be happy to send her their books if she would only review them; and her delight, as in a new world, when she opened the first parcels. From the beginning she composed with great rapidity, writing on large sheets of yellow post-office paper, eschewing pen and ink, and insisting that a lead-pencil alone could keep pace with the swiftness of her thoughts. The remarkable thing was that, with all this quickness, she was always ready to revise and correct, and was also a keen and minute critic on the writings of others. It was very surprising that one who was not really familiar with any language but her own—for the Latin of her school-days had already faded and even her French was at that time very imperfect—should have such a perception of the details of style. She had, however, been well trained in English at school, and used to quote Kames's "Elements of Criticism" as one of the books she had read there. Both her father and mother had also taken an interest in her early school compositions.

A statement has been lately made, on the authority of the late Mr. R. W. Emerson, that she sent poems to the "Atlantic" in those early days, and that they were rejected. It is possible that my memory may not include all the facts, but I am confident that this statement is an error. It is certain that she was repeatedly urged to send something in that direction by a friend who then contributed largely to the magazine, but she for a long time declined; saying that the editors were overwhelmed with poor poetry, and that she would wait for something of which she felt sure. Accordingly she put into that friend's hands her poem called "Coronation," with permission to show it to Mr. Fields and let him have it if he wished, at a certain price. It was a high price for a new-comer to

demand; but she was inexorable, including rather curiously among her traits that of being an excellent business woman, and generally getting for her wares the price she set upon them. Fields read it at once, and exclaimed, "It's a good poem"; then read it again, and said, "It's a *devilish* good poem," and accepted it without hesitation. It appeared in the "Atlantic" for February, 1869, and another poem, "The Way to Sing," followed it a year after; but Fields never quite did justice to her poetry, while he greatly admired her prose, so that she offered but little verse to that magazine. Her "German Landlady" appeared there (October, 1870), and was followed by a long line of prose papers, continuing nearly until her death. Her little volume of "Verses" was printed rather reluctantly by Fields, Osgood & Co. (1870), she paying for the stereotype plates, as was also the case with her first prose volume, "Bits of Travel" (1873), published by their successors, James R. Osgood & Co. Soon after this she transferred her books to Roberts Brothers, who issued "Bits of Talk about Home Matters" (1873), and a much enlarged edition of "Verses" (1874).

She spent in all five winters at Newport, always at the same hospitable home,—Mrs. Hannah Dame's boarding-house,—and always going somewhere among the mountains in summer, early enough to keep off hay-fever, from which she suffered. Then she returned, late in autumn, preceded by great trunks and chests full of pressed ferns and autumn leaves, which she dispensed royally among her friends during the whole winter-time. These Newport seasons were interrupted by an absence of some fourteen months in Europe (November, 1868, to February, 1870), and she had several serious illnesses toward the latter part of the period. Indeed, she had an almost fatal attack while in Rome, and I am informed by the friend with whom she traveled, Miss Sarah F. Clarke, of a peculiarly characteristic act of hers when convalescent. Going to Albano to recruit, she refused to carry with her a professed nurse, as her friends desired, but insisted on taking a young Italian girl of sixteen, who had never had a vacation in her hard-working life, and to whom the whole period of attendance would be a prolonged felicity.

In May, 1872, she went to California with her friend Miss Sarah C. Woolsey; and in 1873-4, being convinced that her health needed a thorough change of climate, tried the experiment of a winter in Colorado. This State became soon after her permanent home; she being married in October, 1875, at her sister's house in Wolfboro, New

Hampshire, to Mr. William Sharpless Jackson, of Colorado Springs. They were married by the ceremonial of the Society of Friends, the bridegroom being of that persuasion. For the remaining ten years of her life she had a delightful abode and a happy domestic life, although the demands of her health and her literary work, joined with a restless and adventurous disposition, kept her a great deal in motion between her new and her old haunts. Nobody was ever a more natural wanderer. She always carried with her a compact store of favorite pictures, Japanese prints, and the like; so that, within an hour after she had taken possession of a room at the Parker House in Boston or the Berkeley in New York, she would be sitting in a tasteful boudoir of her own arranging. With this came an equally ready acceptance of the outdoor surroundings of each place; and in migrating farther west, she soon knew more of Omaha or San Francisco than the oldest inhabitant. Her wonderful eye for external nature traveled with her; she planned her house at Colorado Springs with an unerring adaptation to the landscape, and on one occasion welcomed a friend with more than twenty different vases of the magnificent wild flowers of that region — each vase filled with a great sheaf of a single species. She had always lavished so much adornment on one or two rooms that her friends had wondered what she would do with a whole house; and those who visited her at Colorado Springs beheld the fulfillment of their wonderings.

III.

FOR the second time she was to encounter a wholly new intellectual experience after adopting a new abode. The literary development, which had begun somewhat late, was to be merged into a moral enthusiasm, beginning still later. She wrote to an intimate friend (January 17, 1880):

"I have done now, I believe, the last of the things I had said I never would do; I have become what I have said a thousand times was the most odious thing in life, 'a woman with a hobby.' But I cannot help it. I think I feel as you must have felt in the old abolition days. I cannot think of anything else from night to morning and from morning to night. . . . I believe the time is drawing near for a great change in our policy toward the Indian. In some respects, it seems to me, he is really worse off than the slaves; they did have, in the majority of cases, good houses, and they were not much more arbitrarily controlled than the Indian is by the agent on a reservation. He can order a corporal's guard to fire on an Indian at any time he sees fit. He is 'duly empowered by the Government.'"

In this same letter she announces her intention of going to work for three months at the Astor Library on her "Century of Dis-

honor"; and it is worth noticing that with all her enthusiasm she does not disregard that careful literary execution which is to be the means to her end; for in the same letter she writes to this friend, one of her earliest critics: "I shall never write a sentence, so long as I live, without studying it over from the stand-point of whether you would think it could be bettered." This shows that she did not, as some have supposed, grow neglectful of literature in the interest of reform; as if a carpenter were supposed to neglect his tools in order to finish his job.

Her especial interest in the Indians was not the instantaneous result of her Colorado life, but the travels and observations of those first years were doubtless preparing the way for it. It came to a crisis in 1879, when she heard the Indians "Standing Bear" and "Bright Eyes" lecture in Boston on the wrongs of the Poncas, and afterwards met them in New York, at the house of her friend Mrs. Botta. Her immediate sympathy for them seemed very natural to those who knew her, but it was hardly foreseen how strong and engrossing that interest would become. Henceforth she subordinated literature not to an ulterior aim merely, for that she had often done before, but to a single aim. It must be remembered, in illustration of this, that at least half the papers in her "Bits of Talk" were written with a distinct moral purpose, and so were many of her poems; and from this part of her work she had always great enjoyment. So ready were her sympathies that she read with insatiable pleasure the letters that often came to her from lonely women or anxious school-girls who had found help in her simple domestic or religious poems, while her depths of passion would only have frightened them, and they would have listened bewildered to those sonnets which Emerson carried in his pocket-book and pulled out to show his friends. No, there was always a portion of her literature itself which had as essentially a moral motive as had "Ramona"; and, besides, she had always been ready to throw aside her writing and devote whole days, in her impulsive way, to some generous task. For instance, she once, at the risk of great unpopularity, invoked the aid of the city solicitor and half the physicians in Newport to investigate the case of a poor boy who was being, as she believed, starved to death, and whom the investigation came too late to save.

Nor was the Indian question the first reform that had set her thinking, although she was by temperament fastidious, and therefore conservative. On the great slavery question she had always, I suspect, taken regular-army views; she liked to have colored people about

her as servants, but was disposed to resent anything like equality; yet she went with me to a jubilee meeting of the colored people of Newport, after emancipation, and came away full of enthusiasm and sympathy, with much contrition as to things she had previously said and done. She demurred at her Newport hostess's receiving a highly educated young quadroon lady as a temporary boarder in the house, but when the matter was finally compromised by her coming to tea, Mrs. Hunt lavished kindnesses upon her, invited her to her private parlor, and won her heart. The same mixture of prejudice and generosity marked her course in matters relating to the advancement of her own sex. Professedly abhorring woman suffrage, she went with me to a convention on that subject in New York, under express contract to write a satirical report in a leading newspaper; but was so instantly won over—as many another has been—by the sweet voice of Lucy Stone, that she defaulted as a correspondent, saying to me, "Do you suppose I ever could write against anything which that woman wishes to have done?" Afterwards she hospitably entertained the same lecturer when on the canvass in Colorado; and a few months before her death she gave an English advocate of the cause a letter to one of her Eastern friends, saying that her old prejudices were somewhat shaken. A California friend states, indeed, that she sometimes felt moved to write something on the legal and other disabilities of women.

But if other reforms had touched her a little, they had never controlled or held her, until the especial interest in the Poncas arose. After that she took up work in earnest, studied the facts, corresponded with statesmen, and finally wrote her "Century of Dishonor," as has been said. Over this she fairly worked herself sick, and was forced to go to Norway for refreshment with her friends the Horsfords, leaving the proof-reading to be done by a literary ally. Several charming memorials of this trip appeared in the magazines. She afterwards received an appointment from the United States Government to report on the condition and needs of the California "Mission Indians," in connection with Abbott Kinney, Esq.; and she visited all or most of those tribes for this purpose, in the spring of 1883. The report of the commissioners, which is understood to have been mainly prepared by her, is as clear, as full, and as sensible as if it had been written by the most prosaic of mankind. She also explored the history of the early Spanish missions, whose story of enthusiasm and picturesqueness won her heart; and she wrote the series of papers in regard to these missions which appeared in this magazine.

During this whole period, moreover, she did not neglect her earlier productions, but gathered them into volumes; publishing "Bits of Talk for Young Folks" (1876) and "Bits of Travel at Home" (1878). She also issued separately (1879) a single poem, "The Story of Boon." This was founded on a tale told in "The English Governess at the Siamese Court," by Mrs. A. H. Leonowens, a lady whose enthusiasm and eloquence found ardent sympathy in Mrs. Hunt, who for her sake laid down her strong hostility to women's appearance on the platform, and zealously organized two lectures for her friend. She published also a little book of her mother's, "Letters from a Cat" (1880), and followed it up by "Mammy Tittleback's Stories" (1881), of her own; and "The Hunter of Cats of Connorloa" (1884). Another book, for rather older children, was "Nelly's Silver Mine" (1878), and she wrote a little book called "The Training of Children" (1882). Then came "Ramona," first published in the "Christian Union" in 1884, appearing there because it had been written, as it were, at a white heat, and she could not wait for the longer delays of a magazine. It was issued in book form that same year, and completes the list of her acknowledged works. It was no secret, however, that she wrote, in the "No Name" series, "Mercy Philbrick's Choice" (1876) and "Hetty's Strange History" (1877). Into the question of other works that may have been rightly or wrongly attributed to her, the present writer does not propose to enter.

The sad story of her last illness need not here be recapitulated. She seemed the victim of a series of misfortunes, beginning with the long confinement incident to a severe fracture of the leg in June, 1884, this being followed by her transfer to a malarious residence in California, and at last by the discovery of a concealed cancerous affection that had baffled her physicians and herself. During all this period—much of it spent alone, with only a hired attendant, far from all old friends, though she was cheered by the constant kindness of newer ones—her sunny elasticity never failed; and within a fortnight of her death she wrote long letters, in a clear and vigorous hand, expressing only cheerful hopes for the future, whether she should live or die. One of the last of these was to President Cleveland, to thank him for sustaining the rights of the Indians. Her husband, who had been imperatively detained in Colorado by important business, was with her at the last, and she passed away quietly but unconsciously, on the afternoon of August 12, 1885. A temporary interment took place in San Francisco, the services being performed by the Rev. Horatio Stebbins, who read, very appropriately, the "Last

Words," with which her little volume of verses ends. It was the precise memorial she would have desired; and the burial-place assigned to her was also in accordance with her own expressed wishes—it being a spot near the summit of the Cheyenne Mountains, about four miles from Colorado Springs.

IV.

THE poetry of Mrs. Jackson unquestionably takes rank above that of any American woman, and in the opinion of many above that of any Englishwoman but Mrs. Browning. Emerson, as is well known, rated it above that of almost all American men. Her works include, first, the simple poetry of domestic life; secondly, love-poems of extraordinary intensity and imaginative fullness; thirdly, verses showing most intimate sympathy with external nature; and lastly, a few poems of the highest dignity and melody in the nature of odes, such as "A Christmas Symphony" and "A Funeral March." The poem which combines the most of depth and the most of popular sympathy is that called "Spinning," where a symbol drawn from common life assumes the sort of solemn expressiveness that belongs to the humble actions of peasants in the pictures of the French Millet. Emerson's favorite was her sonnet called "Thought"; and other critics have given the palm for exquisiteness of musical structure to her "Gondolies." But her poetry was only a small portion of her literary work; and of the range and value of this product, a good conception will be given when we say that a plan was at one time seriously formed by the late Dr. Holland and his associate in charge of this magazine, to let Mrs. Jackson's contributions accumulate sufficiently to fill one number of the periodical — poetry, fiction, travels, criticism, and all — and then send it all forth as the product of one person. The plan was finally dismissed, as I am assured, not from the slightest doubt of its practicability, but only because it might be viewed as sensational. It is probably the greatest compliment ever yet paid by editors, in the whole history of magazine literature, to the resources of a single contributor.

There is in her prose writings an even excellence of execution which is not always to be found in her poetry, and which is surpassed by hardly any American writer. It is always clear, strong, accurate, spirited, and forcible; she had a natural instinct for literary structure, as well as style, and a positive genius for giving characteristic and piquant titles to what she wrote. It was her delight not merely to explore the new, but to throw

novel and unexpected freshness around the old. Before she had become so wide a traveler she used to plan a book, to be called "Explorations" or some such title, in which all the most familiar scenery was to be described under fictitious names; and only the map appended would gradually reveal, through its new local phraseology, that "Hide and Seek Town" * was Princeton, Massachusetts, and so on indefinitely. Her poetry sometimes offered deeper enigmas than these superficial ones, and some of the best of it will never be fully comprehended but by the few who had the key to the events or emotions that called it forth. So ardent were her sympathies that everything took color from her personal ties; and her readiness to form these ties with persons of all ages, both sexes, and every condition not only afforded some of her greatest joys, but also brought the greatest perils of her life; often involving misconception, perplexity, and keen disappointment to herself and others. Her friendships with men had the frankness and openness that most women show only to one another; and her friendships with women had the romance and ideal atmosphere that her sex usually reserves for men. There was an utterly exotic and even tropical side of her nature, strangely mingled with the traits that came from her New England blood. Where her sympathy went, even in the least degree, there she was ready to give all she had,—attention, time, trouble, money, popularity, reputation,—and this with only too little thought of the morrow. The result was found not merely in many unreasonable requests, but in inconvenient and unlooked-for expectations. During the middle period of her life there was never any security that the morning postman might not bring an impassioned letter from some enamored young girl, proposing to come and spend her life with her benefactress; or a proffer of hand and heart from some worthy man, with whom she had mistakenly supposed herself to be on a footing of the plainest good-fellowship. It sometimes taxed all her great resources of kindness and ready wit to extract herself from such entanglements; and she never could be made to understand how they had come about or why others succeeded them.

She had great virtues, marked inconsistencies, and plenty of fascinating faults that came near to virtues. She was never selfishly ungenerous, but she was impulsive in her scorn of mean actions, and was sometimes cruelly unjust to those whom she simply did not understand; this misconception very often occurring, however, in the too Quixotic defense of a friend or a principle. To those

* See this magazine for August, 1876.

who knew her best she was a person quite unique and utterly inexhaustible; and though her remoteness of residence during the last ten years had separated her from the society of many of her earlier friends, there is not one of them who does not feel the world deeply impoverished by her going out of it. She did not belong to a class; she left behind her no second; and neither memory nor fancy can restore her as she was, or fully reproduce,

even for those who knew her best, that ardent and joyous personality. And those who recall her chiefly in gayer moods will find their remembrance chastened by the thought that she could write, when finally face to face with death, such poems as "Habeas Corpus," "Acquainted with Grief," and "A Last Prayer,"—poems which are here first published, and which add a new dignity to the falling away of the flesh and a new nobleness to human nature.

THE LAST POEMS OF HELEN JACKSON (H. H.).

ACQUAINTED WITH GRIEF.

DOST know Grief well? Hast known her long?

So long, that not with gift or smile,
Or gliding footstep in the throng,
She can deceive thee by her guile?

So long, that with unflinching eyes
Thou smilest to thyself apart,
To watch each flimsy, fresh disguise
She plans to stab anew thy heart?

So long, thou barrest up no door
To stay the coming of her feet?
So long, thou answerest no more,
Lest in her ear thy cry be sweet?

Dost know the voice in which she says,
"No more henceforth our paths divide;
In loneliest nights, in crowded days,
I am forever by thy side?"

Then dost thou know, perchance, the spell
The gods laid on her at her birth,—
The viewless gods who mingle well
Strange love and hate of us on earth.

Weapon and time, the hour, the place,
All these are hers to take, to choose,
To give us neither rest nor grace,
Not one heart-throb to miss or lose.

All these are hers; yet stands she, slave,
Helpless before our one behest:
The gods, that we be shamed not, gave,
And locked the secret in our breast.

She to the gazing world must bear
Our crowns of triumph, if we bid;
Loyal and mute, our colors wear,
Sign of her own forever hid.

Smile to our smile, song to our song,
With songs and smiles our roses fling,
Till men turn round in every throng,
To note such joyous pleasuring,

And ask, next morn, with eyes that lend
A fervor to the words they say,
"What is her name, that radiant friend
Who walked beside you yesterday?"
July 1st.

FEALTY.

THE thing I count and hold as fealty,
The only fealty to give or take,
Doth never reckoning keep, and coldly make
Bond to itself with this or that to be
Content as wage; the wage unpaid, to free
Its hand from service, and its love forsake,
Its faith cast off, as one from dreams might wake
At morn, and smiling watch the vision flee.
Such fealty is treason in disguise.
Who trusts it, his death-warrant sealed doth
bear.

Love looks at it with angry, wondering eyes;
Love knows the face true fealty doth wear,
The pulse that beats unchanged by alien air,
Or hurts, or crimes, until the loved one dies.

VISION.

By subtle secrets of discovered law
Men well have measured the horizon's round,
Kept record of the speed of light and sound,
Have close defined by reasoning without flaw
The utmost human vision ever saw
Unaided, and have arrant sought and found
Devices countless to extend its bound.
Bootless their secrets all! My eyes but stray
To eastward, and majestic, bright, arise
Peaks of a range which three days distant lies!
And of the faces, too, that light my day
Most clear, one is a continent away,
The other shines above the farthest skies!

THE POET'S FORGE.

HE lies on his back, the idling smith,
A lazy, dreaming fellow is he;
The sky is blue, or the sky is gray,
He lies on his back the livelong day;
Not a tool in sight; say what they may,
A curious sort of a smith is he.

The powers of the air are in league with him;
 The country around believes it well;
 The wondering folk draw spying near;
 Never sight nor sound do they see or hear;
 No wonder they feel a little fear;
 When is it his work is done so well?

Never sight nor sound to see or hear;
 The powers of the air are in league with him;
 High over his head his metals swing,
 Fine gold and silver to shame the king;
 We might distinguish their glittering,
 If once we could get in league with him.

High over his head his metals swing;
 He hammers them idly year by year,
 Hammers and chuckles a low refrain:
 "A bench and book are a ball and chain,
 The adze is better tool than the plane;
 What's the odds between now and next
 year!"

Hammers and chuckles his low refrain,
 A lazy, dreaming fellow is he:
 When sudden, some day, his bells peal out,
 And men, at the sound, for gladness shout;
 He laughs and asks what it's all about;
 Oh, a curious sort of smith is he!
 July 12th.

VANITY OF VANITIES.

BEE to the blossom, moth to the flame;
 Each to his passion; what's in a name!

Red clover's sweetest, well the bee knows;
 No bee can suck it; lonely it blows.

Deep lies its honey, out of reach, deep;
 What use in honey hidden to keep?

Robbed in the autumn, starving for bread;
 Who stops to pity a honey-bee dead?

Star-flames are brightest, blazing the skies;
 Only a hand's breadth the moth-wing flies.

Fooled with a candle, scorched with a breath;
 Poor little miller, a tawdry death!

Life is a honey, life is a flame;
 Each to his passion; what's in a name?

Swinging and circling, face to the sun,
 Brief little planet, how it doth run!

Bee-time and moth-time, add the amount;
 White heat and honey, who keeps the count?

Gone some fine evening, a spark out-tost!
 The world no darker for one star lost!

Bee to the blossom, moth to the flame;
 Each to his passion; what's in a name

HABEAS CORPUS.

My body, eh? Friend Death, how now?
 Why all this tedious pomp of writ?
 Thou hast reclaimed it sure and slow
 For half a century, bit by bit.

In faith thou knowest more to-day
 Than I do where it can be found!
 This shriveled lump of suffering clay,
 To which I now am chained and bound,

Has not of kith or kin a trace
 To the good body once I bore;
 Look at this shrunken, ghastly face:
 Didst ever see that face before?

Ah, well, friend Death, good friend thou art;
 Thy only fault thy lagging gait,
 Mistaken pity in thy heart
 For timorous ones that bid thee wait.

Do quickly all thou hast to do,
 Nor I nor mine will hindrance make;
 I shall be free when thou art through;
 I grudge thee nought that thou must take!

Stay! I have lied; I grudge thee one,
 Yes, two I grudge thee at this last,—
 Two members which have faithful done
 My will and bidding in the past.

I grudge thee this right hand of mine,
 I grudge thee this quick-beating heart;
 They never gave me coward sign,
 Nor played me once a traitor's part.

I see now why in olden days
 Men in barbaric love or hate
 Nailed enemies' hands at wild crossways,
 Shrined leaders' hearts in costly state:

The symbol, sign, and instrument
 Of each soul's purpose, passion, strife,
 Of fires in which are poured and spent
 Their all of love, their all of life.

O feeble, mighty human hand!
 O fragile, dauntless human heart!
 The universe holds nothing planned
 With such sublime, transcendent art!

Yes, Death, I own I grudge thee mine
 Poor little hand, so feeble now;
 Its wrinkled palm, its altered line,
 Its veins so pallid and so slow—

. . . (Unfinished here.)

Ah, well, friend Death, good friend thou art;
 I shall be free when thou art through.
 Take all there is—take hand and heart;
 There must be somewhere work to do.
 August 7th.

A LAST PRAYER.

FATHER, I scarcely dare to pray,
 So clear I see, now it is done,
 That I have wasted half my day,
 And left my work but just begun;

So clear I see that things I thought
 Were right or harmless were a sin;
 So clear I see that I have sought,
 Unconscious, selfish aims to win;

So clear I see that I have hurt
 The souls I might have helped to save,
 That I have slothful been, inert,
 Deaf to the calls thy leaders gave.

In outskirts of thy kingdoms vast,
 Father, the humblest spot give me;
 Set me the lowliest task thou hast,
 Let me repentant work for thee!

August 8th.

THE LESSON OF GREEK ART.*

PART I. THE EDUCATION OF THE PEOPLE.

THE very difficulty which we must feel in expressing by means of words the chief artistic characteristics of the works of Greek art points to one of the cardinal virtues inherent in it, namely, its simplicity.

The works were meant to be gazed upon, and not to be the subject of learned commentaries; they were intelligible to the people, appealed to their senses, their feelings, their moral and intellectual nature, by means of their own substance and form, without the need of a verbal explanation. But the remains are comparatively scanty and in a fragmentary condition, and therefore require instruction and study in order to be appreciated. Furthermore, they belong to an age removed from us by more than two thousand years, to a people differing from us in the natural, social, and religious conditions of life; and thus it is not only from the purely artistic, but especially from the historical point of view that we must regard them. Here it is that art becomes perhaps the chief, at least one of the most important means of apprehending and realizing the civilization of ancient Hellas.

Still, we must never forget that art to the Greeks was a great reality; that it was a part of their daily life, covering and affecting their smallest, humblest needs, as it was evoked by and expressed their highest aspirations. And, above all, the modern student must remember that the works were not meant to be stowed away in museums, by which most of us mean repositories of curious, outlandish, and fractured articles, of all out-of-the-way things that have nothing to do with the needs of daily life, and from the contemplation of which we return with the sense of having done

something uncommon, almost amounting to a moral penance which is followed by a stern but pleasant self-approval.

Art with the Greeks was above all the outcome of a real need felt among the people, as it was at the same time the means of conveying to the whole public the most unalloyed and edifying pleasure. It was to the people a really intelligible language which conveyed to them in its impressive form the highest fruits of the culture of their time. And this it is which makes the position of Greek art so unique in the history of the world's civilization: the fact that, on the one hand, it was the adequate expression of the very best that the intellectual life of the people could offer, the highest and deepest of their thought; and that, on the other hand, its expressions were intelligible to the lowliest and humblest of Greek citizens. I will refer you to but one well-known instance in illustration of this fact: In the eastern pediment of the Parthenon Pheidias represented in the forms of mythology, in the most sensuous and easily intelligible form, one of the widest conceptions of cosmogony. The birth of Athene out of the head of Zeus is the cosmical conception of the birth of the clear atmosphere out of the depths of heaven. The clear-eyed daughter of Zeus is born on the heights of Olympus, in the presence of the gods, surrounded by the broadest personifications of nature. The scene is bounded at the one angle of the pediment by the rising sun-god, Helios, with his chariot, and at the other angle by the moon-goddess, Selene, descending into the regions of darkness with her steeds. We here have the widest metaphysical conceptions, Time and Space incorporate. And, moreover, they are put in such a form that these widest conceptions were intelligible and appealed to the most childlike of

* The essay here printed was originally delivered as a lecture at Chickering Hall, New York, January 29, 1884. It has been revised and amplified for publication here.—EDITOR.

minds among the Greek citizens.* The questions must present themselves to us: How came Greek art to be possessed of these attributes? And can this state of art be reproduced? As regards the second of these questions, most people answer hastily, "No, the time has gone by; that age will never again return," as if there were some mysterious essence underlying the growth and flower of Hellenic culture. But if we study the main conditions which led to this peculiar growth of Greek art, we may find that these conditions are to a certain degree reproducible; nay, that there is always something abnormal and wrong in the social constitution of a civilized community when the conditions are not similar.

The conditions which made Greek art intelligible to the mass of the population and adequately expressive of the highest culture of the age are above all to be found (1) in the education of the art-appreciating public, and (2) in the education of the productive artist.

In the first place, the chief characteristic of Greek popular education was, that it above all meant to produce men who were mentally as well as physically fully and normally developed on all sides of their nature. It is the roundness and versatility of the types of Greek social and political history which most strike us who belong to an age of over-specialization. A political leader like Pericles was at the same time a skilled soldier with full athletic training, a keen student of philosophy and of literature, and a votary of the highest art. A dreaming philosopher like Socrates was keenly alive to the political questions of his time, and, as a brave and hardy soldier, took part in the warlike expeditions of his country. As in the *Palæstra* the normally and fully developed human body was held up as the aim of physical education, and the defective growth of any one member was remedied by a series of athletic exercises; so the *musical* side, the intellectual training, and the full and normal development of the human mind on all sides was the supreme aim, and any deficiency in power or taste was vigorously counteracted.

But the chief distinctive feature of Greek education must be referred back to the distinctive Greek conception of the life for which this education was to prepare. Aristotle distinguishes two main aspects of the human soul: the active, laboring soul (*νοῦς ποιητικὸς*), and the passive, enjoying soul (*νοῦς παθητικὸς*).

* Some readers may here object that the many theories which exist concerning the interpretation of this very work tend to prove the opposite of the simplicity which I claim for Greek art. I need but remind them that the interpretation of the whole scene and of Helios and Selene are beyond dispute, and that the differences which exist with regard to the meaning of

Education was not only to prepare for the life which consists in the material struggle for existence; but life to the Greeks had another half of equal importance with and practical bearing upon the material subsistence of the individual: it is the life of intellectual relaxation and enjoyment. Food was here to be provided to satisfy the moral and intellectual appetites of rational beings, in a manner most conducive to the moral health and vigor of the individual citizen and the people as a whole. Education was thus not only elementary or technical in character, but set itself the immediate aim of bestowing upon the fully-grown youth a fund of interests and appreciative power which would restore to its normal condition the mind strained in one direction during the hours of toil, and would furnish with interest old age when toil was no longer possible.

Finally, public feeling in Greece was so real a power that it drove the Greeks to demand and to create those forms of enjoyment that are essentially public in themselves, namely, the great works of art. It was not only the imminent danger of the advancing Persian foe which drove the citizens of Athens to concerted action, but after the war was over they joined with the same vigor and public-spirited eagerness not only to rebuild their needed homes, but to adorn them with the greatest works of art the world has ever seen; for art was to them a real need, as it responds to one side of human nature and life which remains the same throughout all ages.

In the second place, the education of the productive artists was equally characterized by this roundness and versatility of interest and training. They were not only carefully educated in the technical manipulation of their art, so that they could express with facility and clearness of form whatever they desired to express, but their education, even after the period that we should call school-days, as well as their intercourse with men of varied interests, were such as to make them conversant and in sympathy with all the varied intellectual interests and pursuits of their age. The artist as a man stood on the highest scale of the intellectual culture of his age. As a man he was the highest type of the civilized Greek; while as an artist he had the power to express clearly, in the sensuous language of his art, the high culture of which he himself was a living type. That Pheidias had

the figures are caused by the fact that the arms holding the distinct attributes are all lost. A Greek child would recognize a male figure holding the thunderbolt as Zeus, a reclining female with fruits or corn as Demeter, or one with sea-animals as Thalassa. For further information on this subject I must refer the reader to Essay V. in my work on the art of Pheidias.

political interests, that in daily intercourse with Pericles he shared with him the anxiety of overcoming political crises, that he was well read in the ancient and contemporary literature of his country, that he was a student of philosophy and of mechanical science, made him no less careful a student of the human form, no less skillful a modeler and draughtsman, though it made him more adequately an exponent of the highest that was in his age.

Such were the conditions which made Greek art the clear and intelligible expression of the highest culture of that great age and people.

Human nature and the needs of human life have remained the same as they were in ancient Hellas, yet the expression of one side of human nature and the satisfaction of one need of human life are not the same. The best art is not clearly intelligible to the lowliest and most childlike of modern citizens; and our best art is not fully and adequately expressive of the highest culture that our age has produced. Why should this be? Some thoughtful people say that it is necessary. Historical evolution, they say, made the Greeks a great artistic people, and us not. We have developed in the direction of science which requires an attitude of mind opposed to the artistic spirit, and the more we have grown in the one the less can we grow in the other. It appears to me that out of the doctrine of evolution, so fruitful in advancing the sphere of human knowledge, there has grown an ex-crescence of historical generalization as vicious as it is faulty and readily accepted. And this becomes still more vicious when the study of the past is used to regulate action in the future. I would call it Fatalistic Evolutionism. The dictum of such a hasty social philosopher would run thus: "The Greeks were the great artistic people; natural and social evolution have made us the great scientific and *therefore* unartistic people; it is necessary that it should be so." There are many scientific errors in this reasoning; such is the oversight of the fact that the Greeks in their time were as scientific, that they expressed as fully the intellectual, cognitive side of their spirit, as they were artistic, and manifested the emotional, creative side of their genius. But among these fallacies the most interesting is the implied analogy between the life of one individual man and the life of a nation; another is the misconception of the nature of the individual human mind, its needs and functions. Because the individual man is limited in the exercise of his intellectual functions by time and physical power, the diffusion of his interests and attention over many things is to a certain extent at the expense of the power directed

towards the consummation of one definite end. Still we must not forget that, as the human body is an organism, so the human mind is organic in its constitution; that, as such, the existence of the whole depends upon the proper and normal relation of all the organs and parts to one another; and that, though definite outer demands in the conditions of life may require a greater development of one organ, still the body and the mind, as a whole, will cease to exist and act if the proper relation of the parts to one another is fundamentally disturbed. Specialization has its limits so long as an organism is not a mechanism, as "*l'homme machine*" is nothing more than an exaggerated epigram. If this is the case even in the individual mind, it is still more the case in so complex an organism as a community, a state, or an age. The chief characteristic of the life of a whole people is its variety and change, and in a large community there is no fear of the same limitation of function and physical power; for its constituent units are so numerous and varied in their individuality that, if the conditions are properly regulated, full and normal expression will be found for the cultured life of the people on every side. In such a healthy community we shall meet with the proper expression of the immediate needs of the whole people for security and facility of intercourse; the full expression of the highest intellectual life of the people in the sphere of pure intellect and thought in science; and the adequate expression of the highest culture of the people in the direction of public enjoyment and the more emotional life of art. I should not like to overshoot the mark and state boldly that the great man is great all round; for history has given instances apparently showing that great specialists may be imperfectly developed or educated in directions not peculiarly their own; but I do not hesitate to say that a great age and a great people are great in all spheres, unless there be peculiar causes for some weakness either positively pernicious or positively inert. Because we are a great scientific age, we ought *therefore* also to be great in artistic creation; for it is the greatness and spiritual vitality of the age as a whole which show themselves in this one aspect.

Now, while the conditions of modern life have been favorable to the adequate expression of the highest intellectual culture in various directions, they have not been so in art. The study of the conditions which gave Greek art its chief characteristics will enable us to see where the weak points lie, and with concerted action on our part a good deal may in time be remedied. It is not in the spirit of fault-finding that I would point to

our weaknesses, but it is because I have the full faith that much may be done, and will be done, to remedy the evils, and moreover because I would fain believe that, from the indications of the present and the promise of the future, it is to the American Republic that this task is given.

The reasons which make it appear probable that to this country may belong this vocation will partly become evident as we proceed with this investigation. I may here briefly enumerate them as follows: Because we are comparatively unhampered by existing traditions and institutions which might impede the progress of a new or bold step. Because by the nature of our people we are representative of the various currents of culture characterizing European nations, and also by this fact we are predisposed to be historically sympathetic in an age in which historical (I do not mean romantic) feeling is a leading feature. Because, furthermore, we are a people possessed of the most general diffusion of education, in an age when, more than ever (for I maintain that to a certain degree the highest art was always so), great art must be democratic, must rise from the public demand, and must bear in itself the public character. And because, finally (and I consider this of great practical importance), there is in this country no recognized and stereotyped upper class which would lower the social status of the followers of art, and would thus counteract the highest natural selection of the artist from among the most distinguished members of a cultured community.

We differ from the Greeks as regards the artistic expression of the culture of the age in that our highest art is not readily intelligible to the simplest understanding of the modern citizen, and in that, though our age is a great one, we have no "great art," the art that is adequately expressive of the best and highest in us. In minor, especially in what I would call domestic art, we stand very high; but in an age moved by the very widest conceptions of human brotherhood, there ought to be a high art not merely corresponding to the home of the individual citizen and the secluded life of the private mansion, but expressive of the highest moral and intellectual attainments of the age, as our scientific attainments are fully representative of its culture.

We have traced back in the art of Greece the possession of these qualities to the education of the art-appreciating people and the producing artist; we must trace their want in our time to defects in the education of both these classes. We must examine, then, first, the education of the art-appreciating public, and see where its defects lie, and secondly,

the education of the producing artists, and endeavor to discover the weakness in this sphere.

It is the just pride of this nation that more is done here by the government, central and local, for popular education than in any other country, Germany not excepted. The founders of the republic and the devisers of its constitution recognized from the very beginning the fundamental importance of popular education in a republican country, as it is, no doubt, the basis of a well-regulated commonwealth whatever be the actual form of government. And these great men had not in view merely that education which should prove of immediate use to the individual, in assisting him in gaining the means of honest subsistence or the power of reading and writing his voting papers, but they had in view the less apparent, though from the social and political point of view the most important, result of general education in its bearing upon the general welfare of the citizen, and in its tendency to create a high intellectual and moral tradition in the political community as a whole. This was expressed tersely by Washington in his farewell address. "In proportion as the structure of a government gives force to public opinion," he says, "it is essential that the public opinion be enlightened." Now an interesting article by Mr. Charles F. Thwing, in *Harper's Monthly Magazine* (February, 1884), gives ample evidence of the great efforts made in this country for public education; while at the same time it shows how narrow and ill-conceived has been this notion of education, and especially how neglectful it has been of that side which would prepare the public for the appreciation of the highest art, and, by the need created in them for great works, would lead them to act upon the art-producing portion of the community, modifying the character of their work and encouraging their noblest efforts. According to Mr. Thwing, "the total amount by which the general government has aided the several states in education consists of the gift of 125,000 square miles, or about one-thirtieth part of the entire national domain, and of the gift of nearly thirty millions of dollars."

No doubt this proves the keenest appreciation of the value of public education, but it is important to remember that this is only for what must be called primary education, not for the highest education of the university, and still less of art academies. The exception to this rule quoted by Mr. Thwing is most interesting, as manifesting the general spirit which underlies this neglect of higher education. "In 1862 an act was passed donating lands to states and towns for colleges *for the*

benefit of agricultural and mechanical arts."

The limitation of these grants towards higher education to purposes of agricultural and mechanical arts betrays the general tenor of mind actuating not only the majority of our political leaders, but also the vast majority of our thinking population. It is that most ill-conceived and vicious idea of "the practical" and "the useful." Against this watchword of coarse-minded demagogues and conscientious dupes of "experience in the struggle of life" (as misdirected and viciously egotistical in its generalized form and application as it is oftentimes of long standing and dearly bought) all well-disposed reasonable people ought to make war.

In order to gain the moral support of a community for an institution directly or indirectly educational in purpose, it is but necessary to show that it is what is termed practically useful. The whole community will then feel that there is a moral justification in the expenditure, while they consider this justification wanting if the institution can be classed under what might be termed the luxuries of education and civilization. The grounds upon which their sympathy is based and their moral conscientiousness soothed are the following: The utility of any purpose is clearly defined to most people if it can definitely appeal to the personal interest of each individual, or if he can at least conceive of himself as directly benefiting by it. We can all readily conceive of ourselves as gaining a livelihood as joiners, or at least we can appreciate the utility of this vocation from the need we have of its products in the surroundings of our daily life; and thus there would be no doubt in our mind of the decided utility of a school for joiners. But what is here ignored is the fact that in such cases public action is invoked, and that there is a difference between public and private utility. The very nature of public utility, as such, is often that its immediate application to any individual person is vague and more difficult to accomplish. Nay, we may almost put it as a formula, that the more public in character any institution grows, the smaller grows its apparent individual applicability to the use of any individual. The practice of individual doctors is of more apparent and direct utility than the action of a city board of health, and the work of this board of health than that of a national sanitary commission investigating recondite questions of medical science. The action of the one body of individuals directly concerns individuals, and is supported by them; that of the other concerns the public as a whole, and would hardly receive support from individuals, but is maintained by public administration. The practical

utility of the policeman for the promotion of public peace and safety is more easily perceived and demonstrated than is that of the United States Supreme Court, of the postman than of the Postmaster-General; of an elementary village school than of a national university in which are studied and solved the great questions of highest science. But we must here note and insist upon the difference between public and private utility, and remember that in most cases private utility does and ought to stimulate private efforts, while institutions with public utility as their purpose are entirely dependent upon public support. But we find that the public action taken as regards education is the very reverse, and educational institutions the character of whose utility is essentially public (namely, the universities and the art academies) are left to the precarious liberality of individuals and corporations, on the very ground (confessed or implied) that they are not possessed of that utility which is chiefly characterized by its ready application to the individual citizen. It is, however, but fair to point to another ground which often actuates those who oppose the claims to public support of these highest institutions of education, as compared with the claims of the immediately useful schools. It is on the ground of the more generous feeling of democracy, in which the duty of the government is above all conceived as being directed towards the good of the many, and to let the few (who are capable of doing so) look after themselves. But it is against this very vicious circle that we are arguing, concerning which the Greeks teach us the great lesson. We shall see that the very spirit of art is democratic. If it be true that hitherto in our communities the higher education which produces the need of intellectual pleasure and its satisfaction has been restricted to the few, it is this very evil which ought to be remedied, and from the many ought no longer to be withheld their birthright of the faculty of enjoying what is beautiful and true and good. If it were true (which fortunately it is not in our country) that all superior education is restricted to the wealthy few, it is high time, in a republican country, that this be altered. I do not mean to propose the (for the present) impracticable idea that every citizen is to be sent to the university or art academy; but the spirit of which these institutions are the embodiment must be made a reality, a recognized tradition; its public utility must be acknowledged; its fruits must respond, as was the case with the Greeks, to a real need of daily life, of which an admixture is to be infiltrated from the earliest educational years into the system of every boy and girl. But

this is not the case with the spirit of our public schools; nay, even the many rich people among us do not avail themselves of the existing means of giving their sons and daughters the opportunities of acquiring the highest fruits of civilization, in sending them to universities, bestowing an enlightened and refined taste upon those who will have the material opportunities for encouraging the higher art-production, in beautifying their homes, and in showing their public spirit and liberality in the munificent donations which have distinguished our countrymen.

That art is aristocratic in contradistinction to democratic is fundamentally untrue, from whatever side we view it: *a priori* in its inner meaning, and historically as regards the facts of art history. Art is, and has been in its splendid periods, essentially democratic; that is, it has appealed to larger masses of people in contradistinction to individuals. Kant and Schiller have drawn the true distinction between ordinary pleasures and the pleasures of art; the first are selfish, the others are public. The ordinary, selfish pleasures depend upon possession or consumption by one person or one group of individuals; the æsthetic pleasures are those of contemplation or of sympathy common to many. An apple is eaten by one person or a horse possessed by him, and the possibility of some other person enjoying the fruit or using the horse is thereby debarred. The acquisition of these pleasures by any individual is potentially always at the cost of the possession of the same pleasure by some other person. In æsthetic pleasures it is not so. The monumentality of a great edifice, the beauty of a picture, the nobility of a statue, the harmony of a musical composition, the thrilling interest of a drama, and the charm of a book are not diminished in their virtue by the fact that a large number of people enjoy them. On the contrary, we might almost say that they gain in virtue, that they receive the "soul" of their existence through being admired and enjoyed. A building hidden from view, a picture unseen, a statue veiled, a drama unperformed, a book unpublished or not read, are robbed of the soul of their æsthetic existence. Of course there are good souls and bad souls, and it is well that the latter should not live. The whole essence of art is its public, unselfish character, as its pleasures are disinterested and free from the grasping voracity of selfish possession, and it is thus essentially democratic in spirit.

Historically, too, the democratic character of art has ever manifested itself. The periods in history which are marked by the artistic development are also marked by the spread of appreciation among the people, and repub-

lican forms of government. Even if these republics were aristocratic in their constitution, the fact remains that the mass of the population in these periods and countries were thoroughly responsive to the higher artistic delights; nay, that they demanded them as a real need. There exists a common notion, as widespread as it is fallacious, that the splendid growth of art was peculiar to the reign of enlightened tyrants and languished under more democratic forms. This is so neither during the highest period of Greek art nor in the history of mediæval and renaissance art. With regard to Greece, what we have already said confirms the established fact that art was the popular expression of the genius of a people to whom it appealed strongly as a clear and intelligible language. In its highest period, as well as in the period of transition to this perfection, Greece was republican. It is true that in Greece, as well as in the Italian renaissance, individual rulers and usurpers, such as Alexander the Great, Attalus of Pergamon, the Medici, and the Popes, were liberal patrons of art, giving it especially a character of splendor. But this only means that these tyrants and rulers found in the composition of the people over whom they ruled or had just succeeded in gaining sway the existence of art and the need of its works, and that they felt driven by interest or inclination to increase or maintain this pursuit and to satisfy this popular demand. Art had reached its highest point in Greece more than a century before the rule of Alexander the Great, and the great artists, like Skopas, Praxiteles, and even Lysippus, were bred and inspired in the generation preceding him. The Pergamene and Rhodian period marks the decline of Greek art, and the splendor which princes like Attalus and Eumenes infused into it was a futile attempt consciously to reproduce the past culture of Greece proper.

In mediæval and renaissance history the same facts present themselves. In the North it is a free town like Nuremberg, with its guilds and craftsmen, that produces the highest art. Never were art and literature more thoroughly popular than in the springtide of prosperity at Nuremberg. In Flanders, at Ghent, Antwerp, and Bruges, art had the same homely and popular character; and though Bruges became the home of emperors and their court, it was in the merchant community that the princes found the means of satisfying their need for splendor and luxury. It must be remembered that the noblest order of the Golden Fleece is originally symbolical of the commercial prosperity of this market of textile fabrics. And when we come to the South to Italy, we must not forget that it was

in the *cinque cento* that began the spread of art in Italy, not with the Popes nor with the Medici, but that it was already a part of the mental condition of every Italian city long before this period, and had produced works of stupendous importance. As early as the thirteenth century we have the popular spread of the fruits of culture in Italy. Each city of any importance was anxious to possess a university. Beginning with Bologna and Modena in the twelfth century, follow Vicenza, Padua, Naples, Arezzo, Treviso, Pisa, Pavia,—in short, all the great free cities. At this early period the whole country was thus checkered with centers of high culture, and from these, immediately through each student of even lowly family, the realization of the existence and the appreciation of higher culture filtered through the whole population, and manifested itself in their desire and finally need for intellectual pleasures. In modern times it is because of this diffusion throughout the whole empire, this decentralization and multiplication, of the highest class of universities in Germany that the country ranks highest in the general spread of intellectual appreciativeness among modern nations. And the thirteenth century universities in Italy were well attended; and though at the more famous ones there were many foreign students, they were no doubt largely recruited from Italy. The University of Bologna at one time had about ten thousand students, a number never attained by a university of modern times. But even in small towns, where there was no hope of attracting large numbers of foreign students bringing immediate gain to the citizens, we have proof of the same recognition of learning and culture. Thus we hear that the small town of San Gimignano gave a special salary to a learned town clerk who was to give public lectures on civic law; that the same town gave pecuniary help to gifted young men to enable them to study abroad; that they received and honored with a public festival one of their citizens who had gained fame as a professor of law. But this sense for intellectual acquirement on the part of the population itself not only manifested itself in this indirect and passive form, but led them to desire to enjoy its fruits directly,—on the one hand in the lasting monuments of art which beautified their cities, on the other in the more ephemeral form of public festivals. The communalities had the duty of looking after the embellishment of the town, to buy private houses if needed to make a public square, to build palaces for public business and splendid cathedrals, and to erect artistic fountains and monuments. They would even assist with contributions the monasteries or private per-

sons who undertook to build beautiful churches. It is frequently possible to prove in the present day how the example of one city in erecting a fine city-hall or fountain stimulated the neighboring town to erect another which was to surpass it in beauty. The Florentine document of the year 1300 is well known, in which Florence bestows immunity from taxation on Arnolfo, the architect of the baptistery, because she hoped thereby to possess a more beautiful temple than any other town in Tuscany.

The public amusements, illuminations, processions, races, dances, plays, and ingenious conceits of all kinds were recognized by the communities as a real material need of the people, and were therefore provided at public expense; they were considered by them as being useful. The grand notion of "play" as being neither useless nor frivolous marks a truly healthy community. What can be more simple and touching than the account of the festival given by the city of Treviso to which the neighboring towns were invited? The chief feature was the storming of a fortress, defended by the most beautiful ladies and their servants, by noblemen who made war with fruits, flowers, sweetmeats, and perfumes.

This will suffice to show that the growth of art in its highest form in Greece and Italy rose from the ground of a populace educated to and encouraged in the desire for intellectual edification, and that art is thus thoroughly democratic in spirit, and ought to appeal to the mass of the population. It will be so if the public education acknowledges the claim and stimulates the satisfaction of the need.

The whole spirit of modern education must be modified in this respect; that is, it must not be guided by this misconceived notion of "the useful." It is Goethe who said, with epigrammatic exaggeration: "See to the beautiful, the useful will look after itself." It is often most practical to begin with that which is least manifestly useful, especially when it is most in need of support and encouragement; while the manifestly useful is more likely to enforce the satisfaction of its own wants. The German architect Ferstel, who died recently, was in the rare position of seeing the completion, while comparatively young, of an immense cathedral-like church built on subscription. The secret of this singular *practical* success is to be found in the good advice which King Louis of Bavaria gave to the young architect. As he was beginning the *Votiv-Kirche* at Vienna, "Begin with the tower and finish it," said the King in Bavarian dialect; "the others will see to the nave when they can't use the church." Had he not followed this advice, it is almost certain that the beautiful church would, to

the present day and for some time to come, stand with uncompleted tower.

Well, in the organization of public education in this country, so far as public support is concerned, it may be most practical "to begin with the tower and to complete it"; but with a real tower, one existing for its beautiful form and from which there is a view far into distant lands, and not one conceived merely as a buttress to the nave.

We must begin with ordinary school education; and here the action which is to counteract the neglect of popular artistic feeling is to be direct and indirect: direct in the immediate teaching of art-appreciation; indirect in the modification of the spirit of general teaching.

I have said "the direct teaching of art-appreciation," and not art, because I hold that the two things ought to be kept distinctly separate, the distinction, namely, between art-appreciation and art-production,—art-appreciation, which constitutes one side of every normally developed intellectual citizen, and art-production, which constitutes the vocation of but a few. It is the confusion of these two distinctly different modes of viewing art that causes much mischief in our day. The artist labors and studies the causes with which he may produce certain effects, while the spectator is to enjoy the fruits of these labors, to feel the effects rather than to study the causes; nay, the obtrusion of these causes, or rather of the intention and labor which are meant to produce artistic illusion, is at the very cost of this illusion.

This is not the occasion for the exhaustive discussion of this most important point. Suffice it to state that the teaching which I wish to advocate is the teaching of the history of art with a view to the appreciation of artistic works, and not drawing and painting, for it is this side which has been entirely neglected. I do not wish it to be understood that I disfavor the teaching of drawing in schools. On the contrary, I think that to express ourselves with pencil and brush, by means of the representation of things, ought to be a natural and normal part of the power of expression of civilized beings. In modern times we are too prone to believe, and to act in accordance with the belief, that words are the only means of communicating thought. Nay, I go so far as to regret the defection of the old system of "accomplishments"—education for young ladies in one point; namely, that the *purely amateur* spirit of teaching sketching in water-colors or pencil is going out in England. It has given way either to the great multiplication of would-be professional artists who fail to give pleasure to others with their work,

and have left for themselves after their efforts the pain of unattained aims, or to the complete neglect of this delightful guide to the pleasant study and the most complete appreciation of nature, and lasting recorder of beautiful places seen and pleasant days spent. Surely the practice of sketching from nature is as pleasure-bringing and refining as the power of performing on a musical instrument.

But it is the teaching of art-appreciation in schools which must be impressed upon all those concerned with education, in order that with regard to general education we might in a direct way apply the lesson of Greek Art, and be like them in the normal constitution of a healthy civilization, equally developed on all sides. In England there is on foot at the present moment a movement which we sincerely hope will receive widest support. It is the Art for Schools Association, which sets itself the aim of distributing, at the very lowest price, reproductions of works of art to the various schools that ask for them. It required an association of individuals in England, where education is not to so high a degree in the hands of the public administration as is the case in this country with public schools. Still, even there the richly endowed institutions called public schools ought to take the matter into their own hands. Rugby has already set an excellent example in the establishment of a school museum. Harrow, too, has the beginning of one. But generally this side of education is completely neglected. In this country this branch of education ought to be thoroughly organized. Each school ought to be provided with a set of reproductions of the most representative works of art from all periods and countries. Photo-engravings, casts from works of sculpture, nay, even the chromo-lithographs with which the Arundel Society has won a well-deserved fame—these works should adorn the walls of school-rooms, and should accustom the eyes of the children from the earliest age to what is excellent in art, thus watching over and cultivating taste as well as sharpness of reasoning and clearness of intellect. Out of many testimonies to the lasting influence of early contemplation of good art, I will but recall the public testimony recently given by Mr. Lowell to the lasting effect which certain reproductions from the antique had upon him as a child when taken to the Boston Athenæum. But we are not to stop at the selected decoration of school-rooms. Each school is further to be provided with a complete set of reproductions systematically chosen to represent the chief stages in the history of art; and the teachers of history, and literature, and language are to be competent to illustrate

and explain the artistic manifestation of any period they are treating of, or any passages in ancient or modern authors which refer to the works of art under consideration. In the higher classes, finally, there ought to be a definite course of instruction in the history of art, without which no boy or girl ought to pass into the world or enter the university. The subjects just mentioned are not the only ones in connection with which the study of art might well be used to supplement and vitalize knowledge. The study of geography, for instance, as at present conceived, is one of the studies the restricted acceptance of which is a crying evil. It is true that it has been supplemented by physical geography, but it ought also to be supplemented by the study of the history of localities in the widest sense; that is, the knowledge not only of the political events marking the various localities, but also the culture that prevailed there, and the appearance of the country, illustrated by photographs of such places, and of the famous works of art which they contain. The various studies ought to be used to illustrate each other; the connection between the groups of studies is to be insisted upon; they are, in short, to be endowed with their own life as they are to be living in the mind of the student, a part of his own intellectual vitality, and not merely an alien element introduced for the time being under a mechanical process of pressure, and discarded as soon as the pressure is withdrawn.

But this leads us to the question of the indirect modification of the spirit of general teaching which is required in order to remedy the diseased state of the development of art. Expressed or only implied, there is a fear in teachers lest, in giving life, say, to the study of geography, in thus illustrating it by means of pictures and the stories of its men, the study be not made too amusing and interesting to maintain the serious character of work. This is the same spirit which we met before swaying the wand of practical utility. In this case it is the domination of the ethical and moral over the intellectual and artistic. The effect of compulsory learning upon the pupils is no doubt often good in making them realize the idea of duty, and in teaching them to control their inclination towards self-indulgence. But life presents so many occasions for teaching and practicing these moral qualities that they need hardly be multiplied for the young, generally overburdened with the feeling of renunciation and with all that counteracts the spirit of joyousness. At all events, immediate moral discipline is not the chief and direct aim of the pursuit of definite studies, and every means which tends to make

systematic knowledge complete and to infuse it into the mental system of the pupil with greatest power or promise of tenacity is highly commendable. The general tone of school education is, above all, to be altered in its groundwork in this very direction. The teacher is to realize that one noble thing to strive after is the creation in the pupil of lasting interests and the joy of learning and apprehending. The *nous pathéticos* of the Greeks, and not only the *nous poieticos*, is to be watched over and developed. The aim of school-teaching will not only be to fit man and woman best for the active struggle of existence, for the practically useful, but equally to create in them a great capital of interests which will refresh them when wearied with the active struggle, and will give them lasting elevating interests and pleasures when the power of active work has ceased; a capital of interests which do not depend upon possession or consumption, that are open to the rich and the poor, that are in themselves ennobling and strengthening as well as satisfying; in short, the artistic or æsthetic attitude of mind, whether applied to actual works of art or to intellectual and moral pursuits. Let the teacher infuse some of this spirit into whatever subject he teaches. Let him stop and dwell upon the beauty or truth of the passage he is translating, upon the fascination and charm in the history of words, and the graceful fretwork of the huge grammatical structure; let him call back to life the study of the past, and ennoble and mellow the study of the present by showing its systematic interrelation with all things which form the lasting whole of the universe. Surely it will not be to the detriment of the appreciation of truth or the practical application of facts acquired, but it will satisfy another need which is highly practical, inasmuch as it concerns the mental health and happiness of every man. Thus trained in school, the average boy will grow to a man capable of appreciating the best art of his time.

But education does not cease with the boy, and it is in the appreciation of this fact that again in this country we are peculiarly wanting. The capital of interests, once acquired, must be renewed and even increased, or else it will soon die away under the heavy calls from the eager life of interested work. In this country a hard-and-fast line is drawn between the life of play of the boy and the "serious" life of work of the man. A certain amount of toleration exists (though even here too little) towards the more playful thoughts and distractions of the boy at school; but when these years are over, play is to cease and work is to begin, and thereafter the one great and engrossing aim is in some form or other to gain

the means of subsistence, or to increase them as much as possible. All the previous thoughts of play are to be and are at once dismissed.

This is especially the case with athletic games. The boy who wins laurels as a baseball player ceases this healthy amusement the moment he enters the active life of manhood, and leaves the adult playing to professionals. Even in the universities where athletic games are still cultivated there is with us a certain feeling that the student who rows or is prominent in other games is so, to a certain degree, at the expense of his reading habits. In England, I would venture to say, the most distinguished students, the high wranglers and senior classics, are generally, and have been, boating men. From two to four o'clock in the afternoon it is customary in the English universities, not only for students, but also for teachers, to take their outdoor exercise in some form. I have in my mind at this moment a number of gray-haired university teachers at Cambridge, each one of them a distinguished representative of his branch of science, who all indulge in some form of athletic exercise, be it tennis, rackets, fives, rowing, or riding. Of these a large number merely indulge in constitutional walks; but even of these there are few who would not at times take part in some game. There exists at Cambridge a rowing crew called the Ancient Mariners, consisting exclusively of "dons," and the "stroke" is generally a tutor of Trinity Hall who ceased to be an undergraduate forty years ago. A frequent oarsman of this crew was the late professor of political economy and postmaster-general, who, as is well known, despite his arduous duties and the grievous misfortune of blindness, skated and took all forms of horse-exercise. Luckily for England, adult games are not so exclusively in the hands of professionals, and have retained the freshness and charm of their attraction and the noble purpose which they are destined to serve. I dwell upon this matter of the comparative cultivation of athletic games, though at first sight it might appear alien to the main question before us, because their neglect in this country shows the general neglect of the spirit of play, the *nous pathéticos*, struggling for recognition against the all-destroying domination of the spirit of work, the *nous poieticos*. It is at bottom the same spirit of play which underlies the cultivation of art, as with the Greeks it was the same impulse which on the physical side led them to develop so highly their athletic games as on the intellectual side it made them the great artistic nation. Herein we might follow the example of England, especially those who are in the happy position of being able to create

leisure, if only they would desist from considering the acquisition of wealth the one great aim of their existence (would that the means were given to all!). I do not mean the establishment of a "leisure class" of which we hear so much. On the contrary, we are most fortunate in not having a class which distinguishes itself from the remainder of the population in that it is not actually productive and does not take an active position in the great coöperative community. May we never desist from withholding our complete respect from those who have no distinct vocation in life; only let us not consider the less apparently and immediately useful avocations as not being an active coefficient in this coöperative social community. But what we do require is the infusion of leisure into all our working classes, and the recognition of its just and moral claim to our consideration.

To return to the less physical aspect of the power of enjoying. It is here that in this country, especially with men, the same abrupt transition from the preparatory life at school to this serious life of business or profession takes place. The capital of interests and intellectual pleasures is no longer increased, but is slowly consumed, until all thoughts and aspirations are completely absorbed by the wearing cares or eager desires of gain and advancement. How often do we meet with the sad sight of the awkwardness or helplessness of people of fair intellect when circumstances have for the time being prevented them from following the ordinary pursuits of life; they are then deprived of the one object which can still exercise a stimulating influence upon their minds, the influence of which is wearing and not refreshing. And it is still sadder to meet with the frequent instances of people who have arrived at that age when the active vigor required for the ordinary vocations of life has been spent, when the "active mind" can no longer exercise its functions, and the "passive mind" has degenerated from early neglect; to see them either vegetating in comatose selfishness (they who before were active and unselfish), or worrying themselves and others with petulant seeking after something of interest which they fail to find (they who before were cheerful and burning with interest). We have instances of this before our eyes every day in this country.

Then picture to yourself, on the other hand, a retired veteran from the bloodless battle of modern economical life, whose vigor just fails to suffice for business or profession, but leaves him free to follow and then to be refreshed by the intellectual pursuit the germs of which took root in his school-days, and have grown

and budded by the side of the sturdy tree of earnest life-work; until, when the sap no longer suffices to nourish the great tree, life is not yet extinct, for the flower and shrub now bud and give growth and beauty to the whole life as it wanes. When they can no longer go to their office or their work, there remains to them the interest in books, in pictures or bric-à-brac, in prints, in some study of science, in music, the theater, their garden and botany, in shells, or beetles, or butterflies. Above all, they have learnt the art of being alone. The first and most common symptom of intellectual vulgarity, of intellectual anæmia, if I may use the term, is the incapacity of people to remain alone or quiet. They are so poor in the intellectual life-blood that the pulse of interest will not throb unless they have the outer stimulus of the chatter of people. A book, a beautiful scene, not to mention their own thoughts, cannot fascinate them even for an hour, and they must beg for the offal of interest from the social banquet. I hold that to teach people the art of being alone and enjoying it, is of more practical use than the immediate good that comes from much of the most practical school-teaching. And this power of moral enjoyment is not, and ought not to be, restricted to the rich or the well-to-do. It ought to be a popular good, as it was with the Greeks.

It is, moreover, the duty of popular government to foster and cultivate this power among the people, which they can do by means of the encouragement of those pleasures the very nature of which is that they are common and belong to the many, that they increase with the degree of participation; namely, the democratic pleasures of art. Nor do I conceive the term art in the narrow acceptation of painting, and sculpture, and architecture. The art that is to be encouraged by public administration is all that comes under the head of *intellectual play* common to the many and productive of moral edification. Public feasts, music, the drama, museums, libraries, reading-rooms, and the more immediately instructive amusement of lectures,—all these ought to be the great care of state, as they were in ancient Hellas; nay, even more so in a time which has not the restricted notions of national duties requiring the chief energy of the people to guard or to aggrandize their national domain against aliens whom they considered as their enemies, or at least not their friends. I see the day coming when this fact will have grown in the public consciousness until it will come to be realized by the government, that it is the supreme duty of the state to foster and cultivate the higher amusements of

the people more than to play at antiquated Talleyrandism in foreign policy.

How little this is realized at present, especially in Europe, is shown most strikingly in England. Eastern and Egyptian questions are of such absorbing importance that the public care of intellectual pursuits and amusements would naturally appear trivial to most persons concerned with government. A relatively small sum for the acquisition of a work of art or the maintenance of a museum is withheld or granted after much discussion, where millions are devoted unhesitatingly to some object of "foreign policy."

As one of the most curious instances of the neglect, not to say contempt, which this group of public institutions suffers in England, I need but point to the administration of the British Museum. Of all the civil service of which the administration of this museum forms a part, this institution requires in its officers and assistants the greatest previous preparation and initial capital of intelligence; and still its appointments are lowest in the scale of salaries in the civil service. A clerk whose duty it is to add up the salaries of non-commissioned officers, or to copy letters and fill out forms, starts with a higher salary, rises at a higher ratio, and ends with a higher final salary, than an assistant who must catalogue and identify Greek and Oriental coins, who must watch over rare manuscripts, and is responsible for priceless articles of science and art. The principal officers of this greatest institution of the kind in the world, who ought all to be the highest representatives of their study, are paid far less than chief-assistant secretaries in the government offices. And this neglect is in a country where the larger schools and universities are richly endowed by private donations and bequests, and where the museums and libraries have been greatly enriched by the same means; where, in short, the burden is comparatively much smaller than it is in this country or in Germany. But it is encouraging to find that of late there is an awakening to the public duties in this direction, both with regard to school and after-school education of the people. Though not yet the act of the Government, the establishment of the Royal Academy of Music remains a public act. The recent Fisheries, Health, and Inventions exhibitions, with their concerts and promenades, have been made a means towards the cultivation of higher popular amusement.

It is here in America, however, where luckily there is no Eastern or Egyptian question, no oppressive standing army, and where the duty of public action with regard to education has been recognized from the very found-

dation of the Republic, that more ought to be done in the direct intervention of public administration. Entertainments and lectures in the town and city halls, establishment and maintenance of museums, embellishment of towns in every respect,—these are to form an integral part of governmental function. As a rule government grants for artistic purposes are limited to architecture; but after the building is complete, a new sphere of public artistic activity ought to begin. The great sculptors and painters and decorators ought to be called in to make of each city hall, each government or public building, in itself a museum, a representative type of the highest advance in art that the place or period has been able to make. Our national capitol is to a certain degree decorated; but I should be sorry, not to say ashamed, to think that this is all the country can produce of highest art. If it is answered that the great art is wanting, I would but point to the fact that artistic demand will produce supply. I have

on several occasions urged talented artists painting small domestic pictures, or modeling statuettes and reliefs, to try something great and worthy. Their answer has been: "Where can we find a market for our great works? We must work for the house of the well-to-do art patron, and the house will not hold a monumental work." I dare say that some, perhaps most, of these artists would have failed in this "great" work; but others, if only one, might have had the noble soul, the *alma gentile*, awakened, and a genius might have been born to us.

There are two broad classes of artistic works, the domestic and the monumental. The latter class is public in character, and ought either to be in a museum or part of some public building. Domestic art is growing every day and will find its support; it is the monumental art, beyond the reach of the individual (as it ought to be), which must be public property and ought to be encouraged by the representatives of the people.

Charles Waldstein.

BIRD ENEMIES.

HOW surely the birds know their enemies! See how the wrens and robins and blue-birds pursue and scold the cat, while they take little or no notice of the dog! Even the swallow will fight the cat, and, relying too confidently upon its powers of flight, sometimes swoops down so near to its enemy that it is caught by a sudden stroke of the cat's paw. The only case I know of in which our small birds fail to recognize their enemy is furnished by the shrike; apparently the little birds do not know that this modest-colored bird is an assassin. At least I have never seen them scold or molest him, or utter any outcries at his presence, as they usually do at birds of prey. Probably it is because the shrike is a rare visitant, and is not found in this part of the country during the nesting season of our songsters.

But the birds have nearly all found out the trick of the jay, and when he comes sneaking through the trees in May and June in quest of eggs, he is quickly exposed and roundly abused. It is amusing to see the robins hustle him out of the tree which holds their nest. They cry, "Thief, thief!" to the top of their voices as they charge upon him, and the jay retorts in a voice scarcely less complimentary as he makes off.

The jays have their enemies also, and need

to keep an eye on their own eggs. It would be interesting to know if jays ever rob jays, or crows plunder crows; or is there honor among thieves even in the feathered tribes? I suspect the jay is often punished by birds which are otherwise innocent of nest-robbing. One season I found a jay's nest in a small cedar on the side of a wooded ridge. It held five eggs, every one of which had been punctured. Apparently some bird had driven its sharp beak through their shells, with the sole intention of destroying them, for no part of the contents of the eggs had been removed. It looked like a case of revenge; as if some thrush or warbler, whose nest had suffered at the hands of the jays, had watched its opportunity and had in this way retaliated upon its enemies. An egg for an egg. The jays were lingering near, very demure and silent, and probably ready to join a crusade against nest-robbers.

The great bugaboo of the birds is the owl. The owl snatches them from off their roosts at night, and gobbles up their eggs and young in their nests. He is a veritable ogre to them, and his presence fills them with consternation and alarm.

One season, to protect my early cherries, I placed a large stuffed owl amid the branches of the tree. Such a racket as there instantly

began about my grounds is not pleasant to think upon! The orioles and robins fairly "shrieked out their affright." The news instantly spread in every direction, and apparently every bird in town came to see that owl in the cherry-tree, and every bird took a cherry, so that I lost more fruit than if I had left the owl indoors. With craning necks and horrified looks the birds would alight upon the branches, and between their screams would snatch off a cherry, as if the act was some relief to their outraged feelings.

The chirp and chatter of the young of birds which build in concealed or inclosed places, like the woodpeckers, the house wren, the high-hole, the oriole, etc., is in marked contrast to the silence of the fledglings of most birds that build open and exposed nests. The young of the sparrows,—unless the social sparrow be an exception,—warblers, fly-catchers, thrushes, etc., never allow a sound to escape them, and on the alarm note of their parents being heard sit especially close and motionless; while the young of chimney swallows, woodpeckers, and orioles are very noisy. The latter, in their deep pouch, are quite safe from birds of prey, except perhaps the owl. The owl, I suspect, thrusts its leg into the cavities of woodpeckers and into the pocket-like nest of the oriole, and clutches and brings forth the birds in its talons. In one case which I heard of, a screech-owl had thrust its claw into a cavity in a tree, and grasped the head of a red-headed woodpecker; being apparently unable to draw its prey forth, it had thrust its own round head into the hole, and in some way became fixed there, and had thus died with the woodpecker in its talons.

The life of birds is beset with dangers and mishaps of which we know little. One day, in my walk, I came upon a goldfinch with the tip of one wing securely fastened to the feathers of its rump, by what appeared to be the silk of some caterpillar. The bird, though uninjured, was completely crippled, and could not fly a stroke. Its little body was hot and panting in my hand, as I carefully broke the fetter. Then it darted swiftly away with a happy cry. A correspondent writes me that one of his orioles got entangled with a cord while building her nest, and that, though by the aid of a ladder he reached and liberated her, she soon afterward died. He also found a chippie, or social sparrow, suspended from a branch by a horse-hair, beneath a partly finished nest. I heard of a cedar-bird caught and destroyed in the same way, and also of two young blue-birds around whose legs a horse-hair had become so tightly wound that the legs withered up and dropped off. The birds grew just the same, and finally left the

nest with the others. A record of all the accidents and tragedies of bird life for a single season would show many curious incidents. A friend of mine opened his box stove one fall to kindle a fire in it, when he beheld in the black interior the desiccated forms of two blue-birds. The birds had probably taken refuge in the chimney during some cold spring storm, and had come down the pipe to the stove, from whence they were unable to ascend. A peculiarly touching little incident of bird life occurred to a caged female canary. Though unmated, it laid some eggs, and the happy bird was so carried away by her feelings that she would offer food to the eggs, and chatter and twitter, trying, as it seemed, to encourage them to eat! The incident is hardly tragic, neither is it comic.

The first nest-builders in spring, like the first settlers near hostile tribes, suffer the most casualties. A large proportion of the nests of April and May are destroyed; their enemies have been many months without eggs, and their appetites are keen for them. It is a time, too, when other food is scarce, and the crows and squirrels are hard put. But the second nests of June, and still more the nests of July and August, are seldom molested. It is rarely that the nest of the goldfinch or cedar-bird is harried.

Certain birds nest in the vicinity of our houses and outbuildings, or even in and upon them, for protection from their enemies, but they often thus expose themselves to a plague of the most deadly character. I refer to the vermin with which their nests often swarm, and which kill the young before they are fledged. In a state of nature this probably never happens; at least I have never seen or heard of its happening to nests placed in trees or under rocks. It is the curse of civilization falling upon the birds which come too near man. The vermin, or the germ of the vermin, is probably conveyed to the nest in hens' feathers, or in straws and hairs picked up about the barn or hen-house. A robin's nest upon your porch or in your summer-house will occasionally become an intolerable nuisance from the swarms upon swarms of minute vermin with which it is filled. The parent birds stem the tide as long as they can, but are often compelled to leave the young to their terrible fate.

One season a phœbe-bird built on a projecting stone under the eaves of the house, and all appeared to go well till the young were nearly fledged, when the nest suddenly became a bit of purgatory. The birds kept their places in their burning bed till they could hold out no longer, when they leaped forth and fell dead upon the ground.

After a delay of a week or more, during which I imagine the parent birds purified themselves by every means known to them, the couple built another nest a few yards from the first, and proceeded to rear a second brood; but the new nest developed into the same bed of torment that the first did, and the three young birds, nearly ready to fly, perished as they sat within it. The parent birds then left the place as if it had been accursed.

I imagine the smaller birds have an enemy in our native white-footed mouse, though I have not proof enough to convict him. But one season the nest of a chickadee which I was observing was broken up in a position where nothing but a mouse could have reached it. The bird had chosen a cavity in the limb of an apple-tree which stood but a few yards from the house. The cavity was deep, and the entrance to it, which was ten feet from the ground, was small. Barely light enough was admitted, when the sun was in the most favorable position, to enable one to make out the number of eggs, which was six, at the bottom of the dim interior. While one was peering in and trying to get his head out of his own light, the bird would startle him by a queer kind of puffing sound. She would not leave her nest like most birds, but really tried to blow, or scare, the intruder away; and after repeated experiments I could hardly refrain from jerking my head back when that little explosion of sound came up from the dark interior. One night, when incubation was about half finished, the nest was harried. A slight trace of hair or fur at the entrance led me to infer that some small animal was the robber. A weasel might have done it, as they sometimes climb trees, but neither a squirrel nor a rat could have passed the entrance.

Probably few persons have ever suspected the cat-bird of being an egg-sucker; I do not know that she has ever been accused of such a thing, but there is something uncanny and disagreeable about her, which I at once understood when I one day caught her in the very act of going through a nest of eggs.

A pair of the least fly-catchers, the bird which says *chebeque, chebeque*, and is a small edition of the pewee, one season built their nest where I had them for many hours each day under my observation. The nest was a very snug and compact structure placed in the forks of a small maple about twelve feet from the ground. The season before a red squirrel had harried the nest of a wood-thrush in this same tree, and I was apprehensive that he would serve the fly-catchers the same trick; so, as I sat with my book in a summer-house near by, I kept my loaded gun within easy reach. One egg was laid, and the next

morning, as I made my daily inspection of the nest, only a fragment of its empty shell was to be found. This I removed, mentally imprecating the rogue of a red squirrel. The birds were much disturbed by the event, but did not desert the nest as I had feared they would. After much inspection of it and many consultations together, they concluded, it seems, to try again. Two more eggs were laid, when one day I heard the birds utter a sharp cry, and on looking up I saw a cat-bird perched upon the rim of the nest, hastily devouring the eggs. Seizing my gun, her career as an egg-sucker ended then and there.

Then this pair of little fly-catchers did what I had never seen birds do before: they pulled the nest to pieces and rebuilt it in a peach-tree not many rods away, where a brood was successfully reared. The nest was here exposed to the direct rays of the noonday sun; and to shield her young when the heat was greatest, the mother bird would stand above them with wings slightly spread, as other birds have been known to do under like circumstances.

To what extent the cat-bird is a nest-robber I have no evidence, but that feline mew of hers, and that flirting, flexible tail, suggest something not entirely bird-like.

Probably the darkest tragedy of the nest is enacted when a snake plunders it. All birds and animals, so far as I have observed, behave in a peculiar manner toward a snake. They seem to feel something of the same loathing toward it that the human species experience. The bark of a dog when he encounters a snake is different from that which he gives out on any other occasion; it is a mingled note of alarm, inquiry, and disgust.

One day a tragedy was enacted a few yards from where I was sitting with a book; two song-sparrows were trying to defend their nest against a black snake. The curious, interrogating note of a chicken who had suddenly come upon the scene in his walk, first caused me to look up from my reading. There were the sparrows, with wings raised in a way peculiarly expressive of horror and dismay, rushing about a low clump of grass and bushes. Then, looking more closely, I saw the glistening form of the black snake, and the quick movement of his head as he tried to seize the birds. The sparrows darted about and through the grass and weeds, trying to beat the snake off. Their tails and wings were spread, and, panting with the heat and the desperate struggle, they presented a most singular spectacle. They uttered no cry, not a sound escaped them; they were plainly speechless with horror and dismay. Not once did they drop their wings, and the peculiar expression of those

uplifted palms, as it were, I shall never forget. It occurred to me that perhaps here was a case of attempted bird-charming on the part of the snake, so I looked on from behind the fence. The birds charged the snake and harassed him from every side, but were evidently under no spell save that of courage in defending their nest. Every moment or two I could see the head and neck of the serpent make a sweep at the birds, when the one struck at would fall back, and the other would renew the assault from the rear. There appeared to be little danger that the snake could strike and hold one of the birds, though I trembled for them, they were so bold and approached so near to the snake's head. Time and again he sprang at them, but without success. How the poor things panted, and held up their wings appealingly! Then the snake glided off to the near fence, barely escaping the stone which I hurled at him. I found the nest rifled and deranged; whether it had contained eggs or young I know not. The male sparrow had cheered me many a day with his song, and I blamed myself for not having rushed at once to the rescue when the arch enemy was upon him. There is probably little truth in the popular notion that snakes charm birds. The black snake is the most subtle, alert, and devilish of our snakes, and I have never seen him have any but young, helpless birds in his mouth.

We have one parasitical bird, the cow-bird, so called because it walks about amid the grazing cattle and seizes the insects which their heavy tread sets going, which is an enemy of most of the smaller birds. It drops its egg in the nest of the song-sparrow, the social sparrow, the snow-bird, the vireos, and the wood-warblers, and as a rule it is the only egg in the nest that issues successfully. Either the eggs of the rightful owner of the nest are not hatched, or else the young are overridden and overreached by the parasite and perish prematurely. The young of the cow-bird is disproportionately large and aggressive, one might say hoggyish. When disturbed it will clasp the nest and scream and snap its beak threateningly. One hatched out in a song-sparrow's nest which was under my observation, and would soon have overridden and overborne the young sparrow which came out of the shell a few hours later, had I not interfered from time to time and lent the young sparrow a helping hand. Every day I would visit the nest and take him out from under the pot-bellied interloper and place him on top, so that presently he was able to hold his own against his enemy. Both birds became fledged and left the nest about the same time. Whether the race was an even one after that I know not.

When the cow-bird finds two or more eggs in a nest in which it wishes to deposit its own, it will remove one of them. I found a sparrow's nest with two sparrow's eggs and one cow-bird's egg, and another egg lying a foot or so below it on the ground. I replaced the ejected egg, and the next day found it again removed, and another cow-bird's egg in its place; I put it back the second time, when it was again ejected, or destroyed, for I failed to find it anywhere. Very alert and sensitive birds like the warblers often bury the strange egg beneath a second nest built on top of the old.

Among the worst enemies of our birds are the so-called "collectors," men who plunder nests and murder their owners in the name of science. In the majority of cases the motive is a mercenary one; the collector expects to sell these spoils of the groves and orchards. Robbing nests and killing birds becomes a business with him. He goes about it systematically, and becomes an expert in circumventing and slaying our songsters. Every town of any considerable size is infested with one or more of these bird-highwaymen, and every nest in the country round about that the wretches can lay hands on is harried. Their professional term for a nest of eggs is "a clutch," a word that well expresses the work of their grasping, murderous fingers. They clutch and destroy in the germ the life and music of the woodlands. The various natural history journals are mainly organs of communication between these human weasels. They record exploits at nest-robbing and bird-slaying in their columns. One collector tells with gusto how he "worked his way" through an orchard, ransacking every tree, and leaving, as he believed, not one nest behind him. He had better not be caught working his way through my orchard. Another gloats over the number of Connecticut warblers, a rare bird, he killed in one season in Massachusetts. Another tells how a mocking-bird appeared in southern New England and was hunted down by himself and friend, its eggs "clutched," and the bird killed. Who knows how much the bird-lovers of New England lost by that foul deed? The progeny of the birds would probably have returned to Connecticut to breed, and their progeny, or a part of them, the same, till in time the famous Southern songster would have become a regular visitant to New England. In the same journal still another collector describes minutely how he outwitted three humming-birds and captured their nests and eggs,—a clutch he was very proud of. A Massachusetts bird-harrier boasts of his clutch of the eggs of that dainty little warbler, the blue yellow-back. One season he took two

sets, the next five sets, the next four sets, besides some single eggs, and the next season four sets, and says he might have found more had he had more time. One season he took, in about twenty days, three sets from one tree.

Thus are our birds hunted and cut off, and all in the name of science; as if science had not long ago finished with these birds. She has weighed and measured and dissected and described them and their nests and eggs, and

placed them in her cabinet, and the interest of science and of humanity now is that this wholesale nest-robbing cease. I can pardon a man who wishes to make a collection for his own private use, though he will find it much less satisfactory and less valuable than he imagines, but he needs but one bird and one egg of a kind; but the professional nest-robber and skin-collector should be put down, either by legislation or with dogs and shot-guns.

John Burroughs.

FAITH-CURES.

A STUDY IN FIVE CHAPTERS.

A FAITH-CURE is a cure wrought by God in answer to prayer, *without any other means*, such as medicine, surgery, change of climate, or indeed any external or internal remedies.

THE THEORY.

1. ALL sickness is the result of sin. Sin is the cause, sickness the effect. This sin may or may not be that of the individual afflicted. But the race of man being sinful, sickness has invaded the mortal body as a consequence. Hence sin and sickness go together, and the soul and body are indissolubly connected.

2. Christ's Atonement avails for sin and all its consequences. Since sickness is one of these consequences, the Atonement makes complete provision for its cure. In proof of this, reference is made to Isaiah liii. 4, where we read: "Surely he hath borne our griefs, and carried our sorrows." Here the word griefs is rendered "sickness," and this passage, taken in connection with Matt. viii. 17, they claim, establishes the point. Psalm ciii. 3, "Who forgiveth all thine iniquities; who healeth all thy diseases," they claim, is also a proof of the completeness of the Atonement as affecting bodily ills as well as spiritual malady.

3. Spiritual redemption provided by Christ is of no avail unless accepted by the individual needing it. So the ample provision for bodily healing made in the Atonement is of no avail unless appropriated by the individual in an act of faith. Further, as soul-health is sustained only by a continually repeated exercise of faith, so bodily health is to be retained in the same way.

4. Death is one of the effects of sin. Since the Atonement avails for sin and all its consequences, it also can release mortals from

the power of death. In this connection it is fair to say that, so far as we know, the English and American school of faith-healers do not claim this; but Pastor Stockmayer, of the German school, openly takes this position. When asked why all believers still die, he constructs an argument based on the "solidarity which exists between the members of the body of Christ," which prevents the individual believer from rising very much above the average experience and faith of the church. He claims that the average faith of the church of to-day is so low, that while here and there believers rise to the privilege of "faith-healing," they are not yet able to reach the climax of deliverance from death. When the church at large has risen to the height of "faith-healing," then we may expect the vanguard to reach deathless life.

5. In consequence of the above theory of the completeness of Christ's Atonement, as availing for bodily ailments, true faith will refuse to use any other than the divinely appointed way of healing. All remedies, external or internal, are "works," and are not germane to faith. An unwavering faith will discard them all. Here, again, it is fair to say that Doctor Cullis of Boston (himself an M. D.) considers the use of medicinal and surgical means allowable, where the patient has not the requisite faith. The Rev. Mr. Simpson of New York, however, and most of the leaders of the American school, hold that the use of any means other than that of anointing and prayer is sinful, because tainted with unbelief.

THE FALLACY.

1. WE admit that sickness is the result of sin, and death its consummate flower; we also admit that the Atonement of Christ avails for sin and all its consequences.

2. But we do not admit that Christ's Atonement avails for all the consequences of sin in this world. Here lies the fallacy of the school of "faith-healers." Not until after the resurrection can the full redemption of man's body be attained. This is positively taught in the Word. Nor do we find in the Scriptures any evidence that sickness, as one of the consequences of sin, is to be completely conquered this side of the grave.

3. If Christ's Atonement, as claimed, avails for all the consequences of sin in this world, then all evils, such as extreme poverty, accidents, etc., should be overcome, since they, too, are consequences of sin. Yet no "faith-healer" will dare march down the line of his premises to this conclusion.

4. Vaccination prevents small-pox. If remedies are wrong, then they and the temptation to use them come from Satan. Therefore, in this case, we have Satan prompting men to use his evil remedies to overcome the consequences of sin. But if Satan thus cast out Satan, how shall his kingdom stand? But, on the other hand, if vaccination is not from Satan, then it is from God. But if from God, it is wrong not to avail ourselves of a God-given remedy. The same is true of every tested remedy for any bodily ailment. The same, also, is true of any surgical appliances, and even of any changes of climate undertaken for the sake of health. There is no way out of this "small-pox argument," excepting to deny that vaccination prevents small-pox.

5. The analogy (chapter 1, section 3) between spiritual health and bodily soundness is vain and deceitful; for faith is absolutely essential for spiritual healing, but it is not absolutely essential for bodily restoration, as witness thousands of cures of unbelievers. The analogy does not hold.

6. The "solidarity of a corrupt church," in the days of Ahab or of Paul, never prevented Elijah or Paul from the exercise of miraculous power. The church of to-day, taken as a whole, is far purer than that of Ahab's or Paul's day. Therefore, by Pastor Stockmayer's argument, she should work greater works than Elijah or the apostle. But she does not and can not.

BIBLE CURES.

1. WHETHER in the Old or New Testament, they had two uniform characteristics: they were instantaneous and complete. Only one instance can be given where this seems not to have been the case. It is found in Mark viii. 22-26. The first touch of Jesus's hand seems to have restored the sight of the patient only partially, so that he saw "men as

trees walking." The second touch completed the healing. But to all intents and purposes the cure was immediate, and all agree that it was complete. The claims of faith-healers that the cure of the ruler's son was gradual, is not good. The case is given in John iv. 46-54. Here the father's question as to "when he *began* to amend" is claimed as proving that the convalescence was gradual. The answer is simply, "At the seventh hour the fever left him." Now the only other instance where the phrase "the fever left" is used is in Matthew viii. 15. In this case, as soon as the fever left her Peter's mother-in-law arose and began household duties, without any long period of convalescence. The presumption, therefore, in the case of the Ruler's son, is that the healing power of the Master worked in the same way, viz., instantly and completely.

Should any quote the case of the Shunammite's son (2 Kings iv. 33-35) as one of gradual cure, we answer, that even this was practically instantaneous, for the cure was wrought within *minutes*, and not within hours, or even days and weeks, as is so often the case in modern "faith-cures."

2. There are at least two cases of the use of means in the Word: in the Old Testament, that of Hezekiah (see 2 Kings xx. 1, and Isaiah xxxviii. 21-22); in the New Testament, that of Timothy, 1 Timothy v. 23.

3. Paul's estimate of the value of "gifts of healing" was not very exalted. He ranks them as far below "love," as is apparent from his whole discussion of the subject in 1 Corinthians xii and xiii. The Church in Corinth was quarreling about these "gifts," and was forgetting the "graces" of character which are the best fruits of the Spirit. This conduct he rebukes. This wrong relative estimate of the spiritual and the temporal appeared in the seventy when "they returned again with joy, saying, Lord, even the devils are subject unto us." This excessive joy the Master rebuked, saying, "In this rejoice not that the spirits are subject unto you; but rather rejoice because your names are written in heaven." See Luke x. 17-20. In all their epistles, neither Paul, nor Peter, nor James, nor John once refers to his gifts of healing, excepting in two instances, viz., in Romans xv. 19, and 2 Corinthians xii. 12, in both of which instances Paul merely alludes to his exercise of miraculous power as a proof of his apostleship. This is in marked contrast with the literature of modern faith-healers, who with pen and tongue have never done with this one theme. Christ and the apostles evidently thought *relatively* little of these temporal "gifts" as compared with spiritual "graces."

4. The gifts of healing in apostolic times

were, by God's providence, confined to a few. See 1 Corinthians xii. 9, 28, 30. But modern faith-healers claim this gift as the prerogative of any believer with sufficient faith, and they claim, furthermore, that every believer *should have this faith.*

THE PRACTICE.

1. GREAT claims are put forth at conventions and meetings, and in published works, of numerous and marvelous "cures" wrought by anointing and prayer, without the use of any other means. But, first, let it be well noted, hundreds are not healed at all, who yet want to be healed and who believe they can be. At Mannedorf in Switzerland, where Dorothea Trudel had her faith-cure home, Dr. Cullis says he saw one hundred and fifty patients *waiting to be healed.* The doctor himself says that he receives "hundreds of letters" asking for his prayers. In all the homes, such as that at Mannedorf, in Bethshan in London, Berachah in New York, and Dr. Cullis's various homes in Boston, many are not healed at all. But of these cases the faith-healers give no detailed account, nor do they even indicate the proportion of healed and not healed. Is this honest?

2. Of those reported as "cured" many are not at all "cured." In two volumes entitled "Faith-cures," there are one hundred and fifty cures reported. Of these we find seventy-one, or nearly one-half, are not "cured," but at the best only "benefited," yet they are reported under the head of "Faith-cures." Any ordinary hospital acting thus would be rightly reprimanded as "fraudulent" in its reports. Again, of the one hundred and fifty cases, we find twenty-seven so unclear in their statements that we can make nothing of them. This leaves fifty-two cases which, according to the testimony of the patients themselves, are really cured. The cases reported cover a period of ten years. To be honest in this matter, we claim that all faith-healers should report as do our hospitals, as follows: Patients treated, —. Died, —. Discharged healed, —. Discharged benefited, —. Not benefited, —. Then, and then only, can men judge of the true results of faith-healing.

3d. The enormous majority of the apparently "cured" are very slow in their convalescence, taking weeks, months, and even years to recover. This is far from the scriptural way, which, as we have seen, was practically sudden and complete.

4. But even in the fifty-two cases above mentioned, we are left in doubt as to the reality of the cure, by the singular use of language

which faith-cure folk permit themselves to employ. They are taught by their leaders to claim that they are healed as soon as they have been anointed and prayed over, and that in spite of any subsequent symptoms that may remain. The following quotation from directions to patients, given by a clergyman, is but a sample of all their teaching: "When anointed, BELIEVE THAT YOU DO NOW RECEIVE, *i. e.*, say, I am healed *now*; do not say, I *expect* to be healed. Believe against contrary physical evidence. After having CLAIMED THE PROMISE, be not surprised at the continuance of symptoms and physical pains. You may expect sudden and powerful returns of your sickness after anointings and prayers. But carefully note that they are ONLY TESTS OF YOUR FAITH. You ought not to recognize any disease, believing that God has rebuked it." Such unwonted use of language staggers ordinary mortals, and makes them wary in receiving testimony from those who allow themselves such liberties. The writer addressed a letter to Captain C., who claims to have been "cured" by prayer, asking him, "Are you now perfectly well?" Answer: "Praise the Lord; I am entirely well." Question: "Do your bodily senses bear witness with your faith that you are healed; or do you have to believe in spite of the evidence of your senses?" Answer: "Both; *i. e.*, my bodily senses assure me that for six years I have done everything reasonable for a well man, and have suffered no serious (or any) injury whatever; while I have always to rely on the promises and am tempted by the devil at every possible point. *E. g.*, if I attempt any unusual exertion, Satan says, You will hurt your heart, and *sometimes succeeds in causing a few symptoms*; but I look to Jesus only, and am perfectly delivered." (The italics are ours.) To understand the "true inwardness" of this reply, we must remember that faith-healers make a distinction between disease and "symptoms" so marked that they claim to be healed of disease even while the "symptoms" continue. This being the case, Captain C. can in one sentence affirm that he is "entirely well," while in the next he admits having "a few symptoms." How many, then, of the fifty-two cases out of the one hundred and fifty are of this nature, it is impossible to say without a detailed examination of each case and an inquisitorial form of questioning. Another of the cases widely advertised is that of a lady whose story may be found in Miss Carrie Judd's book entitled "The Prayer of Faith." The second question asked Captain C. was also put to her, with the following answer: "I have walked by faith for eight years, *regardless of the senses.*"

(The italics are hers.) Yet another person said to the writer, "I am healed by faith." When asked if the bodily senses bore witness to the healing, the reply was: "I am healed by faith, but not by my senses." When asked why language was so strangely used, the reply came: "I do not exactly like this way of speaking myself, but the leaders tell us we must say so." Now imagine any hospital physician giving such instructions to his patients, and then advertising them as "cured."

In further elucidation of the singular mental attitude of some of these faith-cure folk, the following is given as a fair specimen of many cases of "cure":

"I have been troubled with headache since I was six years of age. My head would ache violently for three or four hours, then I would become sick at my stomach, and throw off everything I had eaten. I had tried every remedy I knew of, until I was discouraged, and concluded that, perhaps, this was my 'thorn in the flesh,' and that it was not God's will that I should be cured of it. Yet I could not *rest* in that thought; and I want to say, just here, that I believe this is one of the devil's best arguments to keep souls from finding out God's power and love to us poor mortals. But on the 21st of January, Satan had God's own voice to set at nought, and he was, bless the Lord, unable to do it.

"In my attacks of headache I was totally unfitted for duties of any kind, and the day following I would be so weakened that I was almost useless. Well, this day I speak of, I felt my old complaint coming on, and I had a good many other ills pressing me besides. Then God spoke to me by his Word, saying, 'Cast your care on me; *I care for you.*' I did so. I cast everything, unbelief, doubt, headache, 'perhaps it is not God's will,' and all, all, on the Lord. In less time than it takes me to write it my headache was gone.

"But the fight was not over yet. The next day I caught a severe cold, which, with me, is always followed by a raging headache. I awoke the next morning with a very severe one. I asked the Lord what that meant. I had my message the night before; it was this: 'The Lord shall be seen over them.' Zech. ix. 14." [In this connection we may say that many of these faith-healers get their "message" by simply opening the Bible at random, and taking the first verse on which the eye rests. As in this case, they often strike passages which have no more application to them than the command to Peter to go and catch a fish has.] "The Spirit showed me that the Lord would be seen over that headache; so I prayed God to cure me of it. After I had

prayed, this came to me: 'Do you believe it will be done?' I said, 'Yes.' Then the suggestion came, 'If you believe the Lord will do it, you will go about your work just as though it was done.' It had not stopped, but I got up and went to my work, my head aching violently all the time. Satan was as busy as a bee, asking why my head did not stop aching: I had asked and believed, and yet it had not stopped! But God's Word rose above him, '*The Lord shall be seen over them.*' So I fought the devil with these words until near noon, when my faith began to stagger. The devil very cunningly suggested that God would not do it for me, and I began to think so; when these words came with powerful weight: '*It is impossible for God to lie.*' I did not remember at the time to have seen these words anywhere, but I felt sure they were God's words, because the devil fled in an instant. I went home and ate dinner, a thing I never before attempted to do when in such a condition, because I could not keep food on my stomach. But I sat down by faith! and ate, and God rewarded me. But I had a hard fight all the afternoon, and when I came home to supper I felt as though I could not eat a mouthful, I was so sick; yet I believed God would cure me, and I sat down and ate, and then went out to my duties as usual. Finally, when I was all alone, and my faith nearly gone, and when I felt I could hold out no longer, these words came with strength to my soul: '*Thy word is settled in heaven.*' I thought, 'But not on earth,' when a rebuke, kind and gentle, but oh how powerful, came to me: 'If we believe not, yet *he abideth faithful.*' It was enough. It *settled* me. I stopped doubting and trusted; yes, *rested* in the belief that God *would cure me.* It did not make any difference if it was not done till next year; anyway, I would believe, and God would give me the victory. And in a twinkling of an eye the pain left me, and I am cured, bless the Lord. I have not had a headache since (*i. e.*, from Jan. 23-Feb. 18, 1880), but only little trials" [does he mean "symptoms" ?], "which have left me as soon as my soul returned to its rest. I am growing stronger every day. Your brother in the Lord, W. M. H."

This sad case of self-deception is given in full (and it does not stand alone, by any means) chiefly because a physician in regular standing, who ought to know better, publishes it as a "faith-cure," thereby indorsing it. Imagine any such narrative of apostolic healing, and realize how utterly incongruous and pitiful it would appear alongside of such stories as the restoration of Æneas, of Dorcas, or of the ten lepers!

QUESTIONS IN CONCLUSION.

1. ARE not the leaders of this movement guilty either of gross ignorance or of dishonesty when they thus instruct their followers?

2. Do they not pervert the Word of God, and draw deceitful analogies between spiritual healing and bodily cure?

3. Are not the leaders of this movement

also dishonest or grossly careless when they fail to publish lists of the unhealed, of the relapsed, and of the dead?

4. Are not the leaders of this movement inconsistent in not daring (with the exception of Pastor Stockmayer) to face the full logical consequence of their fundamental postulate that the Atonement of Christ avails in this world for sin and its consequences?

A. F. Schauffler.

THE HAUNTED HEART.

AT the parting-hour we stood
In the doorway dim, the night
Underneath a cloudy hood
Hid her jeweled brow from sight.
Like a guest who cometh late,
Wind of Winter as it passed,
Rudely shook the garden-gate,
Angry that the latch was fast—
For the year was dark and cold,
And the frost was on the wold.

Then my lover, straight and tall,
Graceful as the gods of Greece,
Breathed in murmurs musical
Of a land beyond the seas.
Pleading softly: "Come away,
With me, far across the foam,
To the shores of some bright bay
Where the summer makes her home,
Where the year is never cold,
Nor the white frost on the wold.

"Let your blue eyes on my hours,
Stars of beauty, ever shine.
O'er the seas to lands of flowers
Sail with me, and so be mine."
Half a sob, and half a sigh,
Was my answering "No!" Ah me!
Duty then not love chose I,
Though I knew my life would be
Like the year, both dark and cold,—
Frost forever on the wold.

Round me close his arms had been,
When he heard my faltered "No!"
Coldly, sadly, did he then
Loose his hold, and let me go—
Lifted to his lips my hand
In a passion of regret;
Leaned a little forward and
Kissed my cheek—with tears 'twas wet—
Then was gone into the cold,
And the frost, across the wold.

Snow of Winter! some may tell
 What a merry guest thou art;
 But to me each flake that fell,
 Fell and froze upon my heart.
 Wind of Winter! when thy wail
 Rose at midnight, from my sleep
 I have wakened, but to quail
 At my loneliness and weep,
 While the house was dark and cold,
 And the snow lay on the wold.

When the days were short and drear,
 And the nights long, and a mouse
 In the wall would make you fear,—
 Came a Presence in the house;
 Semblance of my love it wore,
 Eyes, and hair, and manner too,
 Just the same as weeks before,
 When he sighed that long adieu,—
 Ere he passed into the cold,
 And the frost, across the wold.

First one night when raged a storm,
 And I started from a dream
 Of him, I beheld his form
 In the firelight's ruddy gleam—
 Arms outstretched in pleading way,
 Eyes that with entreaty shone,—
 Since that time by night or day,
 I am nevermore alone,
 Though the year be hot or cold,—
 Frost or flower upon the wold.

If I read, at noon or night,
 He is just behind my chair;
 If I walk in broad daylight
 Through the rooms, I see him there;
 When I talk with others now,
 I can feel his finger-tips
 On my arm, or on my brow
 Soft the touch of shadowy lips.
 But the lips and hands are cold,—
 As the frost upon the wold.

I am haunted, and shall be
 Till Death's slumber, deep and long,
 Seals for all Eternity
 Eyes to sight and lips to song.
 'Mong the lilies on my breast,
 Will the ghost be laid, forgot,
 When I lie in dreamless rest—
 When to me it matters not
 If the year be dark and cold,
 And the frost upon the wold.

THE introduction of General Paixhans's brilliant invention, the shell-gun, in 1824, followed, in 1858, by the successful application of armor-plating to the steam-frigate *La Gloire*, under Napoleon III., compelled an immediate change in naval construction which startled the maritime countries of Europe, especially England, whose boasted security behind her "wooden walls" was shown to be a complete delusion. The English naval architects, however, did not overlook the fact that their French rivals, while producing a gun which rendered wooden navies almost useless, had also by their armor-plating provided an efficient protection against the destructive Paixhans shell.

Accordingly, the Admiralty without loss of time laid the keel of the *Warrior*, an armored iron steam-frigate 380 feet long, 58 feet beam, 26 feet draught, and 9200 tons displacement. The work being pushed with extraordinary vigor, this iron-clad ship was speedily launched and equipped, the admiration of the naval world.

Shortly after the adoption of armor-plating as an essential feature in the construction of vessels of war, the Southern States seceded from the Union, some of the most efficient of the United States naval officers resigning their commissions. Their loss was severely felt by the Navy Department at Washington; nor was it long before the presence of great professional skill among the officers of the naval administration of the Confederate States became manifest. Indeed, the utility of the armor-plating adopted by France and England proved to be better understood at Richmond than at Washington. While the Secretary of the Navy, Mr. Welles, and his advisers were discussing the question of armor, news reached Washington that the partly burnt and scuttled steam-frigate *Merrimac*, at the Norfolk Navy Yard, had been raised and cut down to her berth-deck, and that a very substantial structure of timber, resembling a citadel with inclined sides, was being erected on that deck.

The Navy Department at Washington had previously advertised for plans and offers for iron-clad steam-batteries to be built within a stipulated time. My attention having been thus called to a subject which I had thoroughly considered during a series of years, I was fully prepared to present plans of an impregnable steam-battery of light draught, suitable to navigate the shallow rivers and harbors of the Confederate States. Availing myself of the services

of a friend who chanced to be in Washington at the time, proposals were at once submitted to a board of naval officers appointed by the President; but the plans presented by my friend being rejected by the board, I immediately set out for Washington and laid the matter personally before its members, all of whom proved to be well-informed and experienced naval experts. Contrary to anticipation, the board permitted me to present a theoretical demonstration concerning the stability of the new structure, doubt of which was the principal consideration which had caused the rejection of the plan presented. In less than an hour I succeeded in demonstrating to the entire satisfaction of the board appointed by President Lincoln that the design was thoroughly practical, and based on sound theory. The Secretary of the Navy accordingly accepted my proposal to build an iron-clad steam-battery, and instructed me verbally to commence the construction forthwith. Returning immediately to New York, I divided the work among three leading mechanical establishments, furnishing each with detailed drawings of every part of the structure; the understanding being that the most skillful men and the best tools should be employed; also that work should be continued during night-time whenever practicable. The construction of nearly every part of the battery accordingly commenced simultaneously, all hands working with the utmost diligence, apparently confident that their exertions would result in something of great benefit to the national cause. Fortunately no trouble or delay was met at any point; all progressed satisfactorily; every part sent on board from the workshops fitted exactly the place for which it was intended. As a consequence of these favorable circumstances, the battery, with steam-machinery complete, was launched in one hundred days from the laying of the keel-plate. It should be mentioned that at the moment of starting on the inclined ways toward its destined element, the novel fighting-machine was named *Monitor*.

Before entering on a description of this *fighting-machine* I propose to answer the question frequently asked: What circumstances dictated its size and peculiar construction?

1. The work on the *Merrimac* had progressed so far that no structure of large dimensions could possibly be completed in time to meet her.

2. The well-matured plan of erecting a citadel of considerable dimensions on the am-

THE MONITOR "WEEHAWKEN" CAPTURING THE "CONFEDERATE IRON-CLAD RAM "ATLANTA,"
WARSAW SOUND, GEORGIA, JUNE 17, 1863.

ple deck of the razed *Merrimac* admitted of a battery of heavy ordnance so formidable that no vessel of the ordinary type, of small dimensions, could withstand its fire.

3. The battery designed by the naval constructor of the Confederate States, in addition to the advantage of ample room and numerous guns, presented a formidable front to an opponent's fire by being inclined to such a degree that shot would be readily deflected. Again, the inclined sides, composed of heavy timbers well braced, were covered with two thicknesses of bar iron, ingeniously combined, well calculated to resist the spherical shot peculiar to the Dahlgren and Rodman system of naval ordnance adopted by the United States Navy.

4. The shallow waters on the coast of the Southern States called for very light draught; hence the upper circumference of the propeller of the battery would be exposed to the enemy's fire unless thoroughly protected against shot of heavy caliber. A difficulty was thus presented which apparently could not be met by any device which would not seriously impair the efficiency of the propeller.

5. The limited width of the navigable parts of the Southern rivers and inlets presented an obstacle rendering manœuvring impossible; hence it would not be practicable at all times to turn the battery so as to present a broadside to the points to be attacked.

6. The accurate knowledge possessed by the adversary of the distance between the forts on the river banks within range of his guns, would enable him to point the latter with such accuracy that unless every part of

the sides of the battery could be made absolutely shot-proof, destruction would be certain. It may be observed that the accurate knowledge of range was an advantage in favor of the Southern forts which placed the attacking steam-batteries at great disadvantage.

7. The difficulty of manipulating the anchor within range of powerful fixed batteries presented difficulties which called for better protection to the crew of the batteries than any previously known.

Several minor points familiar to the naval artillerist and naval architect presented considerations which could not be neglected by the constructor of the new battery; but these must be omitted in our brief statement, while the foregoing, being of vital importance, have demanded special notice.

The plans on pages 282-3 represent a longitudinal section through the center line of the battery, which, for want of space on the page, has been divided into three sections, viz., the forward, central, and aft sections, which for ready reference will be called *forward*, *central*, and *aft*.

Referring particularly to the upper and lower sections, it will be seen that the hull consists of an upper and lower body joined together in the horizontal plane not far below the water-line. The length of the upper part of the hull is 172 feet, beam 41 feet; the length of the lower hull being 122 feet, beam 34 feet. The depth from the underside of deck to the keel-plate is eleven feet two inches, draught of water at load-line ten feet.

Let us now examine separately the three sectional representations.

1. AFT SECTION. LONGITUDINAL PLAN THROUGH THE CENTER LINE OF THE ORIGINAL MONITOR.

Forward Section. The anchor-well, a cylindrical perforation of the overhanging deck, near the bow, first claims our attention. The object of this well being to protect the anchor when raised, it is lined with plate iron backed by heavy timbers, besides being protected by the armor-plating bolted to the outside of the overhang. It should be noticed that this method proved so efficient that in no instance did the anchor-gear receive any injury during the several engagements with the Confederate batteries, although nearly all of the monitors of the *Passaic* class were subjected to rapid fire at short range in upwards of twenty actions. It will be remembered that the unprotected anchor of the *Merrimac* was shot away during the short battle with the *Congress* and the *Cumberland*. Having described the method of protecting the anchors, the mechanism adopted for manipulating the same remains to be explained. Referring to the illustration, it will be seen that a windlass is secured under the deck-beams near the anchor-well. The men working the handles of this mechanism were stationed on the bottom of the vessel, and hence were most effectually protected against the enemy's shot, besides being completely out of sight. The Confederate artilleryists were at first much surprised at witnessing the novel spectacle of vessels approaching their batteries, then stopping and remaining stationary for an indefinite time while firing, and then again departing, apparently without any intervention of anchor-gear. Our examination of this gear and the anchor-well affords a favorable opportunity of explaining the cause of Lieutenant Greene's alarm, mentioned in a statement recently published by a military journal, concerning a mysterious sound emanating from the said well during the passage of the *Monitor* from New York to Fortress Monroe. Lieutenant Greene says that the sound from the anchor-well "resembled the death-groans of twenty men, and was the most dismal, awful sound [he] ever heard." Let us endeavor to trace to some physical cause this portentous sound. The reader will find, on close examination, that the chain cable which suspends the anchor passes through an aperture ("hawse-pipe") on the aft side of the well, and that this pipe is very near the water-

line; hence the slightest vertical depression of the bow will occasion a flow of water into the vessel. Obviously, any downward motion of the overhang will cause the air confined in the upper part of the well, when covered, to be blown through the hawse-pipe along with the admitted water, thereby producing a very discordant sound, repeated at every rise and fall of the bow during pitching. Lieutenant Greene also states that apart from the reported fearful sound, the battery was flooded by the water which entered through the hawse-pipe; a statement suggesting that this flooding was the result of faulty construction, whereas it resulted from gross oversight on the part of the executive officer,—namely, in going to sea without stopping the opening round the chain-cable at the point where it passes through the side of the anchor-well.

The pilot-house is the next important object represented in the forward section of the illustration now under consideration. This structure is situated ten feet from the anchor-well, its internal dimensions being three feet six inches long, two feet eight inches wide, three feet ten inches high above the plating of the deck, the sides consisting of solid blocks of wrought iron, twelve inches deep and nine inches thick, firmly held down at the corners by three-inch bolts passing through the iron-plated deck and deck-beams. The wheel, which by means of ordinary tiller-ropes operates the rudder, is placed within the pilot-house, its axle being supported by a bracket secured to the iron blocks as shown by the illustration. An ordinary ladder resting on the bottom of the battery leads to the grated floor of the pilot-house. In order to afford the commanding officer and the pilot a clear view of objects before and on the sides of the battery, the first and second iron blocks from the top are kept apart by packing pieces at the corners; long and narrow sight-holes being thereby formed extending round the pilot-house, and giving a clear view which sweeps round the entire horizon, all but that part which is hidden by the turret, hardly twelve degrees on each side of the line of keel. Regarding the adequacy of the elongated sight-hole formed between the iron blocks in the manner described, it should be borne in mind

2. CENTRAL SECTION, SAME PLAN.

that an opening of five-eighths of an inch affords a vertical view eighty feet high at a distance of only two hundred yards. More is not needed, a fact established during trials instituted by experts before the constructor delivered the battery to the Government. Unfortunately the sight-holes were subsequently altered, the iron blocks being raised and the opening between them increased to such an extent that at sea, to quote Lieutenant Greene's report, the water entered "with such force as to knock the helmsman com-

pilot-house loose, so as to be readily pushed up from below, was that of affording egress to the crew in case of accident. Had the monitor *Tecumseh*, commanded by Captain T. A. T. Craven, when struck by a torpedo during the conflict in Mobile Bay, August 5, 1864, been provided with a similar loose plate over the main hatch, the fearful calamity of drowning officers and crew would have been prevented. In referring to this untoward event it should be observed that means had been provided in all the sea-going monitors to afford egress in

3. FORWARD SECTION, SAME PLAN.

pletely round from the wheel." It may be shown that but for the injudicious increase of the sight-holes, the commander of the *Monitor* would not have been temporarily blinded during the conflict at Hampton Roads, although he placed his vessel in such an extraordinary position that, according to Lieutenant Greene's report, "a shell from the enemy's gun, the muzzle not ten yards distant, struck the forward side of the pilot-house." The size of the sight-hole, after the injudicious increase, may be inferred from the reported fact that the blast caused by the explosion of the Confederate shell on striking the outside of the pilot-house had the power of "partly lifting the top." This "top," it should be observed, consisted of an iron plate two inches thick, let down into an appropriate groove, but not bolted down—a circumstance which called forth Lieutenant Greene's disapprobation. The object of the constructor in leaving the top plate of the

case of injury to the hull: an opening in the turret floor, when placed above a corresponding opening in the deck, formed a free passage to the turret, the top of which was provided with sliding hatches. Apparently the officer in charge of the turret-gear of Captain Craven's vessel was not at his post, as he ought to have been during action, or else he had not been taught the imperative duty of placing the turret in such a position that these openings would admit of a free passage from below.

Lieutenant Greene's report with reference to the position of the pilot-house calls for particular notice, his assertion being that he "could not fire ahead within several points of the bow." The distance between the center of the turret and the pilot-house being fifty-five feet, while the extreme breadth of the latter is only five feet, it will be found that by turning the turret through an angle of only *six degrees* from the center line of the vessel, the shot will clear the pilot-house, a structure too sub-

stantial to suffer from the mere aerial current produced by the flight of the shot. Considering that the *Monitor*, as reported by Lieutenant Greene, was a "quick-turning vessel," the disadvantage of not being able to fire over the bow within *six degrees* of the line of keel is insignificant. Captain Coles claimed for his famous iron-clad turret-ship the advantage of an all-round fire, although the axis of his

Monitor would not have been ready to proceed to Hampton Roads until the beginning of April, 1862. The damage to the national cause which might have resulted from that delay is beyond computation.

The next important part of the battery delineated on the forward section of the illustration, namely, the quarters of the officers and crew, will now be considered; but before

BOMBARDMENT OF FORT SUMTER AND ADJACENT FORTS, APRIL 7, 1863.

The monitors engaged were the *Weehawken*, *Passaic*, *Montauk*, *Catskill*, *Nahant*, *Patapsco*, and *Nantucket*.

turret guns had many times greater deviation from the line of keel than that of the *Monitor*.

The statement published by Lieutenant Greene, that the chief engineer of the battery immediately after the engagement in Hampton Roads "suggested the clever plan of putting the pilot-house on top of the turret," is incorrect and calls for notice. The obvious device of placing the pilot-house in the center and above the turret was carefully considered before the *Monitor* turret was constructed, but could not be carried out for these reasons:

1. The turret of the battery was too light to support a structure large enough to accommodate the commanding officer, the pilot, and the steering-gear, under the severe condition of absolute impregnability against solid shot from guns of ten-inch caliber employed by the Confederates.

2. A central stationary pilot-house connected with the turret involved so much complication and additional work (see description of turret and pilot-houses further on), that had its adoption not been abandoned the

entering on a description it should be mentioned that in a small turret-vessel built for fighting, only one-half of the crew need be accommodated at a time, as the other half should be in and on the turret, the latter being always covered with a water-proof awning. Referring again to the forward and to part of the central section, it will be seen that the quarters extend from the transverse bulkhead under the turret to within five feet of the pilot-house, a distance of fifty feet; the forward portion, twenty-four feet in length, being occupied by the officers' quarters and extending across the battery from side to side. The height of the aft part of these quarters is eight feet six inches under the deck-beams; while the height of the whole of the quarters of the crew is eight feet six inches. A mere glance at the illustrations showing a side elevation [page 283] and top view of internal arrangement [page 286] gives a correct idea of the nature of the accommodations prepared for the officers and crew of the battery which Lieutenant Greene

CAPTURE OF FORT FISHER, JANUARY 15, 1864. (DRAWN BY J. O. DAVIDSON, FROM LITHOGRAPHS BY ENDICOTT & CO.)

PLAN OF THE BERTH-DECK OF THE ORIGINAL MONITOR, DRAWN TO SCALE.

a, captain's cabin ; *b*, his state-room ; *c*, state-rooms of the officers ; *w*, ward-room ; *d*, quarters of the crew, with store-rooms on the sides.

regards as a "crude" structure, and of which he says: "Probably no ship was ever devised which was so uncomfortable for the crew." If this opinion were well founded, it would prove that submerged vessels like the monitors are unfit to live in.

Fortunately, the important question whether crews can live permanently below water-line has been set at rest by the report of the chief of the Bureau of Medicine and Surgery to the Secretary of the Navy, 1864. This minute and carefully considered report enabled the naval administration, organized by President Lincoln, to prove the healthfulness of the monitors, by the following clear presentation of the subject: "The monitor class of vessels, it is well known, have but a few inches of their hulls above the water-line, and in a heavy sea are entirely submerged. It has been doubted whether under such circumstances it would be possible long to preserve the health of the men on board, and consequently maintain the fighting material in a condition for effective service. It is gratifying, therefore, to know that an examination of the sick-reports, covering a period of over thirty months, shows that, so far from being unhealthy, there was less sickness on board the monitors than on the same number of wooden ships with an equal number of men and in similar exposed positions. The exemption from sickness upon the iron-clads in some instances is remarkable. There were on board the *Saugus*, from November 25th, 1864, to April 1st, 1865, a period of over four months, but four cases of sickness (excluding accidental injuries), and of these two were diseases with which the patients had suffered for years. On the *Montauk*, for a period of one hundred and sixty-five days prior to the 29th of May, 1865, there was but one case of disease on board. Other vessels of the class exhibit equally remarkable results,

and the conclusion is reached that no wooden vessels in any squadron throughout the world can show an equal immunity from disease."

Apart from the ample size of the quarters on board the battery, shown by the illustration, it should be mentioned that the system adopted for ventilating those quarters furnishes an abundant supply of fresh air by the following means. Two centrifugal blowers, driven by separate steam-engines,

furnished seven thousand cubic feet of atmospheric air per minute by the process of suction through standing pipes on deck. Part of the air thus drawn in supported the combustion of the boiler furnaces, the remainder entering the lower part of the hull, gradually expelling the heated and vitiated air within the vessel. It has been imagined that the fresh air supplied by the blowers ought to have been conveyed to the quarters at the forward end of the vessel, by a system of conducting pipes. The laws of static balance, however, render the adoption of such a method unnecessary, since agreeably to those laws the fresh cold air, unless it be stopped by closed doors in the bulkheads, will find its way to every part of the bottom of the hull, gradually rising and expelling the upper heated strata through the hatches, and lastly through the grated top of the turret. Naval constructors who speculate on the cause of the extraordinary healthfulness of the monitors need not extend their researches beyond a thorough investigation of the system of ventilation just described.

Turret Department. The most important object delineated on the *central* section of the illustration, namely, the rotating turret, will now be considered ; but before describing this essential part of the monitor system, it will be well to observe that the general belief is quite

SIDE ELEVATION OF A FLOATING REVOLVING CIRCULAR TOWER, PUBLISHED BY ABRAHAM BLOODGOOD IN 1807.

FLOATING CIRCULAR CITADEL, SUBMITTED TO THE FRENCH DIRECTORY IN 1798.

erroneous that a revolving platform, open or covered, is a novel design. So far from that being the case, this obvious device dates back to the first introduction of artillery. Sixty-four years ago the writer was taught by an instructor in fortification and gunnery that under certain conditions a position assailable from all sides should be defended by placing the guns on a turn-table. Long before building the *Monitor* I regarded the employment of a revolving structure to operate guns on board ships as a device familiar to all well-informed naval artillerists. But although constructors of revolving circular gun-platforms for naval purposes, open or covered, have a right to employ this ancient device, it will be demonstrated further on that the turret of the monitors is a distinct mechanical combination differing from previous inventions. The correctness of the assumption that revolving batteries for manipulating guns on board floating structures had been constructed nearly a century ago will be seen by the following reference to printed publications.

The "Nautical Chronicle" for 1805 contains an account of a "movable turning impregnable battery, invented by a Mr. Gillespie, a native of Scotland, who completed the model of a movable impregnable castle or battery, impervious to shot or bombs, provided with a cannon and carriage calculated to take a sure aim at any object." It is further stated that "the invention proposed will be found equally serviceable in floating batteries. Its machinery is adapted to turn the most ponderous mortars

with the greatest ease, according to the position of the enemy." Again, the Transactions of the Society for the Promotion of Useful Arts in the State of New York, 1807, contains an illustration representing a side elevation of a circular revolving floating battery constructed by Abraham Bloodgood (see cut on page 286). The guns of this battery, as the inventor points out, "would be more easily worked than is common, as they would not require any lateral movement." It is also stated, as a peculiar feature of this floating battery, that "its rotary motion would bring all its cannon to bear successively, as fast as they could be loaded, on objects in any direction"; and that "its circular form would cause every shot that might strike it, not near the center, to glance." Thirty-five years after the publication of the illustration and description of the circular floating revolving tower of Abraham Bloodgood, Theodore R. Timby proposed to build a tower on land for coast defense, to be composed of iron, with several floors and tiers of guns, the tower to turn on a series of friction-rollers under its base. The principal feature of Timby's "invention" was that of arranging the guns radially within the tower, and firing each gun at the instant of its coming in line with the object aimed at during the rotary motion of the tower, precisely as invented by Bloodgood. About twenty years ago certain influential citizens presented drawings of Timby's revolving tower to the authorities at Washington, with a view of obtaining orders to build such towers for coast defense; but

the plan was found to be not only very expensive, but radically defective in principle. The slides of the gun-carriages being fixed permanently in a radial direction within the tower, the guns, of course, are directed to all

Unfortunately, before the battery left New York for Hampton Roads, it was suggested at the Navy Yard to insert a plaited hemp rope between the base of the turret and the bronze ring, for the purpose of making the

BATTLE OF MOBILE BAY, AUGUST 5, 1864. THE MONITORS CAPTURING THE IRON-CLAD RAM "TENNESSEE."

points of the compass. Hence, during an attack by a hostile fleet, with many ships abreast, only one assailant can be fired at, its companions being scot-free in the dead angle formed between the effective gun and the guns on either side. In the mean time the numerous guns, distributed round the tower on the several floors, cannot be fired until their time comes during the revolution of the tower. The enemy's fleet continuing its advance, of course, calls for a change of elevation of the pieces, which, considering the constant revolution of the tower and the different altitudes above the sea of the several tiers, presents perplexing difficulties. Nothing further need be said to explain why the Government did not accept the plans for Timby's revolving towers.

The origin of rotating circular gun-platforms being disposed of, the consideration of the central section of the illustration will now be resumed. It will be seen that the turret which protects the guns and gunners of the *Monitor* consists simply of a short cylinder resting on the deck, covered with a grated iron roof provided with sliding hatches. This cylinder is composed of eight thicknesses of wrought-iron plates, each one inch thick, firmly riveted together, the inside course, which extends below the rest, being accurately faced underneath. A flat, broad ring of bronze is let into the deck, its upper face being very smooth in order to form a water-tight joint with the base of the turret without the employment of any elastic packing, a peculiar feature of the turrets of the monitors, as will be seen further on.

joint perfectly water-tight. As might have been supposed, the rough and uneven hemp rope did not form a perfect joint; hence during the passage a great leak was observed at intervals as the sea washed over the decks. "The water came down under the turret like a waterfall," says Lieutenant Greene in his report. It will be proper to observe in this place that the "foundering" of the *Monitor* on its way to Charleston was not caused by the "separation of the upper and lower part of the hull," as was imagined by persons who possessed no knowledge of the method adopted by the builders in joining the upper and lower hulls. Again, those who asserted that the plates had been torn asunder at the junction of the hulls did not consider that severe strain cannot take place in a structure nearly submerged. The easy motion at sea, peculiar to the monitors, was pointed out by several of their commanders. Lieutenant Greene in his report to the Secretary of the Navy, dated on board the *Monitor*, March 27, 1862, says with reference to sea-going qualities:

"During her passage from New York her roll was very easy and slow and not at all deep. She pitched very little and with no strain whatever."

Captain John Rodgers's report to the Secretary of the Navy, dated on board the monitor *Weehawken*, January 22, 1863, refers specially to the easy motion of his vessel:

"On Tuesday night, when off Chincoteague shoals, we had a very heavy gale from the E. N. E. with a very heavy sea, made confused and dangerous by the

proximity of the land. The waves I measured after the sea abated; I found them twenty-three feet high. They were certainly seven feet higher in the midst of the storm. During the heaviest of the gale I stood upon the turret and admired the behavior of the vessel. She rose and fell to the waves, and I concluded that the monitor form had great sea-going qualities. If leaks were prevented no hurricane could injure her."

The true cause of the foundering of the *Monitor* was minutely explained to the writer some time after the occurrence by the engineer, a very intelligent person, who operated the centrifugal pumping-engine of the battery at the time. According to his statement, oakum was packed under the base of the turret before going to sea, in order to make sure of a water-tight joint; but this expedient failed altogether, the sea gradually washing out the oakum in those places where it had been loosely packed, thereby permitting so large a quantity of water to enter under the turret, fully sixty-three feet in circumference, that the centrifugal pumping-engine had not sufficient power to expel it. The hull consequently filled gradually and settled, until at the expiration of about four hours the battery went to the bottom. It will be asked, in view of the preceding explanation of the construction of the monitor turrets, namely, that the smooth base of the turret forms a water-tight joint with the ring on the deck, why was oakum packed under the turret before going to Charleston? The commander of the battery, Captain Bankhead, in his report of the foundering, adverts to the admission of water under the turret, but does not duly consider the serious character of

out against the pressure of the wind on the top hampers, from which the monitors were free.

The diagram gives a front view of the boilers and furnaces; also a side elevation of the rotating cylindrical turret which proved impregnable against ten-inch solid shot fired with battering charges at very short range.

the leak, sixty-three feet in length. Captain Bankhead evidently had not carefully investigated the matter when he attributed the accident to an imaginary separation of the upper and lower hull. It should be observed, in justice to this officer, that having commanded the *Monitor* only during a brief period he possessed but an imperfect knowledge of his vessel, and probably knew nothing regarding the consequence of employing packing,—namely, that it might cause “water to come down under the turret like a waterfall,” as previously reported by the second officer in command. Having explained that Captain Bankhead had

not commanded the battery long enough to become fully acquainted with its construction, it will be proper to mention as a mitigating circumstance in favor of the second officer, Lieutenant Greene, that previous to the battle in Hampton Roads he had “never performed any but midshipman duty.” The important question, therefore, must remain unanswered, whether the *Monitor*, like the other vessels of her type, might not in the hands of an older and more experienced executive officer have reached Charleston in safety.

Referring again to the central part of the

ON DECK.

LAUNCH OF THE "DICTATOR" FROM THE DELAMATER IRON WORKS, DECEMBER 27, 1863.

illustration, page 283, and the sectional representation of the turret, it will be found that the guns are placed across the vessel, consequently only the end of the breech and upper part of the port-hole are seen. The object of the pendulum port-stoppers suspended under the roof is to afford protection to the turret crew while loading the guns. Generally, however, the turret should be moved, and the port-holes thereby turned away from the enemy. Much time was lost during the conflict with the *Merrimac* by closing the port-stoppers in place of merely moving the turret, the latter operation being performed by a small steam-engine controlled by a single hand; while opening and closing the port-stoppers, as reported by Lieutenant Greene, required the entire gun-crew. The slow fire of the *Monitor* during the action, complained of by critics, was no doubt occasioned by an injudicious manipulation of the port-stoppers. There are occasions, however,

when the turret should not be turned, in which case the port-stoppers are indispensable. The method adopted for turning the turret will be readily understood. The small steam-engine controlled by one man, before referred to, drives a double train of cog-wheels connected with the vertical axle of the turret, this axle being stepped in a bronze bearing secured to the central bulkhead of the battery. The mechanism thus described was carefully tested before the *Monitor* left New York for Hampton Roads, and was found to move very freely, the turret being turned and the guns accurately pointed by the sailing-master without aid. The trouble reported by Lieutenant Greene regarding the manipulation of the turret was caused by inattention during the passage from New York; the working-gear having been permitted to rust for want of proper cleaning and oiling while exposed to the action of salt water entering under the turret, from causes already explained.

THE "DICTATOR" AT SEA.

Amidships is seen the elevated promenade deck to which the ship's company resort when driven from the main deck by the seas.

Having thus briefly described the turret and its mechanism, our investigation of the central part of the sectional view of the battery will be completed by a mere reference to the steam-boilers placed aft of the turret. There are two of these boilers placed side by side, as shown in the cut on page 290. Two views being thus presented, the nature of the boilers will be understood without further explanation. It should be mentioned, however, that they proved very economical and efficient.

Aft Section. The following brief reference to this section of the sectional illustration, showing the motive engine, propeller, and rudder, will complete our description of the battery :

1. The motive engine, the construction of which is somewhat peculiar, consists of only

one steam-cylinder with pistons applied at opposite ends, a steam-tight partition being introduced in the middle. The propeller-shaft has only one crank and one crank-pin, the difficulty of "passing the centers" being overcome by the expedient of placing the connecting-rods, actuated by the steam-pistons, at right angles to each other. Much space is saved within the vessel by employing only one steam-cylinder, an advantage of such importance in the short hulls of the monitors that the entire fleet built during the war was provided with engines of the stated type.

2. The propeller, being of the ordinary four-bladed type, needs no description ; but the mode of protecting the same against shot demands full explanation. Referring to the illustration, it will be seen that the under side

TRANSVERSE SECTION OF THE MONITOR "DICTATOR" THROUGH THE CENTER LINE OF THE STEAM CYLINDERS.

The diagram shows the application of rock-shafts and vibrating levers by which the problem of placing engines with vertical cylinders below the water-line has been solved.

of the overhang near the stern is cut out in the middle, forming a cavity needed to give free sweep to the propeller-blades; the slope of the said cavity on either side of the propeller being considerably inclined in order to favor a free passage of the water to and from the propeller-blades.

3. The extreme beam at the forward side of the propeller-well is thirty-one feet, while the diameter of the propeller is only nine feet;

pronounced the entire structure a fine specimen of naval engineering.

The conflict in Hampton Roads, and the immediate building of a fleet of sea-going monitors by the United States Government, attracted great attention in all maritime countries, especially in the north of Europe. Admiral Lessoffsky of the Russian navy was at once ordered to be present during the completion and trial of our sea-going monitors.

THE MONITOR "MONTAUK" DESTROYING THE CONFEDERATE PRIVATEER "NASHVILLE," OGEECHEE RIVER, GEORGIA.

it will therefore be seen that the deck and side armor projects eleven feet on each side, thus protecting most effectually the propelling instrument as well as the equipoise rudder applied aft of the same. It will be readily admitted that no other vessel constructed here or elsewhere has such thorough protection to rudder and propeller as that just described.

THE foregoing description of the hastily constructed steam-battery proves that, so far from being, as generally supposed, a rude specimen of naval construction, the *Monitor* displayed careful planning, besides workmanship of superior quality. Experts who examined the vessel and machinery after completion

The report of this talented officer to his government being favorable, the Emperor immediately ordered a fleet of twelve vessels on the new system, to be constructed according to copies of the working drawings from which the American sea-going monitors had been built. Sweden and Norway also forthwith laid the keels of a fleet of seven vessels of the new type, Turkey rapidly following the example of the northern European nations. It will be remembered that during the naval contest on the Danube the Russian batteries and torpedo boats subjected the Turkish monitors to severe tests. England, in due course, adopted our turret system, discarding the turn-table and cupola.

Many prominent naval architects in the European maritime countries warmly advocated our system of war-vessels with turrets and low freeboard. In England the subject was critically investigated by ship-constructors

require the sides of the ship to rise much above the water's edge; that you should not require more protection to the guns than would contain the guns and gunners; that you should be content with as many guns as the ship

TRANSVERSE SECTION OF THE HULL OF A SEA-GOING MONITOR THROUGH THE CENTER LINE OF THE TURRET AND PILOT-HOUSE.

of the highest standing; the following epitome presents their views of the monitor system :

"1. It is a creation altogether original, peculiarly American, admirably adapted to the special purpose which gave it birth. Like most American inventions, use has been allowed to dictate terms of construction, and purpose not prejudice has been allowed to rule invention. The ruling conditions of construction for the inventor of the American fleet were these: the vessels must be perfectly shot-proof; they must fight in shallow water; they must be able to endure a heavy sea, and pass through it, if not fight in it. The American iron-clad navy is a child of these conditions. Minimum draught of water means minimum extent of surface; perfect protection means thickness to resist the heaviest shot, and protection for the whole length of the ship; it also means perfect protection to guns and gunners. Had they added, what English legislators exact, that the ports shall lie in the ship's side, nine feet above the water, the problem might at once have become impossible and absurd; but they wanted the work done as it could be done, and allowed the conditions of success to rule the methods of construction.

"2. The conditions of success in the given circumstances were these: that you should not

could carry, and no more. To do the work, therefore, the full thickness of armor required to keep out the enemy's shot was taken, but the ship was made to rise a few inches above water, and no more; and so a narrow strip of thick armor, all along the upper edge of the ship's side, gave her complete protection. Thus the least quantity of thickest armor did most work in protecting the ship, engines, boilers, and magazine. Next, to protect the guns, a small circular fortress, shield, or tower encircled a couple of guns, and, if four guns were to be carried, two such turrets carried the armament and contained the gunners. Thus, again, weight of armor was spared to the utmost, and so both ship and armament were completely protected. But the consequences of these conditions are such as England, at least for sea-going ships, would reluctantly accept. The low ship's side, in a seaway, allows the sea to sweep over the ship, and the waves, not the sailors, will have possession of the deck. The American accepts the conditions, removes the sailors from the deck, allows the sea to have its way, and drives his vessel through, not over, the sea to her fighting destination by steam, abandoning sails. The American also cheerfully accepts the small round turret as protection for guns

and men, and pivots them on a central turntable in the middle of his ship, raising his port high enough to be out of the water, and then fighting his guns through an aperture little larger than its muzzle. By thus frankly accepting the conditions he could not control, the American did his work and built his fleet. It is beyond doubt that the American *Monitor* class, with two turrets in each ship, and two guns in each turret, is a kind of vessel that can be made fast, shot-proof, and sea-going. It may be uncomfortable, but it can be made secure. The sea may possess its deck, but in the air, above the sea, the American raises a platform on the level of the top of his turrets, which he calls his hurricane-deck [see illustration of the *Dictator* at sea, page 292], whence he can look down with indifference at the waves furiously foaming and breaking themselves on the abandoned deck below. His vessel, too, has the advantage, as he thinks it, of not rolling with the waves; so that he can take his aim steadily and throw his shot surely. Thus, if he abandons much that we value, he secures what he values more. It may be shown that the American turret ships, of the larger class, with two turrets and four guns, are successful vessels—successful beyond the measure of English estimate of their success. Like so many American inventions, they are severely subject to the conditions of use, and successful by the rigidity and precision with which they fit the end and fulfill the purpose which was their aim. The design of these vessels has about it all the characteristics of American audacity. Every conventionality has been despised and discarded; in the sailor's sense of the word, there is nothing 'ship-shape' about this original *Monitor*; everything is unusual. She has neither keel, nor bilges, nor bulwarks. She is covered by a great horizontal platform of timber, projecting beyond her deck and descending below the water-line. This great upper platform in no way conforms to the shape of the under-ship which carries it; it is obviously meant to shelter the rudder and the stern from every attempt to damage them by shot or collision. At the bow the entire hull is equally protected by the overhanging platform of the deck."

The correctness of the views entertained by the English naval constructors was practically demonstrated by the performance of the monitors during the civil war. Impregnability proved by capability to keep out Confederate shot, being demanded by President Lincoln and promised by the constructor of the fleet which was built during the early part of 1862, it will be proper to inquire how far the performance accorded with anticipation. Admiral Dahlgren, the distinguished naval artillery,

commanding the blockading fleet at Charleston, reported to the Navy Department that from July 18 to September 8, 1863, a period of fifty-two days, the monitors *Weehawken*, *Patapsco*, *Montauk*, *Nahant*, *Catskill*, and *Passaic* engaged Forts Sumter, Moultrie, Wagner, Gregg, and the batteries on Morris and Sullivan's islands, on an average ten times each, the *Montauk* going before the muzzles of the enemy's guns fifteen times during the stated period, while the *Patapsco* was engaged thirteen times and the *Weehawken* twelve times. The number of hits received by the six vessels mentioned amounted to 629; yet not a single penetration of side armor, turret, or pilot-house took place. Admiral Dahlgren observes that the *Montauk* was struck 154 times during the engagements referred to, "almost entirely," he states, "by ten-inch shot." Considering that the hull of the *Montauk* was nearly submerged, hence presenting a very small target, the recorded number of hits marked splendid practice on the part of the Confederate gunners. The report of the experienced commander concludes thus: "What vessels have ever been subjected to such a test?" It merits special notice that the same monitors which Admiral Dahlgren thus found to possess such remarkable power of endurance had led the unsuccessful attack at Charleston three months previously,—a circumstance which shows that difficulties presented themselves during that attack which had not been foreseen, or the magnitude of which had not been properly estimated. The attack referred to being one of the leading incidents of the civil war, the following facts connected with the same cannot properly be withheld in this place, more particularly since these facts rebut the allegation that injudicious advice to certain officers induced the Navy Department to adopt hazardous expedients in connection with the attack on Charleston. A letter from the Assistant-Secretary of the Navy in reference to the contemplated attack, written before the news of its failure had been received, contained the following sentence:

"Though everybody is despondent about Charleston, and even the President thinks we shall be defeated, I must say that I have never had a shadow of a doubt as to our success, and this confidence arises from careful study of your marvelous vessels."

To this letter the following reply was forwarded the next day:

"I confess that I cannot share in your confidence relative to the capture of Charleston. I am so much in the habit of estimating force and resistance that I cannot feel sanguine of success. If you succeed, it will not be a mechanical consequence of your 'marvelous' vessels, but because you are marvelously fortunate. The most I dare hope is, that the contest will end without

INTERIOR VIEW OF THE TURRET OF A SEA-GOING MONITOR.

The compact form of the gun-carriages, the simplicity of the massive port-stoppers, and the enormous size of the spherical projectiles (15-inch diameter) surprised naval experts.

the loss of that prestige which your iron-clads have conferred on the nation abroad. A single shot may sink a ship, while a hundred rounds cannot silence a fort, as you have proved on the *Ogeechee*. The immutable laws of force and resistance do not favor your enterprise. Chance, therefore, can alone save you."

The discomfiture of the "marvelous" vessels before Charleston, however, did not impair their fitness to fight other battles. It will be recollected that the *Weehawken*, commanded by the late Admiral John Rodgers, defeated and captured the Confederate ram *Atlanta*, in Warsaw Sound, June 17, 1863, ten weeks *after* the battle of Charleston; consequently, *previous* to the engagements in which this monitor participated, as reported by Admiral Dahlgren. The splendid victory in Warsaw Sound did not attract much atten-

tion in the United States, while in the European maritime countries it was looked upon as an event of the highest importance, since it established the fact, practically, that armor-plating of the same thickness as that of *La Gloire* and the *Warrior* could be readily pierced, even when placed at an inclination of only twenty-nine degrees to the horizon. Moreover, the shot from the *Weehawken* struck at an angle of fifty degrees to the line of keel, thereby generating a compound angle, causing the line of the shot to approach the face of the armor-plate within twenty-two degrees. The great amount of iron and wood dislodged by the fifteen-inch spherical shot entering the citadel, protected by four-inch armor-plating and eighteen-inch wood backing, was shown by the fact that forty men on the *Atlanta's* gun-deck were prostrated by the concussion, fifteen being wounded, principally by splinters; a circumstance readily explained, since penetration at an angle of twenty-two degrees means that, independent of deflection, the shot must pass through nearly five feet of obstruction,—namely, eleven inches of iron and four feet of wood. Rodgers's victory in Warsaw Sound, therefore, proved that the four-and-a-half-inch vertical plating of the magnificent *Warrior* of nine thousand tons—the pride of the British Admiralty—would present a mere pasteboard protection against the fifteen-inch monitor guns.

TRANSVERSE SECTION OF AN IRON-CLAD STEAM-BATTERY THROUGH THE CENTER LINE OF ITS REVOLVING SEMI-SPHERICAL TURRET—SUBMITTED TO NAPOLEON III. IN THE LATTER PART OF 1854.

The destruction of the Confederate privateer *Nashville* by the *Montauk*, February 28, 1863, also calls for a brief notice. The expedient by which this well-appointed privateer was destroyed, just on the eve of commencing a series of depredations in imitation of the *Alabama*, must be regarded as a feat which has no parallel in naval annals. The commander of the *Montauk*, the present Admiral Worden, having received stringent orders to prevent the *Nashville* from going to sea, devised a plan for destroying the privateer (then occupying a safe position beyond a torpedo obstruction on the Ogeechee River), by means of the fifteen-inch shells which formed part of his equipment; but in order to get near enough for effective shelling, he was compelled to take up a position under the guns of Fort McAllister, then commanded by a Confederate officer of distinguished ability. Obviously, the success of the daring plan of not returning the concentrated flanking fire from the fort while shelling the privateer depended on the power of endurance of the *Montauk*, then for the first time subjected to such a crucial test. The result proved that Worden had not overestimated the resisting power of his vessel. The fifth shell had scarcely reached its destination when signs of serious damage on board the privateer were observed; a few additional shells being dispatched, a volume of black smoke was seen rising above the doomed *Nashville*. The shelling was continued for a short time, with the result that the entire hull of the intended depredator was enveloped in flames. The magazine ultimately exploded with terrific violence, tearing part of the structure into fragments. The gunners in the Confederate fort, McAllister, had in the mean time continued to practice against the *Montauk*; but no serious damage having been inflicted, the anchor was raised and the victor dropped down the river, cheered by the crews of the blockading fleet.

The cut on page 294 represents a transverse section through the turret and pilot-house of the *Montauk* and other sea-going vessels of the monitor type. It will be noticed that the pilot-house is placed above the turret, an arrangement which for lack of time could not be adopted in the original *Monitor*, as before particularly referred to. Evidently the pilot-house must remain stationary while the turret is being turned for the purpose of directing the guns; consequently it can derive no support from the turret; a stationary central shaft of wrought iron resting on the bottom of the vessel has therefore been introduced to carry the weight of the pilot-house, the substantial wrought-iron floor of which rests on the top of the shaft. The method adopted

in constructing the *Monitor* turret, before described, of allowing the base of the same to rest on the deck, obviously calls for means of relieving the pressure caused by the great weight of the revolving structure before going into action; otherwise a very powerful engine and a complex arrangement of cog-wheels would be necessary in order to point the guns. The turret itself must therefore be supported by the central shaft, for which purpose the latter is provided with two strong collars,—one under the turret flooring nearly on a level with the deck of the vessel, the other at a point just below the roof of the turret. Referring to the illustration (page 294), it will be seen that diagonal braces connect the central part of the turret roof with the ends of the gun-slides, which latter consist of heavy girders of wrought iron stretching across the turret, to which they are firmly bolted. Corresponding diagonal braces applied below connect the ends of the gun-slides with the bearings into which the vertical shaft is stepped. The turret, the base of which is accurately faced underneath, rests on a smooth ring composed of bronze let into the deck, the base and this ring forming a water-tight joint at all times, even when the weight of the turret is partially relieved by keying up the central shaft. The port-stopper consists simply of a massive crank of wrought iron placed vertically, turning on a central pivot, readily operated by two men, and requiring only a few seconds in opening and closing. When turned in a line with the axis of the gun it closes the port, and when turned at right angles, as shown in the illustration, permits the gun to be run out. By means of a small steam-engine and a train of cog-wheels, the turret is turned and the guns pointed, as previously explained. The turret and pilot-house are perfectly cylindrical, each being composed of eleven plates of wrought iron, one inch thick, riveted together by "lapping" the same in a very peculiar manner insuring great strength. The pilot-house, provided with numerous sight-holes, generally elongated, is sufficiently large to accommodate the commanding officer, pilot, and helmsman. The mechanism for transmitting the power from the wheel to the tiller-ropes which control the rudder is quite novel. The success of this apparently complex mechanism has called forth favorable comments among European naval engineers, who all admit that a closed rotating gun-platform is not complete unless it is provided with an impregnable stationary protection for the commanding officer, pilot, and helmsman. A device which allows the commander to watch in perfect safety the movements of his opponent, instruct his helmsman, and direct the

LONGITUDINAL SECTION OF THE BOW OF AN IRON VESSEL OF THE "DESTROYER" TYPE, SHOWING ITS SUBMARINE GUN, EXPLOSIVE PROJECTILE, AND SEA-VALVES.

gunners under his feet, without changing his position, may well be deemed a mechanical triumph.

Regarding the plan of the *Monitor* and its origin, it should be stated that during the month of September, 1854, I presented a drawing and description of an iron-clad steam-battery to the Emperor Napoleon III.* This battery, like the *Monitor*, carried in its center a rotating circular gun-platform protected by a semi-spherical cupola composed of wrought iron six inches thick, the rotary platform and cupola being supported by a vertical axle resting on the bottom of the battery and operated by a steam-engine and a train of cog-wheels geared to the axle, as in the *Monitor*. The deck of this original battery was composed of plate iron three inches thick, curved upwards, the sides being entirely submerged, as shown by the illustration representing a transverse section of the hull through the center of the gun-platform and cupola. The peculiar form of this transverse section calls for an explanation,—namely, the keel consists of a square hollow box filled with cast iron, the weight of which is necessary to give stability to the structure. The illustration (page 296), it should be mentioned, is a facsimile of the drawing presented to the French Emperor. Regarding the internal arrangement of the battery, the fact calls for special notice that it was provided with a cylindrical tube for expelling submarine projectiles charged with explosives for destroying ships. The original battery submitted to Napoleon III. may, therefore, be regarded as a duplex fighting-machine, capable of attacking an enemy by an improved method of firing above water, together with the application of *submarine artillery* for expelling projectiles under water, capable of piercing the lower part of the hull

of iron-clads, thereby rendering the employment of armor-plating as a means of protection practically useless.

The nautical community is aware that I have recently built a vessel, the *Destroyer* (now lying at the wharf in the United States Navy Yard at Brooklyn), provided with a submarine gun. The *Destroyer* is an iron vessel one hundred and thirty feet long, seventeen feet wide, eleven feet deep, protected by a wrought-iron breastwork of great strength applied near the bow. The submarine gun, a formidable piece of ordnance of sixteen-inch caliber and thirty feet length, is placed on the bottom of the vessel, the muzzle projecting through an opening in the stem, as shown by the illustration representing a longitudinal section of the bow of the *Destroyer*. The projectile expelled by the submarine gun is twenty-five feet long, its weight being fifteen hundred pounds, including an explosive charge of three hundred pounds of gun-cotton, its form being shown by the above illustration. It is hardly necessary to point out that the carrier of the submarine gun is intended to supersede the costly ships called steam-rams, admitted to be the most powerful offensive weapons for naval purposes hitherto constructed. The *Destroyer* attacks bows on, and discharges the projectile at a distance of three hundred feet from the ship attacked. Experts need not be told that the explosion of three hundred pounds of gun-cotton against the lower part of a ship's hull will shatter it so completely that the expedient of employing water-tight compartments will be of no avail. Naval experts who have been present during the trials of the submarine gun of the *Destroyer* can give good reasons for not taking a warm interest in the present contest between armor-plates two feet thick and one-

* The Emperor promptly acknowledged the receipt of the plans, through General Favé, who said in his letter: "L'Empereur a examiné lui-même avec le plus grand soin le nouveau système d'attaque navale que

vous lui avez communiqué. S. M. me charge d'avoir l'honneur de vous informer qu'elle a trouvé vos idées très ingénieuses et dignes du nom célèbre de leur auteur."

hundred-ton guns. Considering the defenseless condition of New York and other important seaports, it may be urged that the United States should no longer lose time by watching the contest between the plate manufacturers of Sheffield and Essen; nor should time be lost by investigations intended to decide the merits of Krupp and Armstrong guns.

The Committee of Naval Affairs of the Senate, during the last session of Congress, in view of the fact that this country possesses no plant for producing either thick armor-plates or big

guns, reported a bill (passed by the Senate February 27, 1885) for purchasing the *Destroyer*, in order to enable the Navy Department to test experimentally the efficacy of submarine artillery. The defense of the seaports of the United States by the new method of piercing iron-clads in spite of their thick armor-belt will in due time demonstrate that a conflict between an *Inflexible* and a *Destroyer* will be shorter and more decisive than that between the *Merrimac* and the *Monitor*.

John Ericsson.

THE LOSS OF THE MONITOR.*

BY A SURVIVOR.

AT daybreak on the 29th of December, 1862, at Fort Monroe, the *Monitor* hove short her anchor, and by ten o'clock in the forenoon she was under way for Charleston, South Carolina, in charge of Commander J. B. Bankhead. The *Rhode Island*, a powerful side-wheeled steamer, was to be our convoy, and to hasten our speed she took us in tow with two long twelve-inch hawsers. The weather was heavy with dark, stormy-looking clouds and a westerly wind. We passed out of the Roads and rounded Cape Henry, proceeding on our course with but little change in the weather up to the next day at noon, when the wind shifted to the south-south-west and increased to a gale. At twelve o'clock it was my trick at the lee wheel, and being a good hand I was kept there. At dark we were about seventy miles at sea, and directly off Cape Hatteras. The sea rolled high and pitched together in the peculiar manner only seen at Hatteras. The *Rhode Island* steamed slowly and steadily ahead. The sea rolled over us as if our vessel were a rock in the ocean only a few inches above the water, and men who stood abaft on the deck of the *Rhode Island* have told me that several times we were thought to have gone down. It seemed that for minutes we were out of sight, as the heavy seas entirely submerged the vessel. The wheel had been temporarily rigged on top of the turret, where all the officers, except those on duty in the engine-room, now were. I heard their remarks, and watched closely the movements of the vessel, so that I exactly understood our condition. The vessel was making very heavy weather, riding one huge wave,

plunging through the next as if shooting straight for the bottom of the ocean, and splashing down upon another with such force that her hull would tremble, and with a shock that would sometimes take us off our feet, while a fourth would leap upon us and break far above the turret, so that if we had not been protected by a rifle-armor that was securely fastened and rose to the height of a man's chest, we should have been washed away. I had volunteered for service on the *Monitor* while she lay at the Washington Navy Yard in November. This going to sea in an iron-clad I began to think was the dearest part of my bargain. I thought of what I had been taught in the service, that a man always gets into trouble if he volunteers.

About eight o'clock, while I was taking a message from the captain to the engineer, I saw the water pouring in through the coal-bunkers in sudden volumes as it swept over the deck. About that time the engineer reported that the coal was too wet to keep up steam, which had run down from its usual pressure of eighty pounds to twenty. The water in the vessel was gaining rapidly over the small pumps, and I heard the captain order the chief engineer to start the main pump, a very powerful one of new invention. This was done, and I saw a stream of water eight inches in diameter spouting up from beneath the waves.

About half-past eight the first signals of distress to the *Rhode Island* were burned. She lay to, and we rode the sea more comfortably than when we were being towed. The *Rhode Island* was obliged to turn slowly ahead to keep from drifting upon us and to prevent the tow-lines

* By the courtesy of the Rhode Island Historical Society we are permitted to print the following interesting paper condensed from one of its pamphlets, of which only a very small edition has been published.

from being caught in her wheels. At one time, when she drifted close alongside, our captain shouted through his trumpet that we were sinking, and asking the steamer to send us her boats. The *Monitor* steamed ahead again with renewed difficulties, and I was ordered to leave the wheel and was kept employed as messenger by the captain. The chief engineer reported that the coal was so wet that he could not keep up steam, and I heard the captain order him to slow down and put all steam that could be spared upon the pumps. As there was danger of being towed under by our consort, the tow-lines were ordered to be cut, and I saw James Fenwick, quarter-gunner, swept from the deck and carried by a heavy sea leeward and out of sight in attempting to obey the order. Our daring boatswain's mate, John Stocking, then succeeded in reaching the bows of the vessel, and I saw him swept by a heavy sea far away into the darkness.

About half-past ten o'clock our anchor was let go with all the cable, and struck bottom in about sixty fathoms of water; this brought us out of the trough of the sea, and we rode it more comfortably. The fires could no longer be kept up with the wet coal. The small pumps were choked up with water, or, as the engineer reported, were drowned, and the main pump had almost stopped working from lack of power. This was reported to the captain, and he ordered me to see if there was any water in the ward-room. This was the first time I had been below the berth-deck. I went forward, and saw the water running in through the hawse-pipe, an eight-inch hole, in full force, as in dropping the anchor the cable had torn away the packing that had kept this place tight. I reported my observations, and at the same time heard the chief engineer report that the water had reached the ash-pits and was gaining very rapidly. The captain ordered him to stop the main engine and turn all steam on the pumps, which I noticed soon worked again.

The clouds now began to separate, a moon of about half size beamed out upon the sea, and the *Rhode Island*, now a mile away, became visible. Signals were being exchanged,* and I felt that the *Monitor* would be

saved, or at least that the captain would not leave his ship until there was no hope of saving her. I was sent below again to see how the water stood in the ward-room. I went forward to the cabin and found the water just above the soles of my shoes, which indicated that there must be more than a foot in the vessel. I reported this to the captain, and all hands were set to baling,—baling out the ocean, as it seemed,—but the object was to employ the men, as there now seemed to be danger of excitement among them. I kept employed most of the time taking the buckets from through the hatchway on top of the turret. They seldom would have more than a pint of water in them, however, the balance having been spilled out in passing from one man to another.

The weather was clear, but the sea did not cease rolling in the least, and the *Rhode Island*, with the two lines wound up in her wheel, was tossing at the mercy of the sea, and came drifting against our sides. A boat that had been lowered was caught between the vessels and crushed and lost. Some of our seamen bravely leaped down on deck to guard our sides, and lines were thrown to them from the deck of the *Rhode Island*, which now lay her whole length against us, floating off astern; but not a man would be the first to leave his ship, although the captain gave orders to do so. I was again sent to examine the water in the ward-room, which I found to be more than two feet above the deck; and I think I was the last person who saw Engineer S. A. Lewis as he lay seasick in his bunk, apparently watching the water as it grew deeper and deeper, and aware what his fate must be. He called me as I passed his door, and asked if the pumps were working. I replied that they were. "Is there any hope?" he asked; and feeling a little moved at the scene, and knowing certainly what must be his end, and the darkness that stared at us all, I replied, "As long as there is life there is hope." "Hope and hang on when you are wrecked," is an old saying among sailors. I left the ward-room, and learned that the water had gained so as to choke up the main pump. As I was

* The method of communication from the *Monitor* was by writing in chalk on a black-board which was held up to view; the *Monitor* had no mast on which to hoist the regular naval code used by the *Rhode Island*. As night approached, the captain of the *Monitor* wrote, while we could yet see, that if they were forced to abandon their ship, they would burn a red light as a signal. About ten o'clock the signal was given. When the steamer stopped to allow the hawsers to be cast off the *Monitor* forged ahead under the impetus of her headway, and came so close up under the steamer's stern, that there was great danger of her running into and cutting the steamer down. When the engines of the *Rhode Island* were started to

go ahead to get out of the way it was discovered that the hawser had got afoul of the paddle-wheel, and when they were put in motion, instead of getting clear of her, the rope wound up on the wheel and drew the vessels together. This was an extremely dangerous position, for they were being pitched and tossed about so much by the heavy seas, that if the iron-clad had once struck the steamer they must both have gone down together. However, a fireman went into the wheel at the risk of his life, and with an axe cut the hawser away so that the steamer was enabled to get away at a safe distance.—From a letter to the Editor from H. R. SMITH, then of the *Rhode Island*.

crossing the berth-deck I saw our ensign, Mr. Fredrickson, hand a watch to Master's Mate Williams, saying, "Here, this is yours; I may be lost." The watch and chain were both of unusual value. Williams received them into his hand, then with a hesitating glance at the time-piece said, "This thing may be the means of sinking me," and threw it upon the deck. There were three or four cabin-boys pale and prostrate with seasickness, and the cabin cook, an old African negro, under great excitement, was scolding them most profanely.

As I ascended the turret ladder the sea broke over the ship, and came pouring down the hatchway with so much force that it took me off my feet; and at the same time the steam broke from the boiler-room, as the water had reached the fires, and for an instant I seemed to realize that we had gone down. Our fires were out, and I heard the water blowing out of the boilers. I reported my observations to the captain, and at the same time saw a boat alongside. The captain again gave orders for the men to leave the ship, and fifteen, all of whom were seamen and men whom I had placed my confidence upon, were the ones who crowded the first boat to leave the ship. I was disgusted at witnessing the scramble, and, not feeling in the least alarmed about myself, resolved that I, an "old haymaker," as landsmen are called, would stick to the ship as long as my officers. I saw three of these men swept from the deck and carried leeward on the swift current.

Baling was now resumed. I occupied the turret all alone, and passed buckets from the lower hatchway to the man on the top of the turret. I took off my coat—one that I had received from home only a few days before (I could not feel that our noble little ship was yet lost)—and rolling it up with my boots, drew the tampion from one of the guns, placed them inside, and replaced the tampion. A black cat was sitting on the breech of one of the guns, howling one of those hoarse and solemn tunes which no one can appreciate who is not filled with the superstitions which I had been taught by the sailors, who are always afraid to kill a cat. I would almost as soon have touched a ghost, but I caught her, and placing her in another gun, replaced the wad and tampion; but I could still hear that distressing yowl. As I raised my last bucket to the upper hatchway no one was there to take it. I scrambled up the ladder and found that we below had been deserted. I shouted to those on the berth-deck, "Come up; the officers have left the ship, and a boat is alongside."

As I reached the top of the turret I saw a

boat made fast on the weather quarter filled with men. Three others were standing on deck trying to get on board. One man was floating leeward, shouting in vain for help; another, who hurriedly passed me and jumped down from the turret, was swept off by a breaking wave and never rose. I was excited, feeling that it was the only chance to be saved. I made a loose line fast to one of the stanchions, and let myself down from the turret, the ladder having been washed away. The moment I struck the deck the sea broke over it and swept me as I had seen it sweep my shipmates. I grasped one of the smoke-stack braces and, hand-over-hand, ascended to keep my head above water. It required all my strength to keep the sea from tearing me away. As it swept from the vessel I found myself dangling in the air nearly at the top of the smoke-stack. I let myself fall, and succeeded in reaching a life-line that encircled the deck by means of short stanchions, and to which the boat was attached. The sea again broke over us, lifting me feet upward as I still clung to the life-line. I thought I had nearly measured the depth of the ocean, when I felt the turn, and as my head rose above the water I was somewhat dazed from being so nearly drowned, and spouted up, it seemed, more than a gallon of water that had found its way into my lungs. I was then about twenty feet from the other men, whom I found to be the captain and one seaman; the other had been washed overboard and was now struggling in the water. The men in the boat were pushing back on their oars to keep the boat from being washed on to the *Monitor's* deck, so that the boat had to be hauled in by the painter about ten or twelve feet. The first lieutenant, S. D. Greene, and other officers in the boat, were shouting, "Is the captain on board?" and, with severe struggles to have our voices heard above the roar of the wind and sea, we were shouting "No," and trying to haul in the boat, which we at last succeeded in doing. The captain, ever caring for his men, requested us to get in, but we both, in the same voice, told him to get in first. The moment he was over the bows of the boat Lieutenant Greene cried, "Cut the painter! cut the painter!" I thought, "Now or lost," and in less time than I can explain it, exerting my strength beyond imagination, I hauled in the boat, sprang, caught on the gunwale, was pulled into the boat with a boat-hook in the hands of one of the men, and took my seat with one of the oarsmen. The other man, named Thomas Joice, managed to get into the boat in some way, I cannot tell how, and he was the last man saved from that ill-fated ship. As we were cut loose I saw

several men standing on top of the turret, apparently afraid to venture down upon deck, and it may have been that they were deterred by seeing others washed overboard while I was getting into the boat.

After a fearful and dangerous passage over the frantic seas, we reached the *Rhode Island*, which still had the tow-line caught in her wheel and had drifted perhaps two miles to leeward. We came alongside under the lee bows, where the first boat, that had left the *Monitor* nearly an hour before, had just discharged its men; but we found that getting on board the *Rhode Island* was a harder task than getting from the *Monitor*. We were carried by the sea from stem to stern, for to have made fast would have been fatal; the boat was bounding against the ship's sides; sometimes it was below the wheel, and then, on the summit of a huge wave, far above the decks; then the two boats would crash together; and once, while Surgeon Weeks was holding on to the rail, he lost his fingers by a collision which swamped the other boat. Lines were thrown to us from the deck of the *Rhode Island*, which were of no assistance, for not one of us could climb a small rope; and besides, the men who threw them would immediately let go their holds, in their excitement, to throw another — which I found to be the case when I kept hauling in rope instead of climbing.

It must be understood that two vessels lying side by side, when there is any motion to the sea, move alternately; or in other words, one is constantly passing the other up or down. At one time, when our boat was near the bows of the steamer, we would rise upon the sea until we could touch her rail; then in an instant, by a very rapid descent, we could touch her keel. While we were thus rising and falling upon the sea, I caught a rope, and rising with the boat managed to reach within a foot or two of the rail, when a man, if there had been one, could easily have hauled me on board. But they had all followed after the boat, which at that instant was washed astern, and I hung dangling in the air over the bow of the *Rhode Island*, with Ensign Norman Atwater hanging to the cat-head, three or four feet from me, like myself, with both hands clinching a rope and shouting for some one to save him. Our hands grew painful and all

the time weaker, until I saw his strength give way. He slipped a foot, caught again, and with his last prayer, "O God!" I saw him fall and sink, to rise no more. The ship rolled, and rose upon the sea, sometimes with her keel out of water, so that I was hanging thirty feet above the sea, and with the fate in view that had befallen our much-beloved companion, which no one had witnessed but myself. I still clung to the rope with aching hands, calling in vain for help. But I could not be heard, for the wind shrieked far above my voice. My heart here, for the only time in my life, gave up hope, and home and friends were most tenderly thought of. While I was in this state, within a few seconds of giving up, the sea rolled forward, bringing with it the boat, and when I would have fallen into the sea, it was there. I can only recollect hearing an old sailor say, as I fell into the bottom of the boat, "Where in — did he come from?"

When I became aware of what was going on, no one had succeeded in getting out of the boat, which then lay just forward of the wheel-house. Our captain ordered them to throw bowlines, which was immediately done. The second one I caught, and, placing myself within the loop, was hauled on board. I assisted in helping the others out of the boat, when it again went back to the *Monitor*; it did not reach it, however, and after drifting about on the ocean several days it was picked up by a passing vessel and carried to Philadelphia.*

It was half-past twelve, the night of the thirty-first of December, 1862, when I stood on the forecastle of the *Rhode Island*, watching the red and white lights that hung from the pennant-staff above the turret, and which now and then were seen as we would perhaps both rise on the sea together, until at last, just as the moon had passed below the horizon, they were lost, and the *Monitor*, whose history is familiar to us all, was seen no more.

The *Rhode Island* cruised about the scene of the disaster the remainder of the night and the next forenoon in hope of finding the boat that had been lost; then she returned direct to Fort Monroe, where we arrived the next day with our melancholy news.

Francis B. Butts.

*After making two trips there were still four officers and twelve men on the *Monitor*, and the gallant boat's crew, although well-nigh exhausted by their labors, started for the third time on its perilous trip, but it never reached them, for while all on board the steamer were anxiously watching the light in the turret and vainly peering into the darkness for a glimpse of the

rescuing boat, the light suddenly disappeared and forever, for after watching for a long time to try and find it again they were forced to the conclusion that the *Monitor* had gone to the bottom with all that remained on board. The position of the *Rhode Island* at this time was about eight or ten miles off the coast directly east of Cape Hatteras.—H. R. S. (See page 300.)

DANGERS IN FOOD AND DRINK.

FANCY, if you please, the state of mind of a citizen of New York as to the deceptions and dangers which may exist for himself and his family in the food and drink they consume. That the milk may be watered or skimmed, that the butter may be oleomargarine, or that the sweetening for his buckwheat cakes may be glucose syrup, he has long since learned. Notwithstanding this, he manages to make a tolerable breakfast, only reflecting, as he sips his morning coffee, that not long since he has heard that raw coffees are frequently "painted," as those in the trade term it, with various colors, some of which contain poisons. At his dinner he would like some vermicelli, but he has recently read in the papers of prosecutions in the courts for coloring vermicelli with the poisonous chromate of lead; he would like a salad, but remembers that a few months ago there was a stir about the sale of mustard colored with a poisonous coal-tar color; he would console himself with pickles by way of condiment, but hesitates to swallow what may contain a full medicinal dose of copper compounds; he might slake his thirst with lager beer, but again fears that he will only imbibe copper or lead in another form; an effervescent mineral water might serve as a substitute, but he has been informed that many manufacturers of mineral water in the city use for their wares water contaminated with drainage. In despair, he thinks to refresh himself with ice-cream, but again hesitates, since it is reported that one of the ingredients may be gelatine whitened with zinc white. The good citizen, knowing not which way to turn, experiences a reaction, concludes to take his chances, and eats and drinks heartily, philosophically reflecting on the added significance of the saying, "Let us eat and drink, for tomorrow we shall die."

It is my purpose here to give a brief account of some of the dangers which have been discovered, and, it is to be hoped, materially diminished, by the action of the New York City Health Department during the past few months.

As to coffee: Two forms of treatment have been applied to raw coffee in order to affect the color and general appearance of the bean—"sweating," as it is sometimes termed, and revolving in cylinders. The latter process is termed "polishing" when powdered soapstone or nothing whatever is mixed with the

coffee, and "painting" when mineral pigments are added to change the color. The coffee is usually moistened to soften the exterior; sometimes a little gum arabic is dissolved in the water used.

When coffee was brought here in sailing vessels, requiring a long time for the voyage, the coffee underwent a change in the hold analogous to the sweating process in curing tobacco, or that used in the preparation of some kinds of tea. It is worthy of remark that a decided improvement in flavor is imparted by such a process to articles of the kind. The effect on the coffee was not only to improve the flavor, but to alter somewhat the form of the bean, while the color was changed from a brownish green to a more decided brown. When steamers began to carry coffee, the time of the voyage was too short to permit this sweating process to produce such an effect, and a method of treating the coffee by moist heat (140° to 150° Fahrenheit) was devised, which imitated in some respects the conditions produced in the hold of a sailing vessel. With some coffees this treatment produced a perceptible increase in the size of the bean, as well as the alteration in flavor and tint, and in this way, except in point of color, some South American coffees could be made to imitate the more popular "Java."

"Polishing" was originally practiced, without the addition of any mineral substances, to improve the general appearance of the raw coffee; but it was accidentally discovered that the addition of small amounts of pulverized soapstone effects a much more decided improvement. This led to the use of mineral substances and pigments to affect the color, until now coffee can be "painted" any desired shade by those skilled in this branch, just as one can get from a dyer any desired shade on woven fabrics. A list of the substances used in this "painting" may here find a place: gum arabic; Venetian red; French chalk, or soapstone; Silesia blue; chrome yellow; Prussian blue; turmeric; burnt umber; yellow ochre; drop-black.

The Silesia blue consists of a mixture of Prussian blue and barytes. In the sample examined a small amount of lead (probably there as white lead) was detected. The "drop-black" is ground bone-black. The other names require no explanation. Of these

colors only chrome yellow (chromate of lead) is *per se* poisonous. The ochres, however, are sometimes the product of the weathering and decomposition of pyrites containing arsenic or copper, and those elements can frequently be detected in them. In the colors examined, only the burnt umber showed arsenic; still, in consequence of careless handling, poisonous materials sometimes get mixed with the substances used.

The use of colors containing poisons for "painting" coffee has been forbidden, and to a large extent stopped by the prompt action of the Health Departments of New York and Brooklyn. Although the aggregate number of pounds of coffee thus treated is no doubt very large, the proportion to the entire amount of coffee sold has been small, and in cases of "painting," as has been seen, but few of the colors have poisonous constituents. Nevertheless, so long as buyers of raw coffee follow the older traditions, depending upon color as their guide, and

"Do not care for dirty greens
By any means,"

or the reverse, some encouragement is given to these practices in defiance of the law, and only the enlightenment of buyers to suit the changed conditions of the coffee-trade can effectually stop "painting." At the present time the most expert buyers depend very little upon color, but judge of the samples by the appearance and aroma of the roasted beans, and the flavor of the infusion.

The coloring of vermicelli with chrome yellow seems to have come about in this wise: A large proportion of our population, chiefly Germans, are very fond of what they term "Eier Nudeln," a yellow vermicelli, the color being supposed to be imparted by the admixture of eggs with the flour used in the manufacture. Some unscrupulous manufacturers, having found that for their trade a yellow color in the vermicelli was sufficient to work upon the imaginations of their customers, omitted the expensive egg, and added instead some yellow coloring material. Turmeric, Martius' yellow (a coal-tar dye), and chrome yellow (chromate of lead) are colors which have been used. The last is by far the most dangerous addition, and at least one case of lead-poisoning in this city has been traced directly to this source. In some families the custom of making the nudeln at home prevails, which is certainly a safe plan. In some cases the manufacturers were most probably ignorant of the properties of the yellow coloring matter (chrome yellow) which they used. They simply used the material because other manufacturers did, and they

found a sale for goods so colored. It is to be hoped that, in consequence of the publicity which has been given to this matter, this form of danger may soon become a matter of history only.

Some persons imagine, when they buy mustard from a grocer of good standing, that they are receiving only the flour of mustard-seed, after grinding and bolting. They are almost invariably mistaken. If they were given what they supposed, the article would most probably lack the bright color to which they are accustomed, since the flour or farina from the four or five different kinds of mustard-seed now in the market has in but one or possibly two cases that brilliant tint; as a condiment, the genuine mustard flour would be thought to be too sharp and bitter, and as an ingredient in mustard plasters, it would be unendurable. It is also asserted that pure mustard farina does not keep well. What is ordinarily sold under the name of mustard is a mixture of mustard farina—after partial extraction of the oil—with flour or starch and turmeric; and this method of preparing the condiment has become so general, that it is not regarded as an adulteration by the manufacturers. By regulation of the New York State Board of Health, of March, 1883, manufacturers of mustard are allowed to add sixty per cent. of flour and turmeric to mustard farina, provided that fact is distinctly stated on the label of the package. These additions are not harmful. Turmeric is itself a condiment, being a constituent of the well-known curry-powder. Its physiological effects are described by the United States Dispensatory as similar to those of ginger.

A few months since it was discovered that some manufacturers were not only using in their lower grades of mustard excessive quantities of flour, but were replacing the flour in part with terra alba, and were substituting for the turmeric a coal-tar color—Martius' yellow, scientifically termed "calcium dinitronaphthalate." This color, besides being as explosive as gunpowder when unmixed with anything else, was proved by experiments on dogs to be poisonous.

That copper compounds have frequently been used to give a bright green tint to pickles and preserved green vegetables generally has long been known. It may perhaps not be known that minute quantities of copper have been found in almost all vegetable products, apparently as an accidental constituent, since the amount varies according to the soil upon which the cereals, potatoes, etc., have been grown, and the element is sometimes entirely absent. In an experiment connected with this investigation, copper to the extent of 2.57 parts of the

SECTION OF THE STRATA UNDERLYING PARIS AND ITS ENVIRONS. HORIZONTAL SCALE, EIGHTY MILES TO AN INCH. VERTICAL SCALE, TWO THOUSAND FEET TO AN INCH. (FROM HUMBER'S "WATER SUPPLY OF CITIES AND TOWNS.")

metal per million was found in fresh cucumbers bought in market. In some mollusks, and in the coloring matter of the feathers of certain tropical birds, copper is an essential constituent; it has frequently been detected in the human body.

The question as to whether copper compounds are really poisonous has been vigorously disputed, and cannot be regarded as positively settled. It seems probable that to certain persons, possibly the larger proportion of mankind, they are poisonous, while to others they are not.

The westerner who visits this city on business or pleasure may "forget to taste" the Croton water; but how would he feel if he were told that the sparkling effervescent water which he drank with his claret at some fashionable club, even though it bore some well-known foreign brand with the label and cork-fastening looking as though the bottle had just come from abroad, was water drawn from a well sunk on Manhattan Island, and was contaminated with the drainage of some of its busy streets and leaky sewers.* Yet that has been often the fact.

The assertion that New York wells are liable to be bad has been received with skepticism on the part of some. Artesian wells sunk in Paris or London yield good water, it is said; why not those in New York? In the first place, it must be said that the wells on this island, from which many manufacturers of effervescent waters draw their supplies, are not artesian wells; and in the next, that most of them are shallow, varying in depth from but little over twenty feet to seventy-five or eighty; and still further, that the geological formation of our island is such that we cannot expect to draw from these wells any other water than that which has soaked into the ground not

very far from where the well is sunk. A glance at the illustrations will make this clear. London and Paris both happen to be situated in geological basins, and stand on an impervious clay; and wells sunk in those cities which failed to penetrate to the strata below have frequently been proved to be centers for the propagation of disease.

The tendency of subterranean water is to follow the trend of the strata, especially when the strata have been bent. An artesian well in Paris or London, then, when sunk into the strata forming the basin, will draw not from the surface immediately above, but from the supplies which have filtered through the upturned edges of the strata on the hills outside those cities. Manhattan Island, on the other hand, is, so to speak, all "upturned edges." The strata, originally deposited horizontally, were in some past age thrown into sharp folds. Subsequently, a glacier moved across the surface, grinding off the tops of the folds, and filling the hollows with débris. The lower part of the island, below Fourteenth street in some places, and up to Twentieth street or higher up in others, is more or less deeply covered with similar débris. The western end of Long Island is the terminal moraine of that glacier. "Glacier scratches" are still to be found on the rocks at the upper end of the island. The strata stand nearly vertical, in some places dipping to the westward, in others to the eastward. The "strike" or direction of the edges is nearly parallel to the avenues. The consequence is, that wells sunk in the glacier débris fill up from the water which reaches the ground in the immediate neighborhood, while those sunk into the rock receive the water which has worked its way through the slanting strata from a short distance to the eastward or westward of the

* At one time the sewers of New York were built without being closed at the bottom—to all intents and purposes an arch resting upon the earth below, affording the best possible opportunity for the liquid contents of the sewer to soak into the soil. Some sewers of this pattern still exist in the lower portion of the city.

point where the well is sunk, according as the strata dip to the west or east at that point. Wells sunk near our water fronts where the dip of the strata is favorable, even when a thousand feet deep, will yield salt water. The sharp contortion of the strata by fissuring or cracking them along the lines of weakness are aids to the production of these results.

Water can no doubt be purified by filtration through a mass of soil and rock, but the surface water of New York city, containing as it does so much that is, to say the least, objectionable, would require a long journey through rock and soil to make it fit for use; so that a depth of two thousand feet for a well, even if surface water were excluded (which is seldom the case), if we consider the constant accumulations in our streets, would probably be insufficient.

It must not be rashly inferred from the items which from time to time are published that *everything* which we purchase in the way of food and drink is bad or adulterated. Probably if the proportion of adulterated articles to the whole number of sales, say in a day, a month, or a year, could be calculated, it would be found to be small; and if those articles which were really dangerous or had received dangerous additions were only reckoned, the proportion would be still smaller. People may be horrified to read that of more than six thousand samples examined in the Paris municipal laboratory last year, over fifty per cent. were found to be bad; but an important point must not be overlooked. Chemists, or, as they prefer to call them in England, "analysts," do not frequently examine an article of food except to confirm or disprove a suspicion that it is "no better than it should be"; as a consequence, the percentage of adulterations discovered is usually high. In other words, the "analyst" is apt to see the worst side of the question.

It is unfair in the extreme to assume that all dealers are dishonest, or that if they have a choice they will invariably prefer to adulterate with the most deleterious substance obtainable. What is at the bottom of all this is a desire for gain, and results from innumerable causes. Some manufacturers and dealers endanger the health or the lives of their customers through sheer ignorance, and take the same risks themselves without being aware of it. They imitate the practices of other manufacturers so as to be able to compete with them, and only know that their goods are marketable. Questions of casuistry do not trouble them. Adulteration is supposed to embrace the element of fraud, yet, more frequently than is supposed, fraudulent intentions are absent. The moral standards of men also are variable. One man considers anything moral which is not illegal; another goes a step farther, and regards any act of his as consistent with morality, provided he doesn't get caught. Adulteration is sometimes technical, rather than actual. For

instance: some grocers buy strong vinegar, and dilute it to the point which they find their customers prefer. In Massachusetts, if vinegar contains less than five per cent. of acetic acid, it is regarded as adulterated. In England, three per cent. is the limit. If now a grocer should dilute his vinegar so that it contains but four per cent. of acid, it would be adulterated in Boston, and not adulterated in London.

The general laws of the State of New York are so constructed, or interpreted, that *injurious* adulterations or additions to food are illegal, while the plea of ignorance is seldom, if ever, accepted as a bar to conviction in the courts, though it may have weight when sentence is pronounced. Our citizens must be protected from the ignorance and carelessness as well as from the dishonesty of dealers in articles of food and drink. The law rightly assumes that dealers have sufficient acquaintance with articles in their line to be able to distinguish between what is good and what is bad.

Elwyn Waller.

AT MRS. BERTY'S "TEA."

"THANKS, yes, with pleasure. It's awfully good of you, Mrs. Berty. She's charming; quite the prettiest girl in the room, I should say."

"Miss Malbrook, permit me to present to you Mr. Widdle. Mr. Widdle has been everywhere, my dear, even in Japan. No doubt he can give you, out of his Japanese experiences, a great many valuable hints in regard to your china painting."

"Oh, how very interesting. I always have wanted to travel in the far East. Was it *very* queer, Mr. Widdle?"

"Ah, exceedingly, I assure you. Mrs. Berty tells me that your china painting is charming. Indeed, she has shown me that lovely vase—with the violets on the crimson ground, you know. It is positively delightful. Isn't it a dreadfully difficult sort of thing to do?"

"No, not difficult, at least not very; but dreadfully bothersome. The paints dry so, you know—that is, when you don't want them to dry; when you're done, and want to fire, then they just never dry at all! And then, one has so many interruptions in one's work. Really, I assure you, several of my very nicest things have been spoiled in just that way."

"Yes. It's beastly to be interrupted. Puts one out so, you know. I remember once

being interrupted in a murder — Mayn't I take you out to the tea-room?"

"Thanks. I do want a cup of tea. Mrs. Berty always has such good tea, you know. I beg your pardon. In a murder, did you say, Mr. Widdle?"

"Yes; it was awfully annoying, I assure you."

"Yes?"

"Yes. You see the circumstances were a little trying, any way. It was my grandfather, you know — These are shockingly awkward stairs, aren't they?"

"Dreadfully. I wonder why Mrs. Berty will keep on living in this old-fashioned house. Your grandfather?"

"Quite an old gentleman, you know. In his youth he had been strikingly handsome, and as an old man there was an imposing grandeur in his presence that I never shall forget."

"I can very well believe you, Mr. Widdle."

"Ah, you are quite too good. Mrs. Berty has told me how very good you are. Thank you very much indeed. Yes, he was a grand old man. For all his seventy-one years he was erect and vigorous. His snow-white hair and beard flowed in great masses about his head, giving him a positively leonine appearance. His dark eyes shone brilliantly beneath his shaggy gray brows. His voice was rich

and full. I was very fond of my grandfather, I assure you, Miss Malbrook, and that I had to murder him really tried me a good deal."

"It must have, I'm sure."

"Thank you. You are very good to be so sympathetic. Yes, it really did. But I had no choice in the matter, you know. I was determined, though, that I would make the murder as pleasant for him as possible. Do you take sugar and cream?"

"Yes, thanks. Only one lump, please."

"I thought over the matter a good deal, and I finally concluded that probably the most agreeable way to him would be to kill him in his sleep. Is it quite right? May I not give you a little more cream?"

"No more, thanks. It is delightful."

"The way in which we lived at the time made this, also, the most practicable method. My grandfather occupied the suite of rooms in the west wing, and my own apartments were over his on the floor above. In my great-grandfather's time these upper rooms had been used as a laboratory,—my great-grandfather was an amateur chemist of considerable celebrity for the period,—and a stairway had been constructed that led directly from my grandfather's room to my own. This stairway now was disused, and the lower door was locked. I took occasion, while my grandfather was taking his daily drive, to remove all but one of the screws which held the lock in place. This one I took out, oiled, and then returned. The door still was firmly closed, but in five minutes I could draw the screw noiselessly, lift off the lock, and have the way clear. My grandfather, who was in excellent health, was a heavy sleeper; a fact that I had counted upon, both for his convenience and my own, in laying my plans.

"Everything being thus satisfactorily prepared, I waited the approach of night with a considerable degree of impatience. My grandfather and I, as was our usual custom, dined together very pleasantly. He was a most agreeable old gentleman, with a quite surprising fund of general information and a very happy faculty for telling a good story in a pleasant way. I remember that night he gave me a very interesting account of one of his adventures in Paris with Washington Irving. They both were young men at the time, of course,—it was when Irving first went abroad, you know, in thirty something,—and —"

"You would rather hear about the murder? It's very good of you to say so, I'm sure. Really, the story scarcely is worth telling. But if you like it—of course. We had a very pleasant dinner, as I was saying, and I tried to do what I could to be agreeable to my

grandfather. Since it was to be his last dinner, I really wished him to enjoy it; and I think he did. The old gentleman and I always got along very nicely together, for he was sincerely attached to me—as I certainly was to him. I assure you, I never have met a more delightful old man than my grandfather was. There was a courtly grace and ease in his manner that always reminded me of that of a French nobleman of the last century. Yet with all his courtliness he was genial to a degree. There was a benevolence in his disposition, a tenderness in his nature, that endeared him to every one with whom he came in contact. Of course, knowing him as intimately as I did, I positively idolized him!

"How I must have grieved for him after he passed away? Indeed I did, I assure you. Often and often, even now, do I think of that dear old man and long to hear his kindly voice again.

"When we had finished our wine—my grandfather never drank heavily, but his wines were of the best—we separated for the night. My grandfather always went early to his apartment, but usually sat late over his books. I also retired to my quarters, and made the trifling preparations yet to be attended to. I wished my work to be done noiselessly, as no doubt you will readily understand."

"Certainly."

"With this end in view I had already provided myself with a stiletto; but as I deemed it more prudent to stun him before delivering the fatal blow—— Do let me get you another rasped roll."

"Thanks. No, not a sandwich, thanks."

"—— to stun him before delivering the fatal blow, I looked about me for something that would answer the purpose of a heavy club. In a closet I was so fortunate as to find an old air-pump, a part of my great-grandfather's philosophic apparatus, and the long heavy handle of this was just what I required. I detached it carefully, so that it might be returned without injury to the air-pump, and laid it upon the table beside the knife. Then all was ready; I had only to wait until my grandfather slept.

"As you may suppose, I found waiting dreadfully tedious. Fortunately, though, I had that clever story of Crawford's, 'Mr. Isaacs,' you know. Don't you like it *very* much, Miss Malbrook? What a fine scene that is where they play polo! I'm really quite devoted to polo. I remember a match that I was in last summer that was the most tremendously exciting thing that I ever had anything to do with. My side——

"Oh, I beg your pardon, the murder? Yes, I had to wait for several hours, you know. It

was a regular bore. At last, however, I heard some slight sounds in my grandfather's rooms — of steps, of a chair being moved, once of his voice a little raised as he petulantly rebuked his man for some piece of stupidity — and then I heard his door close as his man retired, and presently all was still. To make quite sure that he slept, I waited while I smoked a *regalia*.

"Do you know, I have rather a fancy for measuring the flight of time in odd ways? One of the poet fellows, you know, says something about how 'the dancing hours' are 'measured by the opening and the closing of the flowers.' Pretty idea, isn't it? I'd like to do it that way too; but a man cannot carry a whole conservatory around with him, you know. So I do it with cigars — *Conchas* for the quarters, *Londres* for the halves, and *regalias* for the whole hours. You have no idea how precisely it works when once you get into the way of it.

"When my cigar was finished I knew that the hour must be up, and as all remained still below, I proceeded to my work without further delay. Putting on the list slippers with which I had provided myself — If you are troubled with cold feet, Miss Malbrook, you will find list slippers really delightful. I mention them because, unless you should chance to require them as I did, you might never think of them; and they are the greatest comfort, I assure you. Putting on my slippers, and taking the stiletto in my hand and the handle of the air-pump under my arm, I went down the narrow stairs noiselessly. I had a screw-driver in readiness in my pocket, and, having struck a match, I had no difficulty in removing the well-oiled screw. I laid the heavy lock softly on the stairs behind me, softly pushed open the door, and so stood in my grandfather's bedchamber. The curtains were pushed back from the high windows and a flood of moonlight poured into the room — a brilliant ray striking full upon my grandfather's face and snowy beard and hair as he lay wrapped in peaceful sleep. Never had he appeared to me so strikingly, so majestically handsome as he was then; never had the gracious benevolence of his gentle nature shone out more clearly than it shone out then from his placidly beautiful face revealed to me there in the soft moonlight.

"Ah, have you ever heard, Miss Malbrook, that it isn't wholesome to have moonlight shine on you when you're asleep? Some people say it isn't, you know. But I don't see what harm there can be in it, do you? I'm sure it must be a mistake, for my grandfather slept that way for years, and it certainly didn't do him the least bit of harm. As I have told you, for his age

he was a most extraordinarily vigorous man. I couldn't help thinking at the time that his case quite upset the theory; and as I knew his taste for scientific research of all sorts, I was sorry that I had not thought sooner to obtain from him his opinion in the matter. However, it now was too late.

"Grasping the stiletto firmly in my left hand, and holding the handle of the air-pump, ready for vigorous use, above my head in my right, I stole cautiously across the moonlit floor until I stood close beside the bed. My grandfather's sleep was deep and tranquil as a child's. Indeed, he could not have slept in a more entirely satisfactory way. I could not repress an exclamation of thankfulness, for his sake, that he slept so well. Planting my feet firmly, I tightened my grip upon the handle of the air-pump, and then brought it down — Let me give you an ice now. This frozen coffee is delicious. Clever idea to freeze coffee, wasn't it? Oh, I *beg* your pardon. It didn't spill, I hope. No? How glad I am.

"The effect of the blow was admirable. My grandfather was thoroughly stunned in the nicest possible sort of way. Of course, I had had very little practice at this sort of thing then, and I was a good deal pleased to see how nicely my work was done. I hope that you won't think me very vain, Miss Malbrook, but I really can't help being a little proud of the way that I easily do things at sight which most people find quite hard to do even after a good deal of study and practice. I don't mean in just this one instance of murdering my grandfather, you know, but in a whole lot of things. It was just the same way, for example, when I began to play jack-straws. I played a good game from the very start, I assure you. And jack-straws is a very difficult game to play well, you know. To be quite fair, though, I must admit that in this murder matter my lawn-tennis practice was of great service to me — made me strike straight and hard, you know.

"Don't you like lawn-tennis, Miss Malbrook? I am ever so fond of it. It's such capital exercise, you know — a great deal better than croquet ever was. Isn't it queer how completely croquet has gone out? Nobody plays it, and you never even hear of it now. I remember when I was quite devoted to it. It was my grandfather, by the way, who gave me the first set of croquet that I ever owned. He and I used to play together on the lawn for hours at a time. I was quite a little fellow then, you know, and I remember my mother used to say that it was ever so pretty a sight to see us two — 'Youth and Age,' as she used to call us — playing that way together. My grandfather always was very kind to me. I

was his first grandchild, you know, and he took a great pride in me and was ever so fond of me from the very day that I was born.

"Oh, about my killing him? As I was saying, the blow stunned him beautifully. The handle of the air-pump was a desperately heavy affair, you see. After this there remained only to finish my work with the stiletto. I raised my arm to strike again—and just then there was a knock at the door! It was this, you remember, that made me think of the whole matter when you spoke of how annoying you found interruptions in your china painting. I know just how it must make you feel. It was very absurd, of course, but the interruption really made me quite angry. Could I, at the moment, conveniently have spoken to the person who was knocking, I am afraid that I should have said something quite unkind, really quite harsh, you know. But I could not very well open the door just then, nor did I altogether like to continue the matter in hand until the person who had knocked had gone away. I remained quite still, therefore, in the hope that the knocker would conclude that my grandfather was asleep and would be too polite to make further effort to wake him. But this hope was unfounded. There was another, louder knock; and presently one louder still. It was very displeasing, I assure you. Obviously, I had to act in some way that would bring this annoying interruption to an end. Simulating my grandfather's voice, therefore, I cried out in a sleepy tone:

"'What's the matter?'"

"'If you please, sir,'—I recognized the voice of my grandfather's valet,—'the house is on fire.'"

"'Clear out!' I replied testily—and made a motion with the pillows like that of a man settling himself to sleep again. My grandfather, I should observe, while most gracious in his manner at all times when thoroughly awake, was apt to be a trifle short in his temper when aroused suddenly from sleep.

"'Very good, sir,' the man answered, and I heard his steps retreating down the passage. My grandfather made it a rule to require from his servants implicit obedience.

"Unfortunately, in shaking the pillows about I had dropped the stiletto, and I had

ever so much trouble in finding it again. Somehow it had managed to work down under my grandfather in the bed, and the contact of the cold steel with his person aroused him a little. He moved slightly, and for a moment I feared that I should be compelled to use the handle of the air-pump again. Fortunately, though, before this became necessary I found the stiletto, and once more held it aloft to strike. The slight movement that he had made had placed him in a most favorable position, and I struck with all my force——

"Oh, I beg your pardon. I did not see that your plate was empty. How careless I am! Pray let me get you something more. No? Then permit me to take you back to the drawing-room. The crowd is dreadful here, and people push so. Don't you think that people are dreadfully rude about their eating at teas? Positively, they fight over their food quite like wild animals. Oh, I beg your pardon. I hope that I haven't torn it. No? I am ever so glad. I am an awfully clumsy brute, and it is ever so nice of you to be so nice about it. At Mrs. Welterton's, yesterday, I positively assure you that Miss Ruddle—the pretty Miss Ruddle, you know, not the freckled one—had her skirt almost torn to pieces by that horrible Reggy Smith. I'm not quite as bad as that, any way.

"About my grandfather? Oh, really, there is nothing more to tell; indeed, I'm quite ashamed of myself for having bored you with such a long story about such a trifle. It was only that you happened to speak about being interrupted, you know. Of course, after the man went away I had no further trouble. I killed my grandfather very comfortably and satisfactorily; and as the house was quite burned down within two hours,—I think I forgot to tell you that I set fire to it before I went at the other work,—the whole affair was glossed over very nicely.

"You must go now? I'm really very sorry. Thank you so much for the very pleasant half hour that I have had. And I do hope that I shall have the pleasure of seeing some more of your lovely china painting soon, Miss Malbrook. Really, I quite adore it, you know."

Thomas A. Janvier.

TOPICS OF THE TIME.

Mercantilism Transfigured.

IN that most significant speech made two years ago by President White of Cornell to his classmates at Yale, and entitled "The Message of the Nineteenth Century to the Twentieth," the influence on our national life of what the orator aptly describes as "mercantilism" is most cogently set forth. This "combination of the industrial spirit with the trade spirit" has been, as he shows, the dominant element in our American civilization; under its sway there has been a marvelous development of the physical resources of this country, but along with this a too evident decline of the higher forces. The genuine political spirit, the devotion to the public service which leads the citizen to give time and thought to the affairs of the city or the state, has been gradually dying out. Men are so consumed with business cares that they find little time or strength for public service. In education and in the cultivation of pure science progress has been made, no doubt; but how little compared with the enormous increase of the national wealth! In literature and art the movement, as he views it, is retrograde; and a good proportion of our foremost pulpits are supplied by importations from the Old World. Mercantilism is drawing into its vortex the intellectual strength of the nation. The energies of its most promising young men are enlisted in the pursuit of wealth. Such is the complaint of his own generation made by a man who is by nature an optimist, but who is a careful student of history and a close observer of the manners of his time. "I believe," he declares, "that we shall find that, so far from relatively diminishing, it [mercantilism] is relatively increasing; that, so far from begetting better elements of civilization, it is now beginning to stifle them; that it is now beginning to show itself a despotic element, crushing other elements of civilization which are to add anything to the earth's history; that, in fact,—and I say it in all soberness,—mercantilism in great cities and in small towns, in society and in the individual, is becoming a disease, certainly feverish, possibly cancerous." To those who are not too busy with money-making to think much about it, this judgment of existing social conditions will appear to be sane and moderate.

But these words of faithful warning and reproof are not words of despair. The orator expects that these ruinous tendencies will be checked; that other forces will be evoked to counteract mercantilism, and to prevent the "weakening, decline, and sterility" toward which it is hurrying the nation. His own prediction of the quarter from which deliverance will come we shall not here repeat; because we desire to make record of a most hopeful answer to the question which he raises, contained in another speech no less significant—an address by Mr. Franklin MacVeagh of Chicago, at a dinner given by the Commercial Club of Boston to its guests from the three chief cities of the West.

The manner of this speech as well as the matter of it commend it to all lovers of good literature. After-

dinner oratory is not often so graceful; its delicate wit, its bright allusions, and its deftly turned sentences exhibit a mind of fine grain and careful culture. It would be hard to find a professional talker, East or West, who could put his thoughts into better form. Evidently here is one man who, though he proclaims himself a trader, has contrived to extract some sweetness from the barren pastures of mercantilism.

But the art of the performance does not hide its purpose. The business man's responsibility to society is the serious theme on which he finally lights; and the view which he takes of the matter leaves nothing to be desired by patriot or philanthropist. The estimate of the trader's function here laid down, if it were accepted by all business men, or even by the better part of them, would speedily correct those evil tendencies of which Mr. White has warned us. The Chicago trader protests, indeed, against the undue disparagement of the mercantile vocation. "Trade," he says, "is a much-abused benefactor. It would not do to take seriously the foppish views of trade held by the idle end of society. To them nothing is dignified but idleness. This mediæval survival of prejudice is chiefly cherished by the useless part of the nobility and their admirers in America,—by that part of the *noblesse* whom the English wit must have had in mind when he made his classification of 'the men of a-bility and the men of no-bility.'"

The dignity of any calling depends first on its aims, secondly on the qualities developed in its pursuit. "Let us frankly admit," this orator goes on to say, "that the aims of trade have not been all that they might have been. But what, on the other hand, shall we not claim for those high qualities of mind and character, for the untiring enterprise, the wise judgment, and the undaunted courage that from the very beginning of history have made commerce the bearer of civilization from every center to every circumference; that made her the origin of cosmopolitan life, the solvent of the antagonisms of custom, the necessary foundation for every enlargement of the life of nations? And shall we not now claim that the ideals, the aims of trade are widening and deepening? Is it not true that men more and more are associating with the dream of wealth a sense of public responsibility and an aspiration for public usefulness? And is it not true that the good works of the nation largely depend upon the intelligent sympathy and coöperation of business men?"

If these last questions can be confidently answered in the affirmative, the future of this nation is secure. And it is certainly a good sign that from one of our chief centers of business activity should come so full and strong a statement of a doctrine that offers a solution of the gravest questions now before us. We quote in full the next two paragraphs of this noteworthy speech:

"It is a great temptation, Mr. Chairman, now that I have gotten so far on the way, to go ahead and claim

that we men of affairs are altogether perfect. But a reluctant honesty obliges me to confess that before we shall be quite all we might be to the world, wealth must be sought still more generally for its good uses. Of course men must be left free to accumulate property for their own purposes. A form of society which should prevent the free accumulation and possession of property would simply stagnate progress, and is impossible. But, on the other hand, it is not difficult to believe that the avenues to exceptional wealth can only be held by the few, as at present, through the intervention of important concessions to that spirit of democracy which is entering upon a new stage of its mastery of the world; for democracy, after all, is not more a governmental revolution than it is a social revolution. The greatest concession, it seems to me, that will be demanded of wealth by democracy—a concession that will answer the demands of progress as well—will be the frank acknowledgment of a moral trusteeship, of a moral obligation to freely use surplus wealth for the general good.

"Happy the necessity, beneficent the tyranny that will thus rule trade and wealth to their own glorious enfranchisement. When such an acknowledgment is generally made, wealth and trade shall be lifted up to the level of the highest and the best. Once inspire trade with such an aim,—free wealth from its spiritual bondage through this great ideal, give to all the pursuits of business such a right royal sanction that they shall take rank and dignity with all the work that is done by humanity in its best estate, with poetry, with every form of literature, with every form of art, with statesmanship, with apostleship,—Cræsus hugging his millions to his bosom as his own, in the narrow sense of ownership, rejecting the idea of trusteeship, will be overwhelmed in the rush of the current of modern ideas; Cræsus accepting the idea of trusteeship will be the new force in civilization for which the world is waiting."

We ask whether there be not condensed into these two paragraphs from the speech of a Chicago "trader" more solid statesmanship, more true insight into existing social conditions, a wiser solution of the greatest question of our time, than was contained in all the stump speeches of the last presidential campaign. The prediction here uttered respecting the challenge which a militant democracy will soon be flinging at the feet of a too confident plutocracy is one that may well be heeded. And the answer that Mr. MacVeagh proposes to make is the right answer. Such a recognition of moral trusteeship as he urges will pluck the sting from socialism, and save to the world the fruits of enterprise. Mercantilism, transfigured through these higher aims, will cease to be the peril of the state, and become its protection and defense.

The Sunday-school and Good Literature.

WHATEVER may be said of the moral and religious aims of the Sunday-school, it is evident that its relation to the literary life of the young must be of considerable importance. That it has much to do with the formation of the literary taste of a good share of the people who read is obvious. This function of the Sunday-school is, of course, subordinate to its work of moral and religious education; nevertheless, the two objects are closely related, and the building of character may be greatly helped by good habits of reading and good taste in the selection of books; while the foundations of character are often undermined by the reading of foolish and worthless books.

If, then, in imparting to its pupils the necessary knowledge of religious truth and the fundamental laws of Christian morality, the Sunday-school can also contrive to instill into their minds a healthy craving for good literature, its service will be twice blessed. That it has done something in this direction cannot be doubted, neither can its neglect and its misdoing be denied.

The Sunday-school library furnishes to a large number of the children of this country the only books save their school-books that they are permitted to handle. Cheap story-papers of one sort or another make their way into most of the homes in which these children live; but books would not often be seen in them if it were not for the Sunday-school library. If these libraries were always well chosen, many children would be guided by them into the formation of habits of reading which would prove through all their lives a safeguard and a solace. If the books which they find in these libraries are, as a rule, silly and shallow fictions, their intellectual tastes may be so depraved by their reading, that they will become visionary and restless creatures, wholly unfit for the serious business of life. That a book should be hurtful to young readers, it is not necessary that it should teach bad morals; the mischief is done quite as effectually by an overwrought sentimentalism as by a lax morality. All this is merest commonplace, but it is one of those commonplaces that need to be dinned into the ears of the people who provide reading for the young. How far many of the managers of the Sunday-schools are from comprehending it may be learned by an inspection of the shelves of the Sunday-school libraries. The trashy fiction still disseminated through them is sufficient to addle unnumbered brains and injure unnumbered lives.

The flood of silly literature has, however, begun to abate in this quarter, and the existing libraries are much superior to those in use twenty years ago. The censor has been abroad among the Sunday-schools, and his strictures upon their methods have not been wasted.

The Sunday-school hymns, for one thing, are greatly improved. The doggerel that was rife a few years since has been laughed out of the churches; the hymns now printed, though not always of a high poetic order, are generally free from that rattling vulgarity which was formerly in vogue. That the tastes of the children, as well as their devotional feelings, may be greatly cultivated or grievously depraved through the hymns they sing needs not to be said; and the improvement noticeable in this department is matter of encouragement. There is no reason why children should not be taught, through the Sunday-school hymnology, to appreciate good poetry.

Many of the libraries also, as we have said, have been subjected to a careful scrutiny, and the trashy books have been eliminated. Several years ago an association of teachers and librarians, connected with the schools of the Protestant Episcopal churches, began the preparation of a list of Sunday-school library books, into which no volume was admitted that had not been carefully read and approved by several persons of sound literary judgment. This list has been extensively sought and used by Sunday-schools in other communions, and it has determined the selection

of many libraries. Other lists of a similar character, more or less judiciously made up, have been offered to the public. All this indicates a quickened sense of the importance of this matter, and promises a general improvement in Sunday-school literature. The most ambitious project of this nature is a recent proposition to form an association of Sunday-school librarians and others interested in the support and improvement of church and Sunday-school libraries, which shall have annual meetings, with reports and discussions of the best methods of selection and management. The secular librarians, though far less numerous, have such an association and are greatly helped by their conferences; it is urged that similar coöperation among Sunday-school librarians would be equally useful.

There is one other department of Sunday-school literature in which the censor should at once be let loose. The quarterlies, the leaflets, and the various lesson-helps call aloud for his judgment. Whatever may be said about the theology or the religion of these contrivances, it is certain that good literature is a heavy loser by the quiet revolution which has practically banished the Bible from the Sunday-school, and substituted for it the lesson-helps. It is true that bits of the Bible are printed upon these scrappy commentaries, but it is only a small part of it that the average Sunday-school scholar ever sees; and the habit of handling and reading the sacred Book seems to be much less common now than it was twenty years ago. Such familiarity with its contents as John Ruskin gained and Matthew Arnold commends was by no means uncommon when these two were boys; and the loss to the children of this generation of this noble instrument of literary culture cannot be computed. "The pure and the noble, the graceful and dignified simplicity of language," said Alexander Pope, "is nowhere in such perfection as in the Scriptures and in Homer." What Carlyle says of the Book of Job is hardly less true of many other parts of the Bible: "A noble book! All men's book! It is our first, oldest statement of the never-ending problem—man's destiny and God's ways with him here on earth; and all in such free, flowing outlines, grand in its sincerity, in its epic melody and repose of reconciliation. There is the seeing eye, the mildly understanding heart, so true every way; true eyesight and vision for all things, material things no less than spiritual." The practical banishment of this book from the Sunday-school can hardly be a gain to religion; certainly it is a loss to literature. Daily familiarity with the noble simplicity of the Bible would prove an excellent corrective of vitiated taste, and a healthy stimulant of pure imagination.

But the lesson-helps become a detriment to literature, not only by discouraging the familiar handling of the Bible, but also, in many cases, by the extravagances of their own composition. Especially is this true of the illustrations by which they seek to "explain" the lesson. A pile of these absurdities lies before us from which it would be easy to cull many delectable instances. Most of them occur in connection with the object lesson, presented on the blackboard or otherwise, so that pictorial as well as literary art suffers from their dabbling. Thus in one of these "helps" the topics of the lessons for the quarter are so phrased that each one begins with the letter B, and the following instruction is given: "At the opening of the first lesson, ask the class if they would like you (*sic*) to show them a picture of a whole hive of pretty bees. . . . Tell them you are now going to put your first *bee* on the board—a bee with a pretty sharp sting, too, may be, for some of them, and write out the teaching." The propriety of training the present generation in the arts of the punster may well be called in question. After a parable of two climbing vines, the teacher is admonished to "draw a red heart with a few curly green tendrils running out from it," and then enforce the lesson of personal attachments, harmful and helpful. To show "that anything can be made an idol by being loved more than God and his service," the teacher is instructed to "draw a fishing-pole and line in a heart." To illustrate fidelity to God the following object lesson is suggested: "Cut *two hearts* just alike, and mutilage them; then in class stick them together and notice how they cling together, how they have become as *one*; so *stick* to God." The italics are not ours. To teach children what an abomination to the Lord is, "first offer a child a bottle of cologne to smell, and immediately afterward a piece of asafetida or gamboge."

It is scarcely necessary to particularize further. Many of these illustrations are so gross and ludicrous that we shall not repeat the sacrilege by quoting them. It is enough to say that in the craze for illustration with which these lesson-helps are afflicted, that wise law of literary art which forbids the linking of sacred and sublime themes with trifling or disgusting similitudes is constantly set at naught. How much mental injury may result from this straining after sensational representations of spiritual facts no one could easily estimate. The effect must be most unhappy both upon the teachers and the pupils, and it is clear that judicious criticism has a great work to do in correcting the extravagances of these hebdomadal commentaries. Is not the age we live in sufficiently earthly and sensual without permitting our Sunday-schools to be virtually used for the teaching of a new form of materialism?

OPEN LETTERS.

"What shall be Done with our Ex-Presidents?"

THE open letter, "What shall be Done with our Ex-Presidents?" which appeared in the August number of THE CENTURY, has called out many interesting and suggestive contributions on the subject,

VOL. XXXI.—31.

some criticising favorably and others unfavorably the plan there proposed. At the request of the editor, Mr. Francis Wharton, Solicitor of the Department of State, Judge Thomas M. Cooley, and Senator George F. Edmunds have given expression to the following opinions on the subject:

OPINION OF SENATOR EDMUNDS.

I HAVE yours of the 18th instant, asking my opinion on the subject of "What shall be Done with our Ex-Presidents?" The suggestions in the open letter you sent have been sometimes discussed at Washington, and I do not think they meet with favor. There are many considerations against disturbing the present autonomy of the Senate, which I have not time to go into. There is nothing that I know of in the nature of republican government which makes it necessary that an ex-President should have any other station or title than that of an eminent private citizen who has done his country important service in the most trying and difficult of all its public employments.

Whether suitable pecuniary provision for the maintenance of a retiring President might not well be made, is a question worthy of serious consideration.

George F. Edmunds.

BURLINGTON, VT., Aug. 28, 1885.

OPINION OF JUDGE COOLEY.

THE open letter in *THE CENTURY* for August to which you direct my attention, brings before the public a supposed wrong, done alike to our ex-Presidents and to the country, by allowing the head of the government to retire immediately to private life on the expiration of his term of office. The remedy proposed is to make him life senator with a large salary.

The wrong to the man is forcibly depicted. "But yesterday a king; to-day 'none so poor to do him reverence.'" Strangely inconsistent with this is the further remark, that he is "an object of perpetual and costly curiosity," condemned thereby, at great expense, "to sustain the dignity of the first citizen of the republic for the remainder of his life." Surely this does not indicate a want of regard, nor that he is cast aside "like the peel of an orange as worthless." Indeed, it is only the reverence of the people that makes him in the public mind, as the writer says, "disqualified for subordinate positions."

The peculiarity of the wrong to the man is, that it is incidental to conferring upon him for a time an office which crowns his ambition; an office which the ablest men long and labor for, and receive, when they attain it, with the liveliest satisfaction. The crowning glory and the incidental wrong are accepted together; the one merely qualifies the other, making it a little less complete and perfect. No one has ever yet declined the imperfect gift, and it may be safely predicted no one ever will. The question on this branch of the case, however, is rather one of pensions than of life senators, and I do not care to pursue it.

The wrong to the country consists in our being deprived of the services of the first citizen of the republic "at the very time when his availability as a public servant is presumably greatest, and when he deserves to be regarded as one of the nation's most valuable assets." This naturally suggests the query whether the nation has probably lost anything by not having the like senatorial services hitherto.

Washington in his retirement, disconnected from party politics, was an object of profound reverence and respect. The people idealized him somewhat, and it

is well that they did so, for their reverence for him tended to elevate the national character, and was thus a public benefaction. Had he entered Congress, something of this would have been lost; and possibly he might have come down to us more as a party leader than as the Father of his Country. This would have been a great national misfortune. Unwillingly, perhaps, but inevitably, he would have been head of the Federal party, and would be held responsible for its mistakes during the next four years, to the serious impairment of a reputation which now in its grandeur is to the country "one of its most valuable assets."

John Adams, descending from the Presidency to the Senate, could scarcely have been useful. He was for the time discredited with both parties, and without the influence justly belonging to his abilities and patriotism. He would have been the target for abuse, and subjected to the mortification of seeing himself subordinated in the public counsels to mere party hacks and tricksters. It was happier for him that he was not subjected to such a trial,—and as well for the country.

It would not have been well for Jefferson to enter the Senate. He was a partisan at his retirement as much as ever; he had thereafter his full share of influence on public affairs; and the regret is that he had so much to do with them, rather than that he participated so little. His domestic life, as we have it portrayed to us by his family, was beautiful, and we love to dwell upon it, and are the better for it; but we must ever regret that his uncharitable views of his political antagonists, which he kept putting on paper, were left where biographers and editors could pounce upon them.

I cannot follow down the list. There was good senatorial timber among the Presidents, but there was an obvious want of the senatorial quality in some cases, and I do not believe that so far the losses have been greater than the gains in the ex-Presidents retiring to private life. It is a great mistake to assume that a man would be less partisan after four years of party abuse in the Presidency than before; the experience of the country disproves the assumption. Think of Jackson, Van Buren, Polk, or Johnson—to name no others—as non-partisan senators!

But there is one case in which we ought to be thankful every day of our lives that an ex-President was not made senator on the plan proposed; for we should then have missed the most resplendent portion of his career, and the country the most important part of his life-service. That was the case of John Quincy Adams: the Old Man Eloquent; the triumphant champion of free speech in Congress. In the Senate he would have failed of his true destiny: his true place was in the House as the chosen representative of a great State; he needed the inspiration and the antagonism of numbers, and he needed also the backing of a constituency.

And right here is one of the weaknesses of the proposed plan: the senator would have no constituency. Chester A. Arthur, as senator for New York and with New York behind him, would be a man of power; but Chester A. Arthur, offered the senatorship from sympathy and to save his dignity, might well decline the doubtful honor. He would not in influence be a

peer among equals, and small minds would be likely often to remind him that he only lingered superfluous on the stage.

Important sentimental considerations are against the plan. It is a great and blessed thing for a country when it has among its citizens those who hold no office, but who stand before the public mind disconnected from the exciting questions of the day, as representatives of an honorable national history. If among them are men who have attained the first station, it might possibly be thought beneath their dignity to accept election to a lower; but how much more should it be so thought if the lower were offered as a mere favor, irrespective of the public choice, and might be held on to until perhaps the senility of old age should make the attempt to perform public duty a public mortification!

The answer, then, to the question, "What shall be Done with our Ex-Presidents?" is this: Allow them gracefully and with dignity—if they will—to enjoy the proud position of "first citizen of the republic." Their lives in retirement, if they be such as belong to an illustrious career, will be a continuous and priceless public benefaction. If they bore themselves worthily in office, party asperities will begin immediately to wear off; their virtues will be exalted in public estimation, and their homes will become the pilgrim shrines of patriotism. If they have been incompetent or otherwise unworthy, the shortest dismissal to oblivion is best for them and best for the country.

Thomas M. Cooley.

ANN ARBOR, August 31, 1885.

OPINION OF THE HONORABLE FRANCIS WHARTON.

It has been lately proposed in the columns of THE CENTURY that ex-Presidents of the United States should be *ex-officio* senators, and should have a pension for life of half the presidential salary. To the first branch of this proposition I think there are serious objections.

1. Our legislative structure is exclusively electoral; and the possession of a permanent seat in the Senate would be an anomaly to which public opinion could with difficulty be reconciled.

2. There would be no prospect of obtaining a constitutional amendment for such a purpose; and the adoption of such an amendment, even if it were possible, might be a dangerous precedent. It is not safe to amend a constitution, unless for reasons far stronger than those given for the proposed alteration.

3. Composed as the Senate is, such an addition would often so far determine its character as to give it a bias in opposition to what may be a salutary popular tendency. Supposing, for instance, that the interests of the country would be best subserved by the Administration of President Cleveland receiving the hearty support of the Senate, and supposing that the Senate, in Mr. Cleveland's third year, should be equally divided, it will be at once seen that the control of the body, if ex-Presidents were admitted to seats, would be in the hands of ex-Presidents Hayes and Arthur. Or let us take the period between 1849 and 1868, embracing the eras of slavery agitation, of civil war, and of reconstruction, and let us see how the proposed addition to the Senate would have affected the course of events by which the burden of slavery

was ultimately removed. From 1849 to 1852 the President-senators, according to your correspondent, would have been Messrs. Van Buren, Tyler, and Polk; from 1852 to 1856, Messrs. Van Buren, Tyler, and Fillmore; from 1856 to 1861, Messrs. Van Buren, Tyler, Fillmore, and Pierce; from 1861 to 1862, Messrs. Van Buren, Tyler, Fillmore, Pierce, and Buchanan; from 1862 to 1868, Messrs. Fillmore, Pierce, and Buchanan. Of all these ex-Presidents, Mr. Van Buren was the only one who had any sympathy with anti-slavery agitation; and even Mr. Van Buren declared that the fugitive-slave law should be retained on the statute-book, and that there should be no compulsory abolition of slavery in the District of Columbia. At the most critical period of the civil war, there would have been five ex-presidential votes which, on disputed issues, would have been blocks in the way of getting rid of slavery. As it was in the past, so it would be likely to be in the future. Men who have possessed power, especially those who have controlled the destinies of a nation, are generally unwilling to see pulled down the system they helped to build up; yet there is no country which has been in the advance line of civilization whose history has not been marked by a pulling down of old systems and a building up of new. To such an advance the amendment proposed would be a serious obstruction. Mr. Jefferson's policy of peace and of progress, beneficial as it was, could never, at least in the earlier years of his administration, have been carried out, if there had been in the Senate a platoon of Federalist ex-Presidents who would have made up a majority to veto his nominations and defeat his reforms; and the same fate might have befallen Mr. Lincoln's policy of limiting slavery and then abolishing it when incompatible with the maintenance of the Union, had the then living ex-Presidents been in the Senate taking an active part in politics.

It may be said that by giving ex-Presidents seats in the Senate without votes, the political equilibrium of the Senate would not be disturbed, while the ex-Presidents would be elevated to a post at once innocuous and dignified. I do not think that the conferring on ex-Presidents of such an office would be an elevation. When Napoleon went to Egypt, he took with him some French scientists. They were captured by an Arab chief, who asked them what their occupation was, thinking that at least they might accompany his cavalcade as mounted interpreters. They answered, so it was related, that their habits were sedentary. Now to the Arab there was then only one industry that was exclusively sedentary, and that was sitting on eggs, to which some of the fatter of the philosophic captives were condemned. Not much more practically useful would be the seats without votes which the project before us in this view would assign to ex-Presidents. The right to address the Senate would add nothing to their influence, since they could at any time address the Senate through the press. But depriving them of a vote, while giving them a seat, would impress on them, what no other human power could have impressed—the character of ciphers.

The objections just stated do not apply to the proposition to give to ex-Presidents a pension amounting to half the presidential salary. Such a measure would not be unconstitutional. We have had precedents of

granting thanks to ex-Presidents, and of allowances to Presidents' widows. If such provisions are constitutional, then unconstitutionality could not be predicated of pensions to ex-Presidents. But a stronger argument can be given for such a provision. The President is commander-in-chief of the army and navy, and as such is as much entitled to a retiring pension as is any officer in the service he commands.

There is reason, in fact, for such a provision far greater than exists in respect to the officers of the army and navy. An officer on service is not required to give expensive official entertainments; nor after his retirement is he likely to be overborne with visitors who exact from him hospitalities which he cannot without breach of courtesy avoid. It is notorious that few of our older Presidents were able to live within their official income, and that some of them were greatly embarrassed after their retirement by the expenses which their political distinction brought on them. General Washington and Mr. John Adams may be put out of consideration, since the former possessed a large fortune, and the latter's frugal if not unsocial habits relieved him from many expenses now considered inseparable from the office. Mr. Jefferson, whose hospitality though simple was genial and profuse, found that what properly remained to him after his expenditures as President was swept away by expenses in keeping up an establishment made in a large measure incumbent on him by the fame which, as President, he obtained. Mr. Madison, having no family, was able, by severe economy, to preserve a part of his modest patrimony to the end; but Mr. Monroe died insolvent, and General Jackson's estate was so impoverished by his Presidency as to make it necessary for him, childless as he was, to borrow largely, when returning to private life, to be able to re-stock his farm. It is true that since then the President's salary has been doubled; but his expenses have *pari passu* increased, and in the same proportion has increased the feeling of the unfitness of an ex-President engaging in business or in professional life.

Two concluding observations may be made:

1. Such a pension would take away the excuse for undue and disreputable economy at the White House.

2. Giving a suitable pension to an ex-President is more kind, more just, and more constitutional than withholding help from him when he is in poverty, and then, after he is dead and has suffered all the distress of believing that he is leaving his family without provision, buying his manuscripts or library and erecting to him a tomb.

Francis Wharton.

WASHINGTON, Sept. 2, 1885.

[From an interesting letter by Allen G. Bigelow we quote the argument given below.—EDITOR.]

EVERY United States senator represents a State. It could hardly be hoped that a President-senator should do otherwise. Hence, if Presidents became senators, now one State and now another would have one, perhaps two, even possibly three more senators in Congress than the constitution now permits, doing violence to our ideas of representation. Could it be expected that Mr. Arthur, were he now in the Senate, would be much more or less than a senator from New York? But New York is not entitled to another senator, and

no sister State would consent to such an arrangement. By the proposed plan New York and Ohio would now each have three senators; while in 1888, should Messrs. Cleveland, Arthur, and Hayes survive, New York would have twice as many senators as every other State in the Union except Ohio, which would still have three. In 1825 Virginia would have had five senators, Jefferson, Madison, and Monroe being her life-senators, in addition to the two regularly elected from that State.

Allen G. Bigelow.

The Poetic Outlook.*

FROM the coal-fields and the oil-regions the reports are reassuring. There seems to be no doubt that the supply is ample for the wants of the world yet these many years. Whatever comfort there may be in physical light and heat we may have without scrimping. But what of poetry? Is the supply of that running short?

Of verses there is no lack. Never before was there a time when so many people of both sexes had the knack of garnishing some sort of measure with some sort of rhymes. But is not the dearth of poetry somewhat alarming? Of our own leading poets (Bryant and Longfellow and Emerson and Whittier and Lowell and Holmes), three have gone over to the majority, and although the voices of the others are yet heard among us, and will be, we trust, for many days, the youngest of them is above three-score. In England the names that stand out with like distinctness are those of Tennyson and the Brownings; of these, one has been silent now for twenty-four years, and the others are gray-haired men, to whom the solemn chant, "*Morituri Salutamus*," is already familiar. Who are rising up to take the places of these poets of the people on both sides of the sea? It is a strange but not a singular fact that they have no successors by natural descent. What great English poet was the son or daughter of a great poet? Great engineers, great lawyers, great statesmen, transmit their power to their children; but poetry seems to defy the laws of heredity. In other paths of mental activity the children of poets are often eminent, but not in the path by which their parents climbed to glory.

The biologists say that traits often skip a generation, appearing in the third and fourth, though wanting in the second. The commandment of the decalogue which threatens calamities upon "the third and fourth generation," and says nothing about the second, is thus sometimes supposed to follow a physiological law. That notion is probably more curious than scientific. But even on this theory poetical genius does not appear to be hereditary. A glance over a chronological list of English poets shows that the great names do not reappear. Neither Chaucer, nor Spenser, nor Ben Jonson, nor Shakspere, nor Milton, nor Dryden, nor Pope, nor Wordsworth, nor Scott, nor Byron, nor Shelley left any near progeny who have been distinguished as poets. Mental power can be transmitted, but poetical genius seems to be an individual possession, not subject to physiological laws.

But not only is it true that the sons of the poets do

* It should be stated that this paper was written before the publication of Mr. Steadman's essay in the September CENTURY, on "The Twilight of the Poets."—EDITOR.

not take the places of their fathers; it is much to be feared that few successors are arising to them from any other source. In England who are the coming poets? William Morris and Swinburne and Robert Buchanan and Matthew Arnold—these are names somewhat noted, but which of them holds any such rank, or has won any such fame as Tennyson and the Brownings had won, and were holding, twenty-five years ago? In our own country it is not best to particularize; sweet and inspiring singers are among us; of the tuneful women, especially, there are not a few; but the fact remains that the places of our elder bards are not likely to be filled when they have passed away. The younger poets of this generation have gained no very strong hold on the multitude of their contemporaries. There is not one of them whose name is now known as Longfellow's or Bryant's name was known in a past generation; not one of them who is, in any large sense of the word, the poet of the people.

Is this because the present generation is less hospitable than the past generation to this high art? Something of this, no doubt. The arts of design and decoration, the arts that deal with things rather than with words, are occupying the thoughts of our contemporaries, to the exclusion of the finer art of rhythmic speech. Whether this change in the direction of the artistic motive is sufficient to account for the decadence of poetry may, however, be doubted.

It was sixty-four years ago that Mr. Bryant read his Phi Beta Kappa poem on "The Ages" at Harvard Commencement, and one of the seniors who listened to the poem was Ralph Waldo Emerson; it was fifty-four years ago that Mr. Whittier's "Legends of New England" was published; forty-six years ago that Longfellow's "Voices of the Night" appeared; forty-four years ago that Lowell's "A Year's Life" first saw the light. The times of which these poems were the product were different times from ours. They were times in which certain great questions of human welfare began to be hotly discussed. At the time when Bryant's first considerable poem appeared, a movement in church and in state was beginning to gain some headway, into which a large number of young men threw themselves with all the ardor of their nature. It is not necessary to describe all the phases of this revolution; it may be shortly characterized as the uprising of the sentiment of justice against certain long-cherished political and theological ideas. It was an ethical revolution; its strength was in its appeal to the hatred of wrong, to the love of equity and fair play. So far as the statement applies to the anti-slavery reform, it needs no argument; but it is equally true of the theological reforms simultaneously urged in various quarters. When Dr. William E. Channing wrote his critique on "Calvinism" in 1820, and when Dr. Nathaniel W. Taylor preached his *Concio ad Clerum* in 1828, the two men were far enough apart in their theology, no doubt; but the plea of both was a plea for justice against injustice; for equity against absolutism. They agreed in declaring that God had been represented to men as a tyrant, in protesting indignantly against this representation; and in insisting that the Judge of all the earth would do right. The root out of which the new theology grew was an ethical conviction; and this was true of it in all its varying phases. Whether this protest against the old theology

was justified by the facts or not is a question into which we do not enter; it is enough to say that the men who made it believed it to be just; that the impulse that led them on was a passionate love of righteousness. Certain philosophical notions became entangled in this debate, and it was round these, at length, that much of the battle raged; but it still remains true that the theological revolutions of fifty years ago had their source in a revolt of the moral sense of men against what was believed to be immoral in certain theological dogmas.

It was this battle against injustice, organized into the institutions of the state and framed, as some thought, into the creeds of the church, that was raging when these great poets of ours began to find their voices. It is not necessary to tell on which side of this battle they enlisted. From their earliest years all of them were witnesses for righteousness. They are all endowed with vision, music, sense of beauty; they know how, as Mr. Austin has lately said, to transfigure life; but the fire by which all their gifts were kindled was the love of righteousness. Vassals they gladly owned themselves, not first of beauty, but of all highest Truth; and they hastened, in words of one of them, to

"Lay on her altar all the gushings tender,
The hope, the fire, the loving faith of youth."

The poet, as the same voice in the same ode bears record, is one

"Who feels that God and heaven's great deeps are nearer
Him to whose heart his fellow-man is nigh;
Who doth not hold his own soul's freedom dearer
Than that of all his brethren, low or high;

Who to the Right can feel himself the truer
For being gently patient with the wrong;
Who sees a brother in the evil-doer,
And finds in Love the heart's-blood of his song."

Such was the inspiration of our greatest poets; such the passion that mastered them; it is not possible to conceive of any of them as existing without this enthusiasm of humanity, this genius of righteousness.

Their brethren on the other side have been of the same mind. In the last great singers of the English tongue the ethical temper and the Christian spirit have found full and masterful utterance.

Unhappily no such strenuous strife for moral values enlists the energies of our contemporaries. The particular causes to which we have referred no longer call for championship; slavery is dead and the protest against absolutism in theology has done its work,—overdone it, no doubt; for while no one now believes that God is a tyrant, there be many who seem to doubt whether he has any authority at all. The "advanced thought" of fifty years ago found expression in the doctrines of the Fatherhood of God and the brotherhood of men; what is regarded as the advanced thought of to-day finds expression in the dismal negations of a materialistic pessimism. The poetry that exhales from this abyss is of a clammy and spectral sort; the breath of life is not in it.

It is plain that the conditions are not favorable at present for the production of great poetry. A stronger faith in spiritual realities and a broader and more genuine humanity are needed for the nourishing of high poetic inspirations. There are some signs of a resurrection of faith, and there are great questions of human rights yet to be settled, not, there is reason to fear, with-

out the confused noise of the warrior and garments rolled in blood. The Christian law has been roughly applied to the distribution of political power; it is yet to be much more fully applied to the distribution of property. Before that thought and that fact are wedded, there is likely to be "a bridal dawn of thunder-peals," and the bard will not be wanting to sing the nuptial song.

Washington Gladden.

Wanted—a Universal Tinker.

IN some of our cities the introduction of the French eight-day clock created a new occupation—that of general clock-winder. Householders found that their clocks required a good deal of setting, and regulating, and encouraging, and scolding, and winding; so a score of them would club together and hire a man to call around once a week and do all of these things. This made the French clock enduring, and life went smoothly on again.

Good modern houses are now so elaborate, that what we sorely need is an expansion of the clock-winder idea; that is to say, there is room for a new occupation—that of Universal Tinker. Nearly every day in the year, in a large dwelling-house, you will find a mechanic of some sort at work. To-day a slater is renewing a slate on the roof; to-morrow a plumber will be renewing a washer in a bath-tub; yesterday a joiner was adding a shelf in the china closet. These men must be paid one or two dollars apiece for service worth from ten to fifty cents. The Universal Tinker—under a regular salary of three dollars a month, paid to him by each of forty or fifty householders along a street or in a neighborhood—would have done the three jobs in an hour, and the expense to you would be nothing but his trifle of wages and the trifle of material he would use.

At first the Universal Tinker would be pretty busy—until he got your house in ship-shape everywhere; after that he would become largely a *preventer* of mischief, by watching for it and checking it before it got a fair start; and so, as a rule, ten minutes a day would be all the time he would need to spend there. And what rest and peace he would give you after all these years of fretting and harassment!

The coming benefactor—the Universal Tinker—will do such things as these for you, to-wit:

Put in window-panes.

Mend gas-leaks.

Keep the waste-pipe and other water-pipe joints tight.

Make periodical search for sewer-gas and head it off, instead of waiting for an unaccountable death in the family to suggest possible sewer-gas and an examination.

Watch the zinc and things in the electric bell batteries, and renew them; add water before the water gets out; reënforce the strength of the sal ammoniac while it yet has some strength to reënforce.

Find out why a certain door or a certain window won't go on the burglar alarm, and apply the remedy.

Find out why the alarm clock persists in taking the alarm off the house in the night and in putting it on in the daytime, and cure the defect.

Keep all the clocks in the house in repair, properly set, and going.

Mend roof-leaks, with slates, tin, or shingles.

Glue the children's broken toys, especially those costly French dolls whose heads are always coming off, and whose parts have to be sent all the way to New York to be fixed together again.

Paint newly inserted joints of tin eaves-pipes the color of the rest of the pipe. The tinner never does that, but leaves a three-minute two-dollar job for the painter.

Glue and otherwise repair the havoc done upon furniture and carved wood by the furnace heat.

Keep the cats out of the cold-air boxes, and put wire netting over the box-ends.

Pack water-pipes in sawdust, where the thoughtful plumber has left them a chance to freeze.

Silence the skreaking door-hinges with soap or oil.

Jack-plane the edges of doors that won't shut.

Reset door-lock sockets which have become too high up or too low down by the settling of the house-walls.

Supply lost door-keys.

Fix the window-catches so they will catch.

Correct obstinate sashes that refuse to slide up and down.

Readjust window-ropes that have gotten out of the pulleys and won't work.

Put up a shelf here and there where it is wanted.

Repair the crumbling chimney-tops from year to year.

Dig up and repair the earthenware drains now and then.

From time to time unchoke the pipes that drain the roof.

Level the billiard table and tighten the screws.

Put a dab of paint or putty or something here and there where needed.

Any bright, handy fellow can learn to do all of these things in a little while. The writer knows a householder who does them all, and is entirely self-taught. The Universal Tinker could earn eighteen hundred dollars a year, be idle an hour or two a day, and save you five hundred dollars a year at an expense not worth mentioning.

AMERICAN ARISTOCRACY.

Footman (announcing): "Mister Stuyvesant Van Rennselaer Schermerhorn-Binks."

IN THE LIBRARY.*

The Sultan of My Books.

"There is many a true word spoken in doggerel."—*Czech Folk-song.*

COME hither, my Wither,
My Suckling, my Dryden!
My Hudibras, hither!
My Heinsius from Leyden!
Dear play-books in quarto,
Fat tomes in brown leather,
Stray never too far to
Come back here together!

Books writ on occult and
Heretical letters,
I, I am the Sultan
Of you and your betters.
I need you all round me;
When wits have grown muddy,
My best hours have found me
With you in my study.

I've varied departments
To give my books shelter;
Shelves, open apartments
For tomes helter-skelter;

There are artisans' flats, fit
For common editions,—
I find them, as that's fit,
Good wholesome positions.

But books that I cherish
Live under glass cases;
In the waste lest they perish
I build them oases;
Where gas cannot find them,
Where worms cannot grapple,
Those panes hold behind them
My eye and its apple.

And here you see flirting
Fine folks of distinction:
Unique books just skirting
The verge of extinction;
Old texts with one error
And long notes upon it;
The "Magistrates' Mirror"
(With Nottingham's sonnet);

Tooled Russias to gaze on,
Moroccos to fondle,

* These original poems are taken by permission from "Ballads of Books," a volume to be edited by Mr. Brander Matthews.

My Denham, in blazon,
My vellum-backed Vondel,
My Marvell,—a copy
Was never seen taller,—
My Jones's "Love's Poppy,"
My dear little Waller;

My Sandys, a real jewel!
My exquisite "Adamo!"
My Dean Donne's "Death's Duel!"
My Behn (naughty madam O!);
Ephelia's! Orinda's!
Ma'am Pix and Ma'am Barker! —
The rhymsters you find, as
The morals grow darker!

I never upbraid these
Old periwigged sinners,
Their songs and light ladies,
Their dances and dinners;
My book-shelf's a haven
From storms puritanic,—
We sure may be gay when
Of death we've no panic!

My parlor is little,
And poor are its treasures;
All pleasures are brittle,
And so are my pleasures;
But, though I shall never
Be Beckford or Locker,
While fate does not sever
The door from the knocker,

No book shall tap vainly
At latch or at lattice
(If costumed urbanely,
And worth our care, that is);
My poets from slumber
Shall rise in morocco,
To shield the new comer
From storm or sirocco.

I might prate thus for pages,
The theme is so pleasant;
But the gloom of the ages
Lies on me at present;
All business and fear to
The cold world I banish.
Hush! like the Ameer, to
My harem I vanish!

Edmund Gosse.

De Libris.

TRUE — there are books and books. There's Gray,
For instance, and there's Bacon;
There's Longfellow, and Monstrelet,
And also Colton's "Lacon,"
With "Laws of Whist" and those of Libel,
And Euclid, and the Mormon Bible.

And some are dear as friends, and some
We keep because we need them;
And some we ward from worm and thumb,
And love too well to read them.
My own are poor, and mostly new,
But I've an Elzevir or two.

That as a gift is prized, the next
For trouble in the finding;
This Aldine for its early text,
That Plantin for the binding;
This sorry Herrick hides a flower,
The record of one perfect hour.

But whether it be worth or looks
We gently love or strongly,
Such virtue doth reside in books
We scarce can love them wrongly;
To sages an eternal school,
A hobby (harmless) to the fool.

Nor altogether fool is he
Who orders, free from doubt,
Those books which "no good library
Should ever be without,"
And blandly locks the well-glazed door
On tomes that issue never more.

Less may we scorn his cases grand,
Where safely, surely linger
Fair virgin fields of type, unscanned
And innocent of finger.
There rest, preserved from dust accurst,
The first editions — and the worst.

And least of all should we that write
With easy jest deride them,
Who hope to leave when "lost to sight"
The best of us inside them,
Dear shrines! where many a scribbler's name
Has lasted — longer than his fame.

Cosmo Monkhouse.

On the Fly-leaf of a Book of Old Plays.

AT Cato's-Head in Russell street
These leaves she sat a-stitching;
I fancy she was trim and neat,
Blue-eyed and quite bewitching.

Before her, in the street below,
All powder, ruffs, and laces,
There strutted idle London beaux
To ogle pretty faces;

While, filling many a Sedan chair
With hoop and monstrous feather,
In patch and powder London's fair
Went trooping past together.

Swift, Addison, and Pope, mayhap
They sauntered slowly past her,
Or printer's boy, with gown and cap
For Steele, went trotting faster.

For beau nor wit had she a look,
Nor lord nor lady minding;
She bent her head above this book,
Attentive to her binding.

And one stray thread of golden hair,
Caught on her nimble fingers,
Was stitched within this volume, where
Until to-day it lingers.

Past and forgotten, beaux and fair;
Wigs, powder, all out-dated;
A queer antique, the Sedan chair;
Pope, stiff and antiquated.

Yet as I turn these odd old plays,
This single stray lock finding,
I'm back in those forgotten days
And watch her at her binding.

JANUARY, 1886.

No. 3.

THE CITY OF TEHERÂN.

SECOND PAPER.

IN such a climate as that of Teherân life is naturally passed chiefly in the open air. The chill of winter, rarely severe, seems to make little difference in the habits of the people. The shops are all open to the streets; the customers stand outside, and even the shop-keeper attends to most of his business from the exterior of the shop. If he is a baker, grocer, or costermonger, in all probability he and the customer both stand in the street, retreating into the shop only when a string of camels or a dashing cortège forces them to move out of the way. A carpenter may frequently be seen arranging a piece of joinery on the pavement in front of his shop. The schools often in no wise differ from the shops; in the midst of a crowded thoroughfare one may see twenty or thirty lads seated on their heels repeating the lesson together in monotonous tone.

Another common sight in the streets of Teherân is the itinerant barber. The Koran enjoins the masculine Mohammedan to shave his crown. The Sunnees shave the entire head excepting a long lock in the center whereby, it is said, the archangel may pluck them out of the grave. But the Sheahs or Persian Mussulmans shave from the forehead to the nape of the neck, leaving a highly prized lock on each side. It is therefore common to see a man of the lower classes seated on the pavement, going through the operation of having his head shaved. The remaining hair and the beard are dyed, and it is rare that one sees gray hairs in Teherân. The first tint applied is henna, an orange-yellow vegetable dye. Many consider this so handsome as to prefer it without the further application of indigo which most select. The last tint, combined with the henna, im-

parts a durable and rather agreeable dark-brown color to the hair. The women also have their hair dyed and join the eyebrows with the pencil. All classes make use of the bath at least once a week, the wealthy having steam-baths attached to their dwellings. No Christian is ever permitted admittance to the baths of the Persians. The public baths answer the purpose of clubs and sewing circles; the women go in the morning, take their sewing with them, and, after being thoroughly steamed and scrubbed, devote several hours to smoking the *kaliân*, embroidering, and discussing the scandal of the neighborhood, which they assiduously circulate on their return home.

Another street sight of Teherân is the tea-house, equivalent to the coffee-house of Constantinople or the beer-garden of Munich. These establishments are generally thronged towards the close of the day. It is a curious fact that although Persia adjoins the coffee plantations of Araby the Blest, tea flavored with lime juice or lemon is more the beverage of Teherân than coffee. This is owing partly to contact with the Tartars on the north-eastern frontier, and in all likelihood, also, to the fact that from the tenth to the thirteenth century there was considerable commerce between Persia and China, at which period a colony of Chinese was imported into Persia, who produced the famous Perso-Chinese ware called Kashee, good examples of which are now rare and costly. Both wine-drinking and card-playing are forbidden to true believers, and therefore neither is seen in these places of public resort. But both are freely indulged in at home. The card-players of Persia use a set of twenty cards in five suits of four each. These suits are called the

Hunter, the Child, the Courtesan or Woman, the Prince, and the Soldier. They are made by hand, and preserved by a thick, glossy coat of varnish. While following the idea suggested by the name of the card, each artist varies the design according to his fancy, sometimes giving them high finish and rich chromatic effects, the colors being applied on a gold ground or decorated with gold tincture. Some of the sets used by the wealthy are valued at fifty dollars. The famous artist of Shirâz, Agâ Nedjêf, who lived early in this century, did not disdain to display his talents on playing-cards. It is an interesting fact that America must relinquish the claim of having invented the gambler's favorite game of poker, for it was known in Persia centuries ago. The game played by the Persians is in principle poker or brag pure and simple, and betting often runs high with them.

Another characteristic sight in the streets of Teherân is the bread. Persian bread is made in sheets the thickness of sole leather; the best quality is somewhat thinner. It is formed in the shape and size of a side of leather. The baker with bare arms dexterously raises a sheet of this dough from the

counter where it is rolled out, tosses and rolls it over his left arm until reduced to the proper tenuity. With a rapid fling of both arms he then spreads it over the hot floor of the oven. In a few moments it is baked and spread out to cool. If there is a convenient ledge in the street near the shop, one may see it covered with layers of bread. This bread is cheap, one cent a sheet, and what is more it is sweet and nourishing, and, with curds, cheese, and fruits, forms a staple article of diet with a large part of the population. Consequently, one constantly meets with people carrying sheets of bread home with them, the women holding them in front like leather aprons.

Speaking of fruit reminds me that the market of Teherân is in this respect one of the best in the world. Many varieties of grapes of excellent flavor abound for five months at less than a cent a pound. The melons of Persia are famous, especially the muskmelons. They cost a mere trifle, and the crop lasts for four months. A quality I have never seen elsewhere is the sugar-melon; in external shape and color it is like other muskmelons, but the inside presents a uniform gray-white color, and in texture and

CONFECTIONER IN THE BAZAAR.

A PERSIAN BARBER.

flavor it suggests the jelly cocoanut. The quinces are unsurpassed in size and flavor, and the same may be said of the pomegranate, which continues all winter and takes the place of our winter apples. The layers of ruby fruit shading off to a coral hue are exquisitely beautiful. The apricots and peaches are also good and abundant. The oranges of Ghilân are large and handsome, but inferior in flavor

to those of Sicily. Figs, apples, and pears are also common, but not equal in quality to the other fruits of Teherân. The abundance of grapes in Persia affords a capital opportunity for making excellent pure wine. Several varieties are made by the Armenians, but they are not properly prepared, and do injustice to the vineyards from which they come. Although forbidden by the laws, wine-making is

winked at; and there is little doubt that a European expert in wine-making who should come to Persia would find means to obtain permission to develop the wine product of the country to a degree beneficial at a time when the vineyards of France are yielding less than their average supply.

Although the bazaars and shops of Teherân are well stocked with the goods of native and foreign markets, yet the upper classes and the European population make most of their purchases through a numerous and intelligent class of itinerant venders who carry their wares from house to house on little donkeys. Keats, in his "Eve of St. Agnes," gives a delicious descriptive catalogue of Oriental fruits and sweets; what poetic figures, what glowing strophes would he employ if he were to behold the wares unfolded by these peddlers to the wondering sight of the purchaser! The imagination is kindled, the yearning to possess is stimulated to an unusual degree when the lover of the beautiful beholds the floor of his apartment spread with the various exquisite articles which the turbaned *dellâl* unfolds to his gaze. Not a day passes but one or more of these men appear. Bowing low, they beg permission to display their wares, holding up at the same time some choice antique rug, embroidery, or porcelain, such as you are known to prize. It is useless to resist; whether intending to buy or no, you order the saddle-bags to be brought in and their contents revealed. Then shall you behold rugs, ancient and modern, of Kurdistan, Turkistân, or Kermân; shawls of price from Cashmere; dazzling embroideries from Resht and Shirâz; kaliâns of silver and gold inlaid, with superb boxes carved and painted with scenes of Persian life or inlaid with delicate ivory patterns; veils exquisitely embroidered; velvets massive with silver and gold thread; blades from Khorassân; wavy daggers and coats of mail inlaid with silver and gold; bowls and plaques of Kâshee ware; refect tiles seven hundred to one thousand years old; antique coins and gems, engraved with verses from Hafiz or the Koran; rare old manuscripts of the poets, illuminated and illustrated with quaint and characteristic designs; peacocks, elephants, salvers, vases, and bowls beautifully and elaborately engraved or wrought in open designs of brass; diamonds, rubies, pearls, and turquoises for which Persia is famous; coffee sets in silver filigree and bracelets wrought in yellow gold; tigers' skins from Mazanderân; furs from Astrakhân; old flintlocks with inlaid stocks, and even swords captured from the English in the Afghân wars; chess-men curiously carved; silk sashes fit for the person of royalty; gayly wrought

saddle-cloths; and superb bits of mosaic from the mosques and palaces of Ispahân.

Such is a brief *résumé* of the character of the wares almost daily exhibited at my house. One soon learns that if he does not buy an article when offered him, thinking he can get one like it at another time, the opportunity of doing so rarely returns. It is the great attraction of Oriental art that it is individual. Until a European firm in Persia unfortunately employed some of the carpet-makers to reproduce certain ancient designs, it was impossible to find two rugs or carpets in Persia identical in design. The same holds true about all Persian decorative art. Each artisan there stamps his own individual taste and fancy on the products of his labor. This is indeed art; how different from that everlasting repetition of the same design which is the bane and the blessing of European and American decorative art, especially in textile fabrics and furniture. It is a blessing for the poor, who can obtain pretty things for a price within their means, but a bane for the well-to-do who wish original objects, but cannot afford to pay the price demanded by European and American artists who produce only unique results for sale.

Therefore, if a Persian peddler offers a certain object that you desire, it must be bought then and there, or it will be snatched up by some one else. This is especially the case with antique curios. These *dellâls* generally sell on commission. It is not uncommon for a lady of rank, who wishes to realize on her treasures, to place a costly Cashmere shawl or embroidery in the hands of a *dellâl*, of a quality which, perhaps, one might seek for in vain through the bazaars. By shrewd management and much chaffering such an article may sometimes be bought at a great bargain.

The old armor is also difficult to find now, while the demand for this and also for old coins is such that the artisans of Hamadân and Ispahân, taking advantage of their genius for imitation and the low price of labor, make many fine reproductions of the antique, which are shipped to Europe or sold to European residents or travelers. The old armor of Persia is justly renowned for the picturesque beauty of the designs lavished upon it, and the admirable temper of the metal. Both are cleverly imitated now to the eye, and he who cannot secure the genuine antique may well purchase the imitations to decorate his dining-room or studio. The process of bargaining with these *dellâls* is very amusing. Their favorite phrases are "*Mâlî kadeem est*" (It belongs to the old time), and "*B'cheshm*" (On my eyes be it; *i. e.*, I swear by my eyes), a phrase constantly met in the "Arabian Nights."

VILLAGE ON THE ROAD FROM RESHT TO TEHERÂN.

Another form of expression, when they wish to assure one of the truth of their statements, is to swear by their own beards, or to pluck hold of the beard of the purchaser and swear by that. They are courteous and patient to a degree, never showing any spite if, after an hour's chaffering and unpacking and repacking their goods, they have only sold a few cents' worth. In case an article is of value, it is common to leave it for a day or two to give the purchaser ample time to consider its attractions. It is a pleasant thing to deal with Persians, even if their slow ways sometimes try the patience of the more expeditious Westerner, for they are good-natured and respectful. It is another peculiarity of these *dellâls* that if one does not make a purchase they rarely return. It is well, therefore, to buy some trifle of them in order to have another chance at their wares at a more convenient hour. If an important sale is made, it is soon known among the whole fraternity, and for several days other *dellâls* will frequent the house with similar goods. There is also a somewhat annoying custom, not easily avoided, which allows the servants to levy a commission from the *dellâl*. If he does not agree to the terms, then the porter excludes him, and thus one may miss

some rare article, which is then grabbed by a fortunate neighbor.

The art in brass to which I alluded above is one of the most interesting now pursued in Persia. Fine examples are fortunately within the reach of every one, for the material is inexpensive and the cost of labor trifling. It would be impossible to surpass the beauty of form exhibited in some of these ewers, vases, censers, candlesticks, and salvers or lamp standards. They are generally of light, open tracery, the solid spaces being finished with engraved designs representing bits from the poets and intricate hunting, court, battle, or dramatic scenes, or public dancers and acrobats, interwoven with arabesques of extreme intricacy and beauty. Many of these articles in brass are purely ornamental, such as a pair of mantel ornaments in the possession of the writer whose form was suggested by the gracefulness of the Oriental cypress. A candlestick in my possession was also undoubt-

WATER-CARRIER, TEHERÂN.

edly suggested by the palm-trees along the shores of the Persian Gulf.

As regards the rugs now for sale in Persia, it may be well to add that after the discovery of aniline dyes the embroideries and textile fabrics of Persia were injured by a large introduction of aniline colors. This affected both the beauty and durability of the design. One way to test them is to pass a wet cloth over the suspicious tints. No article that leaves a stain on the cloth can be recommended. But the importation of aniline dyes into Persia has been at last forbidden by the Government, who are well aware of the injury eventually to follow from them if used in the manufacture of one of the most important articles of the Persian export trade. There are many

varieties of Persian carpets and rugs; the most important bear the name of the province where they are made. The most valued are those having more or less silk; these are used chiefly for portières. Another highly prized sort are the rugs of Turkistân, which are distinguished by a fine velvety surface and a pattern of extraordinary richness. While the same general design enters into most of the Turkistân rugs, no two are exactly alike. The old Turkistân rugs are of great value; some which are undoubtedly fifty to eighty years old are still brilliant, while the colors are toned by time and the texture is admirable. As the Turkomans have opportunities of procuring aniline dyes from Russia, they sometimes use them in the rugs they now

produce, which must therefore be examined with great care, however attractive their appearance. The colors of old Persian carpets can invariably be relied upon.

mentioned here.) The one occupied by His Majesty Nusr-ed-Deen Shah is called the Ark. With the building reserved for the ladies of the royal household, it occupies the south-

ROYAL SUMMER RESORT, KASR-KHAJÂR, NEAR TEHERÂN.

Another Persian fabric that has great beauty, but is now becoming scarce, is the intricate embroidery of silk formerly worn by the women. A change of costume or fashion has superseded these embroidered pantaloons. They present a solid mass of needle-work, and are admirably suited to cover ottomans or chairs in a drawing-room. The embroideries of Resht commend themselves for their wealth of decoration, but should be carefully examined as being liable to have aniline dyes. The designs of the best have many parts of the ground cut out and the colors represented by pieces delicately sewed into the apertures. The embroideries of Shirâz resemble those of Resht in appearance, but are executed by a reverse process, the colors being represented by pieces, often of velvet, applied to the ground cloth.

Among the most interesting objects in Teherân are the palaces and neighboring resorts of the King. (See the December CENTURY for illustrations of some of the buildings

eastern portion of a large district of the city devoted to the arsenal, the Government offices, the stately residence of the Prince Naib Sultanêh, Minister of War, and the magnificent square of the barracks previously described where the garrison is chiefly quartered. The palace is surrounded by numerous courts and gardens handsomely laid out and abounding in shade-trees. The exterior of the palace is picturesque rather than imposing, having reached its present form by additions made from time to time. Much of it is pleasingly decorated with rich Oriental designs in tiles and glazed bricks. The interior apartments are planned on a spacious scale, elegantly combining European with Oriental luxury, and presenting a magnificence commensurate with a great and celebrated empire.

To many the most interesting spectacle in the Ark is the Museum or Treasury of Crown Jewels. The royal permission is necessary to an admittance to this inestimable storehouse of riches. A number of the royal houses of

SUMMER-HOUSE OF THE SHAH AT ENZELL.

Europe and Asia possess collections of crown jewels, such as that of Dresden or Constantinople; but it is safe to say that there is none which surpasses the splendor and importance of the one belonging to the crown of Persia. Let one consider the many ages of Persia's national existence, the pageantries for which her court has always been renowned, the vast extent of territory she once held, from the Oxus and the Crimea to the Indian Ocean, and from the Mediterranean to the Ganges; let him consider that it is less than two centuries since Nadir Shah returned from the sack of Delhi, his army loaded with treasure, while the conqueror reserved for his share gems and riches valued at upwards of one hundred millions of money. In this treasure-house at the Ark one sees, therefore, diamonds of the largest and rarest quality, including the famous Dar-i-Noor, or Sea of Light, and rubies and emeralds and other gems of like degree; several crowns and suits of armor of enormous price; the choicest examples of all that Ori-

ental art has produced in metals, enamels, shawls, embroidery, swords of matchless temper whose hilts and scabbards are a solid mass of diamonds, together with presents innumerable received from the crowned heads of Europe and Asia for ages past. Prominent amid this dazzling profusion of splendor is the renowned Peacock throne, which is variously estimated to be worth from \$13,000,000 to \$25,000,000. Of less pecuniary value, but highly interesting as showing the wide range of subjects which occupy the attention of the Shah, is a finely arranged collection of specimens of all the minerals of Persia. One leaves the Treasury with his imagination dazed; it is indeed as if he had been studying the concentrated essence of the "Arabian Nights," and at last realized the "gorgeous East, or wealth of Ormus or of Ind."

A feature the visitor will notice at the Ark is the crimson curtains and awnings which protect the windows and doors from the heat of the noon-time. This hue for curtains, awn-

ings, and umbrellas is reserved for the royal family; the use of it for such purposes by any others in Persia is strictly forbidden.

Nusr-ed-Deen Shah, the present occupant of this stately palace, is one of the best known of modern Oriental sovereigns because of the two visits he has made to Europe. The fact of his undertaking these distant and costly excursions is in itself a decided indication of the progressive character of this distin-

too overtly resisted, as the system of government and laws is theocratic; and partly because any important radical measures the Shah may propose for the improvement of his dominions are hindered by the intrigues of powerful neighbors, whom it is not expedient to arouse to open opposition. If the powers would only let Persia alone, she has a vitality that would carry her to another epoch of national greatness. But under present

THE WOMEN'S APARTMENTS OF A ROYAL PALACE, TEHERÂN. (REPRODUCED FROM A DRAWING IN A PERSIAN PAPER.)

guished monarch. It is the fashion for the diplomats of certain courts to decry Persia, her court, and her King. This is done either through ignorance or with the secret but distinct intention of lowering the influence and power of Persia for the purpose of preventing that progress which would better enable her to resist the encroachments of ambitious and unscrupulous neighbors. There is no living sovereign more talented or more swayed by generous and progressive views than Nusr-ed-Deen Shah. He has been on the throne forty-five years, and is very popular in Persia. Humane in disposition, widely informed and patriotic, if his projects for the elevation of his dominions do not always succeed, it is partly because time is required to transform the habits and prejudices of an old, long-established people; partly because of the corrupt character of his *entourage*, who may not be more corrupt than Persian courtiers have been for ages, but who yet are corrupt; partly because of the natural opposition of the Mohammedan clergy, who must not be

circumstances her progress is constantly hindered and even her existence is menaced.

Nusr-ed-Deen Shah has three sons. The eldest, and probably the ablest and most ambitious, is the Zelee Sultân, governor of the central provinces, whose capital is Ispahân. But he cannot inherit the throne because his mother was of plebeian birth. He is a man of great force of character, who has been in office, as he told me, since his tenth year. The heir-apparent is the second son, who has the title of Valy-ahed, and is governor *ex officio* of the important frontier province of Azerbâijân. It is my impression that he is playing a part, purposely concealing his aims and abilities. The third son, entitled the Naïb Sultânéh, is Minister of War, and a man of very affable disposition.

Another interesting and important palace of Teherân is Negaristân. It was built by Agâ Mohammed Shah, and added to by the great-grandfather of the present King, Feth Aleé Shah. At that time it stood nearly a mile beyond the city; but now Teherân has grown

VALY-AHED, OR HEIR-APPARENT.

some distance beyond it. The entrance faces a large square, whither, on the feast of Courbân Bâirâm, a camel is led forth decked with ribbons and drapery and slaughtered for a sacrifice. Over the gate is a graceful *balahanêh*, or lodge, supported by a row of elegant pillars. The carriage enters a spacious garden, beautified with a triple avenue of venerable plane-trees girt with ivy. No other building than a modest porter's lodge is visible. But on entering a winding passage in this structure we are surprised to find that it leads to an extensive continuation of the park, which is here laid out with graveled walks by whose side are stone

channels filled with running streams. About the whole scene is such an air of rural quietude, broken only by the twitter of sparrows or the rapturous melody of nightingales, that one can hardly imagine that he is still within the limits of a large city. The paths lead to a marble tank and a small but exquisitely beautiful pavilion beside it, whose exterior is decorated with the most beautiful stucco-work I have seen in Persia. The interior consists of a single cruciform apartment covered with a domical roof. The whole of this arched ceiling is a mass of delicate designs in stucco, colored with green, scarlet, and gold; the same scheme of coloring is followed on the graceful spiral pillars which support the dome in the center. Three arms or alcoves of the pavilion are furnished with luxurious divans on either side, reaching to the windows, which are closed by sashes capable of being raised and opening the entire side to the air and the prospect. The sashes are designed with the intricacy of a Gothic rose window, and are filled with stained glass. The floors are spread with expensive rugs. The plan is symmetrical, while the details are so rich and harmonious as to be highly poetical and artistic. The central truth which impresses one when comparing this little gem with attempts now made at elaborate decoration in England and the United States is its evident spontaneity. The man who designed it was at once a poet and an artist; it is useless to deny that the two are not always combined, and that only when the poetic fancy and fervor are added to the artistic instinct can the best results be achieved in art. In modern decorative art one perceives, notwithstanding its occasional successes, that it is wholly intellectual. The artist has studied the art of other ages, and out of this acquired knowledge deliberately seeks to evolve something original. The consequence is just what might be expected; there is an absence of spontaneity, the effect is scattered, the combinations are strained, and one is ever reminded of something he has seen elsewhere in a much more correct style. Now in Oriental art the artist or architect is not disturbed by what he has learned by study, nor is he striving after effect, but his imagination teems with original thoughts, and he cannot rest until he has given expression in his own way to his love of the beautiful. We, too, in time may have such decorative artists, but there is no question that they do not yet exist in the United States. To bestow too much praise on the present phase of American household and decorative art is to retard the coming of the genuine school that is to supersede it.

From this pavilion we reënter the park, and

continue our walk until it brings us to another broad tank and the apartments formerly occupied by the King. An interesting feature of this building is a small reception-room whose two largest sides are capable of being opened and protected from the sun by large awnings. At each end of the room is a life-size painting representing the sons of Feth Aleé Shah. From this apartment we pass into an octagonal court around which the chief

decorations, are of a coarse style of art, evidently borrowed from cheap European prints. But one soon forgets to notice them in the magnificent historical frescoes which on every side fill the upper half of the walls. We see before us in well-arranged groups full-length, life-size portraits of Feth Aleé Shah on his golden throne, with his thirty sons gathered around him, and on either hand the English, French, and Russian ambassadors,

AUDIENCE CHAMBER OF THE ROYAL PALACE, TEHERÂN.

building has been erected. The area of this court for a space of nearly eighty feet is occupied by an immense tank. Thence another walk through the park takes one to the anderoon, formerly occupied by some of the numerous wives of Feth Aleé Shah. The parlor of the King in the lower story of this building offers another highly interesting example of Persian art. The vestibule is low, but richly tinted and gilded, and is separated from the parlor by light pillars of wood, whose form and capitals suggest the grand columns of Persepolis. The ceiling of the apartment is high, considering the small size of the room. Every portion is enriched with green, scarlet, and gold, alternated with panels representing hunting-scenes painted directly on the plaster. These pictures, although blending agreeably with the other

and the chief courtiers and officers of the realm. The portraits are evidently characteristic likenesses, while the various court costumes of eighty years ago, silks, embroidered sashes, tunics of Cashmere shawls, and glittering decorations and armor are represented with a fidelity that gives great historic value to the painting. Feth Aleé Shah was a patron of the arts, and also one of the chief poets of modern Persia; his poems partake of the style of Hafiz. He was a man of striking appearance, giving much attention to the care of his person, and especially of the magnificent beard for which he was celebrated.

It was in this palace that the great Kai-makâm or prime minister of Mohammed Shah met his untimely fate. This monarch, third in the succession of the Khajar dynasty, was not more cruel than most Oriental des-

pots, but was naturally made suspicious and jealous by his position. The Kaimakâm was not only a famous poet, he was also a statesman who had the address to acquire a very prominent part in the administration of affairs. This finally aroused the jealousy or apprehension of Mohammed Shah, although there seems to have been little reason for the tyrant's fears. One pleasant afternoon, when the vizier was sitting in the park of Negaristân, quietly sipping a cup of tea, the executioner brought him the order of the King that he had but five minutes to live. The vizier received the summons with calmness, and composed two lines on the spot, which have become proverbial in Persia: "Such is life; now it overwhelms us with honors, and anon it clothes us with thorns. Fortune, like a juggler, delights to play us a thousand tricks like this." Five minutes later he was suffocated, it is said, by a mattress laid over him in an apartment of the palace, although one living at the time told me he died by the cord.

Before leaving the anderoon we were taken to the bath, where the royal ladies were wont to disport themselves. Proceeding down an inclined plane, we entered a subterranean hall of marble supported by pillars clustered around a circular pool. Opposite to where we entered was a steep slide of polished marble. This was built to enable Feth Allee Shah to indulge in an original sport which reminds one of the delights of the gardens of Armida. From the upper story of the anderoon his wives proceeded, somewhat thinly clad, to the top of the slide, and with much merriment deftly slipped into the arms of the royal husband, who waited for them below. The bath is connected with this subterranean hall, and consists of several apartments faced with marble and floral designs on glazed tiles. No more are peals of laughter heard there, nor the song warbled by ruby lips. All are gone who once imparted life to this lovely scene. The liveliest summer day the nightingale trills in the rose-bush and the turtle-dove coos in the *chenârs*, and the murmuring water dashes down its marble channels, but no one dwells there now save the solitary sentinel and the venerable guardian.

The Persians are a mercurial people, far different from most Orientals. They are passionately fond of poetry, and the stanzas of Ferdoûsee and Hafiz are familiar to all classes. Shah Djemsheed and Rustêm, the hero of the Shah-na-meh, or Chronicle of Kings, are household words, even more than the Cid in Spain or King Arthur in England. The Persians are also influenced by what appears to the eye beyond any other people. "If you wish to reach a Persian's heart you must touch his

eye," said a distinguished Persian. For this reason they are greatly taken with spectacular effects, and find it difficult to regard with respect foreigners who live in simple style and avoid display when abroad. Power that is unostentatious is to them difficult of comprehension.

If Teherân should ever have a theater or opera, and Persians should be permitted to attend them, they would develop a passion which at present finds only incomplete expression in numerous feasts or the mourning festivities of the Moharrem. The greatest annual occasion in Persia is probably the Noh Rooz, or New Year, which comes in the spring. This festival, although sanctioned by the Sheahs, undoubtedly had its origin in the time when the Zendavesta was the acknowledged guide of religion in Persia. The Noh Rooz comes when the sun again asserts his brilliant reign over the earth in March, and drives away clouds and rain and storm for nine months from its special favorite, the land of Irân. Then the trees burgeon and bloom, and the fields and gardens are resplendent with flowers. The Noh Rooz continues for ten days. One of these days is celebrated at Teherân with races held at the race-course outside the city walls. A handsome royal pavilion, furnished with arches and alcoves, affords a fine point of observation for the King and his wives, the latter guarded from view by lattices. The legations and principal Persian grandees erect tents adjoining the royal pavilion, and give receptions to their friends. The scene is gay with streamers and banners. The horses are fine steeds from the Arab breed of Shirâz, superb animals of grace and fire. But their gait is the run instead of the trot; the latter pace is not esteemed in the East for riding-horses, and justly, as it appears to me. Of course the entire population of Teherân turns out to see the races.

Another very important occasion at Teherân is what is called the Moharrem, or month of mourning. It is the celebration of the slaughter of Hussein, the son of Allee, and his family by the army of Moawiyeh, who had usurped the Caliphate. To the Sheahs the occasion is one of the highest importance. For nine days groups of fanatics, chiefly fakirs, go through the streets, chanting and howling "Ya Hussein!" Their clothes are rent, sometimes, indeed, entirely dispensed with, and their black locks hang disheveled over blood-shot eyes. With knives they gash themselves or pierce their limbs and cheeks with steel spikes, sometimes falling dead in the street from loss of blood. By the eighth, ninth, and tenth days these enthusiasts have wrought

themselves up to such a pitch of religious frenzy that it is prudent for Europeans to remain at home. He who has once seen one of these processions, or in the still of evening has heard the lamentation from all parts of the city, can never forget the singular impression produced.

A marked feature of the last days of the Moharrem is the Tazieh, or Passion Play, representing the death of Husseïn. Many of the wealthy Persians give presentations of the play in the court or patio of their own houses, which is covered with awnings, and all the faithful are invited to attend. To the women especially the opportunity of thus diverting themselves is so valuable, that this reason alone will probably render it difficult to abolish the custom for many years, were it, indeed, desirable to do so. But, of course, the royal Tazieh offers the most elaborate and complete representation of the Passion Play, if it may be so termed for want of a more descriptive phrase. The King has constructed a special building for this drama, surmounted by a light domical frame for supporting the awning. Galleries are ranged around the arena divided into boxes. Each minister is expected to furnish his loggia in a costly manner, with Cashmere shawls and elegant rugs.

Much of the representation reminds one of the scene in "Midsummer Night's Dream" where *Bottom* figures as the lion with *Moonshine* and his precious companions. A man brings a bush into the arena, sticks it in the ground, and says "This is a tree." Another actor on all fours, with a lion's skin on his back, personates the devouring king of beasts. Notwithstanding such absurdities, which the lively fancy of the spectators causes them to accept as real, the general effect becomes solemn and impressive as the tragedy proceeds and the martyrs are slain by a multitude of assailants. The audience is moved to tears, and a wild wailing proceeds from every quarter of the house. The impersonation has been sometimes carried to such a realistic point that men have allowed themselves to be buried up to the neck in the ground, or concealed their heads in a hole, in order to represent a field strewn with headless trunks and bloody heads. The effort was, however, so violent that actors representing such objects in the above manner have been known to be suffocated when the weather has been warm.

It appears singular to proceed from the Tazieh to the College of Teherân, the former representing Oriental and reactionary and the latter modern and Western ideas. Although the standard of instruction in the college leaves much to be desired, the existence of

such an institution indicates a progressive spirit, and must eventually produce valuable results for Persia. It is, of course, under government auspices; it includes instruction in languages, geology, painting, medicine, and other branches. Several of the instructors are Englishmen and Germans. The Persians show much aptitude in the acquisition of languages, and especially of the French tongue, which is understood and spoken by the King himself, and by many of his ministers and numerous subordinate officers. The study of anatomy is pursued with a manikin. It would be impossible to introduce dissection in Persia at present; and the practice of surgery, when involving amputation or complicated cases, is attended with difficulties, for if the surgeon should lose his patient, the latter being a Mussulman, he would be liable to pay what is called blood-money, and might even risk his own life.

Want of space forbids a further account of a city which offers the stranger many novel attractions. But we may allude, in closing, to the numerous charming villas, pleasure-houses, and retreats in the suburbs of Teherân. Doshantépê is a favorite resort of the King, three miles from the city. It is perched on the summit of a lofty, isolated rock, and is approached by a picturesque winding stairway. At the foot of the eminence lies a spacious garden containing an interesting menagerie composed largely of native animals. One observes there several noble lions from the vicinity of Persepolis. Another very interesting palace is that called Kasr-i-Khajâr or Castle of the Khajârs. It is one of the most pleasing objects in the landscapes of Teherân. The present Shah inherits the love of the chase peculiar to the monarchs of Persia from the oldest periods, and often resorts to these choice retreats in order to be in the neighborhood of his hunting-grounds.

The European colony spends the summer at the Shimrân in the villages of Tejrish, Gulahêk, and Zergendêh. The two latter were royal gifts to the English and Russian legations respectively. Besides the extensive grounds occupied by the two legations, these villages include houses rented to Europeans and Persians alike. The carriage-roads are numerous in the vicinity of Teherân, and most of them are excellent, and in several cases well protected by avenues of shade-trees. The most charming and romantic drive in the neighborhood is that of Yusufabâd. It gently ascends towards the mountains, and commands a superb prospect of Demavênd and the nearer ranges as well as the plains of Teherân far to the south beyond Kanaregîrd. When there is a slight haze or mirage, as often hap-

ROYAL THEATER, WHERE THE GREAT PASSION PLAY, OR TAZIEH, IS EXHIBITED ANNUALLY FOR TEN DAYS AT MOHARREM.
CURTAINS ARE DRAWN OVER THE FRAME-WORK ABOVE.

pens, the plain assumes the deep purple of the sea when a fresh breeze is blowing over it; the rosy ridges beyond resemble islands as seen at sea, and the white houses glistening here and there, mere gleaming specks, look like white-caps, while the walls of Teherân suggest surf beaten into foam on far-extending reefs.

S. G. W. Benjamin.

THE CRICKETS IN THE FIELDS.

ONE, or a thousand voices? — filling noon
 With such an undersong and drowsy chant
 As sings in ears that waken from a swoon,
 And know not yet which world such murmurs haunt:
 Single, then double beats, reiterant;
 Far off and near; one ceaseless, changeless tune.

If bird or breeze awake the dreamy will,
 We lose the song, as it had never been;
 Then suddenly we find 'tis singing still
 And had not ceased.—So, friend of mine, within
 My thoughts one underthought, beneath the din
 Of life, doth every quiet moment fill.

Thy voice is far, thy face is hid from me,
 But day and night are full of dreams of thee.

Anthony Morehead.

THE BOSTONIANS.*

BY HENRY JAMES,

Author of "Portrait of a Lady," "Daisy Miller," "Lady Barberina," etc.

XXXVIII.—(Continued.)

IT is to be feared, indeed, that Verena was easily satisfied (convinced, I mean, not that she ought to succumb to him, but that there were lovely, neglected, almost unsuspected truths on his side); and there is further evidence on the same head in the fact that after the first once or twice she found nothing to say to him (much as she was always saying to herself) about the cruel effect her apostasy would have upon Olive. She forbore to plead that reason after she had seen how angry it made him, and with how almost savage a contempt he denounced so flimsy a pretext. He wanted to know since when it was more becoming to take up with a morbid old maid than with an honorable young man; and when Verena pronounced the sacred name of friendship, he inquired what fanatical sophistry excluded him from a similar privilege. She had told him, in a moment of expansion (Verena believed she was immensely on her guard, but her guard was very apt to be lowered), that his visits to Marmion cast in Olive's view a remarkable light upon his chivalry; she chose to regard his resolute pursuit of Verena as a covert persecution of herself. Verena repented, as soon as she had spoken, of having given further currency to this taunt; but she perceived the next moment no harm was done, Basil Ransom taking in perfectly good part Miss Chancellor's reflections on his delicacy, and making them the subject of much free laughter. She could not know, for in the midst of his hilarity the young man did not compose himself to tell her, that he had made up his mind on this question before he left New York — as long ago as when he wrote her the note (subsequent to her departure from that city) to which allusion has already been made, and which was simply the fellow of the letter addressed to her after his visit to Cambridge; a friendly, respectful, yet rather pregnant sign that, decidedly, on second thoughts, separation didn't imply for him the intention of silence. We know a little about his second thoughts, as much as is essential, and especially how the occasion of their springing up had been the windfall of an editor's encour-

agement. The importance of that encouragement, to Basil's imagination, was doubtless much augmented by his desire for an excuse to take up again a line of behavior which he had forsworn (small as had, as yet, been his opportunity to indulge in it) very much less than he supposed; still, it worked a considerable revolution in his view of his case, and made him ask himself what amount of consideration he should (from the most refined Southern point of view) owe Miss Chancellor in the event of his deciding to go after Verena Tarrant in earnest. He was not slow to decide that he owed her none. Chivalry had to do with one's relations with people one hated, not with those one loved. He didn't hate poor Miss Olive, though she might make him, yet; and even if he did, any chivalry was all moonshine which should require him to give up the girl he adored in order that his third cousin should see he could be gallant. Chivalry was forbearance and generosity with regard to the weak; and there was nothing weak about Miss Olive; she was a fighting woman, and she would fight him to the death, giving him not an inch of odds. He felt that 'she was fighting there all day long, in her cottage-fortress; her resistance was in the air he breathed, and Verena came out to him, sometimes, quite limp and pale from the tussle.

It was in the same jocose spirit with which he regarded Olive's view of the sort of standard a Mississippian should live up to that he talked to Verena about the lecture she was preparing for her great début at the Music Hall. He learned from her that she was to take the field in the manner of Mrs. Farrinder, for a winter campaign, carrying with her a tremendous big gun. Her engagements were all made, her route was marked out; she expected to repeat her lecture in about fifty different places. It was to be called "A Woman's Reason," and both Olive and Miss Birdseye thought it, so far as they could tell in advance, her most promising effort. She wasn't going to trust to inspiration this time; she didn't want to meet a big Boston audience without knowing where she was. Inspiration, moreover, seemed rather to have faded away; in consequence of Olive's influence, she had read

* Copyright, 1884, by Henry James.

and studied so much that it seemed now as if everything must take form beforehand. Olive was a splendid critic, whether he liked her or not, and she had made her go over every word of her lecture twenty times. There wasn't an intonation she hadn't made her practice; it was very different from the old system, when her father had worked her up. If Basil considered women superficial, it was a pity he couldn't see what Olive's standard of preparation was, or be present at their rehearsals, in the evening, in their little parlor. Ransom's state of mind in regard to the event at the Music Hall was simply this — that he was determined to "head it off" if he could. He covered it with ridicule, in talking of it to Verena, and the shafts he leveled at it went so far that he could see she thought he exaggerated his dislike to it. In point of fact he could not have overstated that; so odious did the idea seem to him that she was soon to be launched in a more infatuated career. He vowed to himself that she should never take that fresh start which would commit her irretrievably if she should succeed, and she would succeed (he had not the slightest doubt of her power to produce a sensation in the Music Hall), to the acclamations of the newspapers. He didn't care for her engagements, her campaigns, or all the expectancy of her friends; to "smash" all that, at a stroke, was the dearest wish of his heart. It would represent to him his own success, it would symbolize his victory. It became a fixed idea with him, and he warned her again and again. When she laughed and said she didn't see how he could stop her unless he kidnapped her, he really pitied her for not perceiving, beneath his ominous pleasantries, the firmness of his resolution. He felt almost capable of kidnapping her. It was palpably in the air that she would become "widely popular," and that idea simply sickened him. He felt as differently as possible about it from Mr. Matthias Pardon.

One afternoon, as he returned with Verena from a walk which had been accomplished completely within the prescribed conditions, he saw, from a distance, Doctor Prance, who had emerged bareheaded from the cottage, and, shading her hands from the red, declining sun, was looking up and down the road. It was part of the regulation that Ransom should separate from Verena before reaching the house, and they had just paused to exchange their last words (which every day promoted the situation more than any others), when Doctor Prance began to beckon to them with much animation. They hurried forward, Verena pressing her hand to her heart, for she had instantly guessed that something terrible

had happened to Olive — she had given out, fainted away, perhaps fallen dead, with the cruelty of the strain. Doctor Prance watched them come, with a curious look in her face; it was not a smile, but a kind of mocking implication that she noticed nothing. In an instant she had told them what was the matter. Miss Birdseye had had a sudden weakness; she had remarked abruptly that she was dying, and her pulse, sure enough, had fallen to nothing. She was down on the piazza with Miss Chancellor and herself, and they had tried to get her up to bed. But she wouldn't let them move her; she was passing away, and she wanted to pass away just there, in such a pleasant place, in her customary chair, looking at the sunset. She asked for Miss Tarrant, and Miss Chancellor told her she was out — out walking with Mr. Ransom. Then she wanted to know if Mr. Ransom was still there — she supposed he was gone. (Basil knew, by Verena, apart from this, that his name had not been mentioned to the old lady since the morning he saw her.) She expressed a wish to see him — she had something to say to him; and Miss Chancellor told her that he would be back soon, with Verena, and that they would bring him in. Miss Birdseye said she hoped they wouldn't be long, because she was sinking; and Doctor Prance now added, like a person who knew what she was talking about, that it was, in fact, the end. She had darted out two or three times to look for them, and they must step in right off. Verena had scarcely given her time to tell her story; she had already rushed into the house. Ransom followed with Doctor Prance, conscious that for him the occasion was doubly solemn; inasmuch as if he was to see poor Miss Birdseye yield up her philanthropic soul, he was on the other hand doubtless to receive from Miss Chancellor a reminder that *she* had no intention of quitting the game.

By the time he had made this reflection he stood in the presence of Miss Chancellor and her venerable guest, who was sitting just as he had seen her before, muffled and bonneted, on the back piazza of the cottage. Olive Chancellor was on one side of her, holding one of her hands, and on the other was Verena, who had dropped on her knees, close to her, bending over those of the old lady. "Did you ask for me — did you want me?" the girl said, tenderly. "I will never leave you again."

"Oh, I won't keep you long. I only wanted to see you once more." Miss Birdseye's voice was very low, like that of a person breathing with difficulty; but it had no painful nor querulous note — it expressed only the cheer-

ful weariness which had marked all this last period of her life, and which seemed to make it, now, as blissful as it was suitable that she should pass away. Her head was thrown back against the top of the chair, the ribbon which confined her ancient hat hung loose, and the late afternoon light covered her octogenarian face and gave it a kind of fairness, a double placidity. There was, to Ransom, something almost august in the trustful renunciation of her countenance; something in it seemed to say that she had been ready long before, but as the time was not ripe she had waited, with her usual faith that all was for the best; only, at present, since the right conditions met, she couldn't help feeling that it was quite a luxury, the greatest she had ever tasted. Ransom knew why it was that Verena had tears in her eyes as she looked up at her patient old friend; she had spoken to him, often, during the last three weeks, of the stories Miss Birdseye had told her of the great work of her life, her mission, repeated year after year, among the Southern blacks. She had gone among them with every precaution, to teach them to read and write; she had carried them Bibles and told them of the friends they had in the North who prayed for their deliverance. Ransom knew that Verena didn't reproduce these legends with a view to making him ashamed of his Southern origin, his connection with people who, in a past not yet remote, had made that kind of apostleship necessary; he knew this because she had heard what he thought of all that chapter himself; he had given her a kind of historical summary of the slavery question which left her no room to say that he was more tender to that particular example of human imbecility than he was to any other. But she had told him that this was what *she* would have liked to do — to wander, alone, with her life in her hand, on an errand of mercy, through a country in which society was arrayed against her; she would have liked it much better than simply talking about the right from the gas-lighted vantage of the New England platform. Ransom had replied simply "Balderdash!" it being his theory, as we have perceived, that he knew much more about Verena's native bent than the young lady herself. This did not, however, as he was perfectly aware, prevent her feeling that she had come too late for the heroic age of New England life, and regarding Miss Birdseye as a battered, immemorial monument of it. Ransom could share such an admiration as that, especially at this moment; he had said to Verena, more than once, that he wished that he might have met the old lady in Carolina or Georgia before the war — shown her round among the negroes

and talked over New England ideas with her; there were a good many he didn't care much about now, but at that time they would have been tremendously refreshing. Miss Birdseye had given herself away so lavishly all her life that it was rather odd there was anything left of her for the supreme surrender. When he looked at Olive he saw that she meant to ignore him; and during the few minutes he remained on the spot his kinswoman never met his eye. She turned away, indeed, as soon as Doctor Prance said, leaning over Miss Birdseye, "I have brought Mr. Ransom to you. Don't you remember you asked for him?"

"I am very glad to see you again," Ransom remarked. "It was very good of you to think of me." At the sound of his voice Olive rose and left her place; she sank into a chair at the other end of the piazza, turning round to rest her arms on the back and bury her head in them.

Miss Birdseye looked at the young man still more dimly than she had ever done before. "I thought you were gone. You never came back."

"He spends all his time in long walks; he enjoys the country so much," Verena said.

"Well, it's very beautiful, what I see from here. I haven't been strong enough to move since the first days. But I am going to move now." She smiled when Ransom made a gesture as if to help her, and added: "Oh, I don't mean I am going to move out of my chair."

"Mr. Ransom has been out in a boat with me several times. I have been showing him how to cast a line," said Doctor Prance, who appeared to deprecate too solemn a tone.

"Oh, well, then, you have been one of our party; there seems to be every reason why you should feel that you belong to us." Miss Birdseye looked at the visitor with a sort of misty earnestness, as if she wished to communicate with him further; then her glance turned slightly aside; she tried to see what had become of Olive. She perceived that Miss Chancellor had withdrawn herself, and, closing her eyes, she mused, ineffectually, on the mystery she had not grasped, the peculiarity of Basil Ransom's relations with his kinswoman. She was visibly too weak to concern herself with it very actively; she only felt, now that she seemed really to be going, a desire to reconcile and harmonize. But she presently exhaled a low, soft sigh — a kind of confession that it was too mixed, that she gave it up. Ransom had feared for a moment that she was about to indulge in some appeal to Olive, some attempt to make him join hands with that young lady, as a supreme satisfaction to herself. But he saw that her

strength failed her, and that, besides, things were getting less clear to her; to his considerable relief, inasmuch as, though he would not have objected to joining hands, the expression of Miss Chancellor's figure and her averted face, with their desperate collapse, showed him well enough how *she* would have met such a proposal. What Miss Birdseye clung to, with benignant perversity, was the idea that, in spite of his exclusion from the house, which was perhaps only the result of a certain high-strung jealousy on Olive's part of her friend's other personal ties, Verena had drawn him in, had made him sympathize with the great reform and desire to work for it. Ransom saw no reason why such an illusion should be dear to Miss Birdseye; his contact with her in the past had been so momentary that he could not account for her taking an interest in his views, in his throwing his weight into the right scale. It was part of the general desire for justice that fermented within her, the passion for progress; and it was also in some degree her interest in Verena—a suspicion, innocent and idyllic, as any such suspicion on Miss Birdseye's part must be, that there was something between them, that the closest of all unions (as Miss Birdseye at least supposed it was) was preparing itself. Then his being a Southerner gave a point to the whole thing; to bring round a Southerner would be a real encouragement for one who had seen, even at a time when she was already an old woman, what was the state of opinion in the cotton States. Ransom had no wish to discourage her, and he bore well in mind the caution Doctor Prance had given him about destroying her last illusion. He only bowed his head very humbly, not knowing what he had done to earn the honor of being the subject of it. His eyes met Verena's as she looked up at him from her place at Miss Birdseye's feet, and he saw she was following his thought, throwing herself into it, and trying to communicate to him a wish. The wish touched him immensely; she was dreadfully afraid he would betray her to Miss Birdseye—let her know how she had cooled off. Verena was ashamed of that now, and trembled at the danger of exposure; her eyes adjured him to be careful of what he said. Her tremor made him glow a little in return, for it seemed to him the fullest confession of his influence she had yet made.

"We have been a very happy little party," she said to the old lady. "It is delightful that you should have been able to be with us all these weeks."

"It has been a great rest. I am very tired. I can't speak much. It has been a lovely time. I have done so much—so many things."

"I guess I wouldn't talk much, Miss Birdseye," said Doctor Prance, who had now knelt down the other side of her. "We know how much you have done. Every one knows *your* life!"

"It isn't much—only I tried to take hold. When I look back from here, from where we've sat, I can measure the progress. That's what I wanted to say to you and Mr. Ransom—because I'm going fast. Hold on to me, that's right; but you can't keep me. I don't want to stay now; I presume I shall join some of the others that we lost long ago. Their faces come back to me now, quite fresh. You mustn't think there's no progress because you don't see it all right off; that's what I wanted to say. It isn't till you have gone a long way that you can feel what's been done. That's what I see when I look back from here; I see that the community wasn't half waked up when I was young."

"It is you that have waked it up more than any one else, and it's for that we honor you, Miss Birdseye!" Verena cried, with a sudden violence of emotion. "If you were to live for a thousand years, you would think only of others—you would think only of helping on humanity. You are our heroine, you are our saint, and there is no one like you!" Verena had no glance for Ransom now, and there was neither deprecation nor entreaty in her face. A wave of contrition, of shame, had swept over her—a quick desire to atone for her secret swerving by a renewed recognition of the nobleness of such a life as Miss Birdseye's.

"Oh, I haven't effected very much; I have only cared and hoped. You will do more than I have ever done—you and Olive Chancellor, because you are young and bright, brighter than I ever was; and besides, everything has got started."

"Well, you've got started, Miss Birdseye," Doctor Prance remarked, with raised eyebrows, protesting dryly but kindly, and putting forward, with an air as if, after all, it didn't matter much, an authority that had been superseded. The manner in which this competent little woman humored her patient showed sufficiently that the good lady was sinking fast.

"We will think of you always, and that will teach us singleness and devotion," Verena went on, in the same tone, still not meeting Ransom's eyes again, and speaking as if she were trying now to stop herself, to tie herself by a vow.

"Well, it's the thing you and Olive have given your lives to that has absorbed me most, of late years. I did want to see justice done—to us. I haven't seen it, but you will. And Olive will. Where is she—why isn't

she near me? And Mr. Ransom will — and he will be proud to have helped."

"Oh, mercy, mercy!" cried Verena, burying her head in Miss Birdseye's lap.

"You are not mistaken if you think I desire above all things that your weakness, your generosity, should be protected," Ransom said, rather ambiguously, but with pointed respectfulness. "I shall remember you as an example of what women are capable of," he added; and he had no subsequent compunctions for the speech, for he thought poor Miss Birdseye, for all her absence of profile, essentially feminine.

A kind of frantic moan from Olive Chancellor responded to these words, which had evidently struck her as an insolent mockery; and at the same moment Doctor Prance sent Ransom a glance which was an adjuration to depart.

"Good-bye, Olive Chancellor," Miss Birdseye murmured. "I don't want to stay, though I should like to see what you will see."

"I shall see nothing but shame and ruin!" Olive shrieked, rushing across to her old friend, while Ransom discreetly quitted the scene.

XXXIX.

HE met Doctor Prance in the village the next morning, and as soon as he looked at her he saw that the event which had been impending at Miss Chancellor's had taken place. It was not that her aspect was funereal; but it contained, somehow, an implication that she had, for the present, no more thought to give to casting a line. Miss Birdseye had quietly passed away, in the evening, an hour or two after Ransom's visit. They had wheeled her chair into the house; there had been nothing to do but wait for complete extinction. Miss Chancellor and Miss Tarrant had sat by her there, without moving, each of her hands in theirs, and she had just melted away, towards eight o'clock. It was a lovely death; Doctor Prance intimated that she had never seen any that she thought more seasonable. She added that she was a good woman — one of the old sort; and that was the only funeral oration that Basil Ransom was destined to hear pronounced upon Miss Birdseye. The impression of the simplicity and humility of her end remained with him, and he reflected more than once, during the days that followed, that the absence of pomp and circumstance which had marked her career marked also the consecration of her memory. She had been almost celebrated, she had been active, earnest, ubiquitous beyond anyone else, she had given herself utterly to charities and creeds and causes; and yet the only persons, apparently, to whom her

death made a real difference were three young women in a small "frame house" on Cape Cod. Ransom learned from Doctor Prance that her mortal remains were to be committed to their rest in the little cemetery at Marmion, in sight of the pretty sea-view she loved to gaze at, among old mossy head-stones of mariners and fisher-folk. She had seen the place when she first came down, when she was able to drive out a little, and she had said she thought it must be pleasant to lie there. It wasn't an injunction, a definite request; it had not occurred to Miss Birdseye, at the end of her days, to take an exacting line or to make, for the first time in eighty years, a personal claim. But Olive Chancellor and Verena had put their construction on her appreciation of the quietest corner of the striving, suffering world so weary a pilgrim of philanthropy had ever beheld.

In the course of the day Ransom received a note of five lines from Verena, the purport of which was to tell him that he must not expect to see her again for the present; she wished to be very quiet and think things over. She added the recommendation that he should leave the neighborhood for three or four days; there were plenty of strange old places to see in that part of the country. Ransom meditated deeply on this missive, and perceived that he should be guilty of very bad taste in not immediately absenting himself. He knew that to Olive Chancellor's vision his conduct already wore that stain, and it was useless, therefore, for him to consider how he could displease her either less or more. But he wished to convey to Verena the impression that he would do anything in the wide world to gratify *her* except give her up, and as he packed his valise he had an idea that he was both behaving beautifully and showing the finest diplomatic sense. To go away proved to himself how secure he felt, what a conviction he had that however she might turn and twist in his grasp he held her fast. The emotion she had expressed as he stood there before poor Miss Birdseye was only one of her instinctive contortions; he had taken due note of that — said to himself that a good many more would probably occur before she would be quiet. A woman that listens is lost, the old proverb says; and what had Verena done for the last three weeks but listen? — not very long each day, but with a degree of attention of which her not withdrawing from Marmion was the measure. She had not told him that Olive wanted to whisk her away, but he had not needed this confidence to know that if she staid on the field it was because she preferred to. She probably had an idea she was fighting, but

if she should fight no harder than she had fought up to now, he should continue to take the same view of his success. She meant her request that he should go away for a few days as something combative; but, decidedly, he scarcely felt the blow. He liked to think that he had great tact with women, and he was sure Verena would be struck with this quality in reading, in the note he presently addressed her in reply to her own, that he had determined to take a little run to Provincetown. As there was no one under the rather ineffectual roof which sheltered him to whose hand he could intrust the billet,—at the Marmion hotel one had to be one's own messenger,—he walked to the village post-office to request that his note should be put into Miss Chancellor's box. Here he met Doctor Prance, for a second time that day; she had come to deposit the letters by which Olive notified a few of Miss Birdseye's friends of the time and place of her obsequies. This young lady was shut up with Verena, and Doctor Prance was transacting all their business for them. Ransom felt that he made no admission that would impugn his estimate of the sex to which she in a manner belonged, in reflecting that she would acquit herself of these delegated duties with the greatest rapidity and accuracy. He told her he was going to absent himself for a few days, and expressed a friendly hope that he should find her at Marmion on his return.

Her keen eye gauged him a moment, to see if he were joking; then she said, "Well, I presume you think I can do as I like. But I can't."

"You mean you have got to go back to work?"

"Well, yes; my place is empty in the city."

"So is every other place. You had better remain till the end of the season."

"It's all one season to me. I want to see my office-slate. I wouldn't have staid so long for any one but her."

"Well, then, good-bye," Ransom said. "I shall always remember our little expeditions. And I wish you every professional distinction."

"That's why I want to go back," Doctor Prance replied, with her flat, limited manner. He kept her a moment; he wanted to ask her about Verena. While he was hesitating how to form his question she remarked, evidently wishing to leave him a little memento of her sympathy, "Well, I hope you will be able to follow up your views."

"My views, Miss Prance? I am sure I have never mentioned them to *you*!" Then Ransom added, "How is Miss Tarrant to-day? is she more calm?"

"Oh, no, she isn't calm at all," Doctor Prance answered, very definitely.

"Do you mean she's excited, emotional?"

"Well, she doesn't talk, she's perfectly still, and so is Miss Chancellor. They're as still as two watchers—they don't speak. But you can hear the silence vibrate."

"Vibrate?"

"Well, they are very nervous."

Ransom was confident, as I say; yet the effort that he made to extract a good omen from this characterization of the two ladies at the cottage was not altogether successful. He would have liked to ask Doctor Prance whether she didn't think he might count on Verena in the end; but he was too shy for this, the subject of his relations with Miss Tarrant never yet having been touched upon between them; and, besides, he didn't care to hear himself put a question which was more or less an implication of a doubt. So he compromised, with a sort of oblique and general inquiry about Olive; that might draw some light. "What do you think of Miss Chancellor—how does she strike you?"

Doctor Prance reflected a little, with an apparent consciousness that he meant more than he asked. "Well, she's losing flesh," she presently replied; and Ransom turned away, not encouraged, and feeling that, no doubt, the little doctress had better go back to her office-slate.

He did the thing handsomely, remained at Provincetown a week, inhaling the delicious air, smoking innumerable cigars, and lounging among the ancient wharves, where the grass grew thick and the impression of fallen greatness was still stronger than at Marmion. Like his friends the Bostonians he was very nervous; there were days when he felt that he must rush back to the margin of that mild inlet; the voices of the air whispered to him that in his absence he was being outwitted. Nevertheless, he staid the time he had determined to stay; quieting himself with the reflection that there was nothing they could do to elude him unless, perhaps, they should start again for Europe, which they were not likely to do. If Miss Olive tried to hide Verena away in the United States, he would undertake to find her—though he was obliged to confess that a flight to Europe would baffle him, owing to his want of cash for pursuit. Nothing, however, was less probable than that they would cross the Atlantic on the eve of Verena's projected *début* at the Music Hall. Before he went back to Marmion he wrote to this young lady, to announce his reappearance there and let her know that he expected she would come out to meet him the morning afterward. This was an implication that he

intended to take as much of the day as he could get; he had had enough of the system of dragging through all the hours till a mere fraction of time was left before night, and he couldn't wait so long, at any rate, the day after his return. It was the afternoon train that had brought him back from Provincetown, and in the evening he ascertained that the Bostonians had not deserted the field. There were lights in the windows of the house under the elms, and he stood where he had stood that evening with Doctor Prance and listened to the waves of Verena's voice, as she rehearsed her lecture. There were no waves this time, no sounds, and no sign of life but the lamps; the place had apparently not ceased to be given over to the vibrating silence described by Doctor Prance. Ransom felt that he gave an immense proof of chivalry in not calling upon Verena to grant him an interview on the spot. She had not answered his last note, but the next day she came out to meet him at the hour he had proposed; he saw her advance along the road, in a white dress, under a big parasol, and again he found himself liking immensely the way she walked. He was dismayed, however, at her face and what it portended; pale, with red eyes, graver than she had ever been before, she appeared to have spent the period of his absence in violent weeping. Yet that it was not for him she had been crying was proved by the very first words she spoke.

"I only came out to tell you definitely it's impossible! I have thought over everything, taking plenty of time — over and over; and that is my answer, finally, positively. You must take it — you shall have no other."

Basil Ransom gazed, frowning fearfully. "And why not, pray?"

"Because I can't, I can't, I can't, I can't!" she repeated passionately, with her altered, distorted face.

"Damnation!" murmured the young man. He seized her hand, drew it into his arm, forcing her to walk with him along the road.

That afternoon Olive Chancellor came out of her house and wandered for a long time upon the shore. She looked up and down the bay, at the sails that gleamed on the blue water, shifting in the breeze and the light; they were a source of interest to her that they had never been before. It was a day she was destined never to forget; she felt it to be the saddest, the most wounding of her life. Unrest and haunting fear had not possession of her now, as they had held her in New York when Basil Ransom carried off Verena, to mark her for his own, in the park. But an immeasurable load of misery seemed to sit upon her soul; she ached with the bitterness of her

melancholy, she was dumb and cold with despair. She had spent the violence of her terror, the eagerness of her grief, and now she was too weary to struggle with fate. She appeared to herself almost to have accepted it, as she wandered forth in the beautiful afternoon with the knowledge that the "ten minutes" which Verena had told her she meant to devote to Mr. Ransom that morning had developed suddenly into an embarkation for the day. They had gone out in a boat together; one of the village worthies, from whom small craft were to be hired, had, at Verena's request, sent his little son to Miss Chancellor's cottage with that information. She had not understood whether they had taken the boatman with them. Even when it came (and it came at a moment of considerable reassurance) Olive's nerves were not plowed up by it as they had been, for instance, by the other expedition, in New York; and she could measure the distance she had traversed since then. It had not driven her away on the instant to pace in frenzy on the shore, to hail every boat that passed, and beg that the young lady who was sailing somewhere in the bay with a dark gentleman, with long hair, should be entreated immediately to return. On the contrary, after the first quiver of pain inflicted by the news she had been able to occupy herself, to look after her house, to write her morning's letters, to go into her accounts, which she had had some time on her mind. She had wanted to put off thinking, for she knew to what hideous recognitions that would bring her round again. These were summed up in the fact that Verena was now not to be trusted for an hour. She had sworn to her the night before, with a face like a wounded angel's, that her choice was made, that their union and their work was more to her than any other life could ever be, and that she deeply believed that should she forswear these holy things she should simply waste away, in the end, with remorse and shame. She would see Mr. Ransom just once more, for ten minutes, to utter one or two supreme truths to him, and then they would take up their old, happy, active, fruitful days again, would throw themselves more than ever into their splendid effort. Olive had seen how Verena was moved by Miss Birdseye's death, how at the sight of that unique woman's majestically simple withdrawal from a scene in which she had held every vulgar aspiration, every worldly standard and lure, so cheap, the girl had been touched again with the spirit of their most confident hours, had flamed up with the faith that no narrow personal joy could compare in sweetness with the idea of doing something for those who had always suffered and who waited still. This helped Olive to

believe that she might begin to count upon her again, conscious as she was at the same time that Verena had been strangely weakened and strained by her odious ordeal. Oh, Olive knew that she loved him—knew what the passion was with which the wretched girl had to struggle; and she did her the justice to believe that her professions were sincere, her effort was real. Harassed and embittered as she was, Olive Chancellor still proposed to herself to be rigidly just, and that is why she pitied Verena now with an unspeakable pity, regarded her as the victim of a malevolent spell, and reserved all her execration and contempt for the author of their common misery. If Verena had stepped into a boat with him half an hour after declaring that she would give him his dismissal in twenty words, that was because he had ways, known to himself and other men, of creating situations without an issue, of forcing her to do things she could do only with sharp repugnance, under the menace of pain that would be sharper still. But all the same, what actually stared her in the face was that Verena was not to be trusted, even after rallying again as passionately as she had done during the days that followed Miss Birdseye's death. Olive would have liked to know the pang of penance that *she* would have been afraid, in her place, to incur; to see the locked door which *she* would not have managed to force open!

This inexpressibly mournful sense that, after all, Verena, in her exquisite delicacy and generosity, was appointed only to show how women had from the beginning of time been the sport of men's selfishness and avidity, this dismal conviction accompanied Olive on her walk, which lasted all the afternoon, and in which she found a kind of tragic relief. She went very far, keeping in the lonely places, unveiling her face to the splendid light, which seemed to make a mock of the darkness and heaviness of her spirit. There were little sandy coves, where the rocks were clean, where she made long stations, sinking down in them as if she hoped she should never rise again. It was the first time she had been out since Miss Birdseye's death, except the hour when, with the dozen sympathizers who came from Boston, she stood by the tired old woman's grave. Since then, for three days, she had been writing letters, narrating, describing to those who hadn't come; there were some, she thought, who might have managed to do so, instead of dispatching her pages of diffuse reminiscence and asking her for all particulars in return. Selah Tarrant and his wife had come, obtrusively, as she thought, for they never had had very much intercourse with Miss Birdseye; and if it was for Verena's

sake, Verena was there to pay every tribute herself. Mrs. Tarrant had evidently hoped Miss Chancellor would ask her to stay on at Marmion, but Olive felt how little she was in a state for such heroics of hospitality. It was precisely in order that she should not have to do that sort of thing that she had given Selah such considerable sums, on two occasions, at a year's interval. If the Tarrants wanted a change of air, they could travel all over the country—their present means permitted it; they could go to Saratoga or Newport if they liked. Their appearance showed that they could put their hands into their pockets (or into hers); at least Mrs. Tarrant's did. Selah still sported (on a hot day in August) his immemorial water-proof; but his wife rustled against the low tombstones at Marmion in garments of which (little as she was versed in such inquiries) Olive could see that the cost had been large. Besides, after Doctor Prance had gone (when all was over), she felt what a relief it was that Verena and she could be just together—together with the monstrous wedge of a question that had come up between them. That was company enough, great Heaven! and she had not got rid of such an inmate as Doctor Prance only to put Mrs. Tarrant in her place.

Did Verena's strange aberration, on this particular day, suggest to Olive that it was no use striving, that the world was all a great trap or trick, of which women were ever the punctual dupes, so that it was the worst of the curse that rested upon them that they must most humiliate those who had most their cause at heart? Did she say to herself that their weakness was not only lamentable but hideous—hideous their predestined subjection to man's larger and grosser insistence? Did she ask herself why she should give up her life to save a sex which, after all, didn't wish to be saved, and which rejected the truth even after it had bathed them with its auroral light, and they had pretended to be fed and fortified? These are mysteries into which I shall not attempt to enter, speculations with which I have no concern; it is sufficient for us to know that all human effort had never seemed to her so barren and thankless as on that afternoon. Her eyes rested on the boats she saw in the distance, and she wondered if in one of them Verena were floating to her fate; but so far from straining forward to beckon her home, she almost wished that she might glide away for ever, that *she* might never see her again, never undergo the horrible details of a more deliberate separation. Olive lived over, in her miserable musings, her life for the last two years; she knew, again, how noble and beautiful her scheme had been, but how

it had all rested on an illusion the very thought of which made her feel faint and sick. What was before her now was the reality, with the beautiful, indifferent sky pouring down its complacent rays upon it. The reality was simply that Verena had been more to her than she ever was to Verena, and that, with her exquisite natural art, the girl had cared for their cause only because, for the time, no interest, no fascination was greater. Her talent, the talent which was to achieve such wonders, was nothing to her; it was too easy; she could leave it alone, as she might close her piano, for months; it was only to Olive that it was everything. Verena had submitted, she had responded, she had lent herself to Olive's incitement and exhortation, because she was sympathetic and young and abundant and fanciful; but it had been a kind of hot-house loyalty, the mere contagion of example, and a sentiment springing up from within had easily breathed a chill upon it. Did Olive ask herself whether, for so many months, her companion had been only the most unconscious and most successful of humbugs? Here again I must plead a certain incompetence to give an answer. Positive it is that she spared herself none of the inductions of a reverie that seemed to dry up the mists and ambiguities of life. These hours of backward clearness come to all men and women, once at least, when they read the past in the light of the present, with the reasons of things, like unobserved finger-posts, protruding where they never saw them before. The journey behind them is mapped out and figured with its false steps, its wrong observations, all its infatuated, deluded geography. They understand as Olive understood, but it is probable that they rarely suffer as she suffered. The sense of regret for her baffled calculations burned within her like a fire, and the splendor of the vision over which the curtain of mourning now was dropped brought to her eyes slow, still tears, tears that came one by one, neither easing her nerves nor lightening her load of pain. She thought of her innumerable talks with Verena, of the pledges they had exchanged, of their earnest studies, their faithful work, their certain reward, the winter nights under the lamp, when they thrilled with previsions as just and a passion as high as had ever found shelter in a pair of human hearts. The pity of it, the misery of such a fall after such a flight, could express itself only, as the poor girl prolonged the vague pauses of her unnoticed ramble, in a low, inarticulate murmur of anguish.

The afternoon waned, bringing with it the slight chill which, at the summer's end, begins to mark the shortening days. She turned her

face homeward, and by this time became conscious that if Verena's companion had not yet brought her back there might be ground for uneasiness as to what had happened to them.

It seemed to her that no sail-boat could have put into the town without passing more or less before her eyes and showing her whom it carried; she had seen a dozen, freighted only with the figures of men. An accident was perfectly possible (what could Ransom, with his plantation habits, know about the management of a sail?), and once that danger loomed before her — the signal loveliness of the weather had prevented its striking her before — Olive's imagination hurried, with a bound, to the worst. She saw the boat overturned and drifting out to sea, and (after a week of nameless horror) the body of an unknown young woman, defaced beyond recognition, but with long auburn hair and in a white dress, washed up in some far-away cove. An hour before, her mind had rested with a sort of relief on the idea that Verena should sink forever beneath the horizon, so that their tremendous trouble might never be; but now, with the lateness of the hour, a sharp, immediate anxiety took the place of that intended resignation; and she quickened her step, with a heart that galloped too as she went. Then it was, above all, that she felt how *she* had understood friendship, and how never again to see the face of the creature she had taken to her soul would be for her as the stroke of blindness. The twilight had become thick by the time she reached Marmion and paused for an instant in front of her house, over which the elms that stood on the grassy wayside appeared to her to hang a blacker curtain than ever before.

There was no candle in any window, and when she pushed in and stood in the hall, listening a moment, her step awakened no answering sound. Her heart failed her; Verena's staying out in a boat from ten o'clock in the morning till nightfall was too unnatural, and she gave a cry, as she rushed into the low, dim parlor (darkened on one side, at that hour, by the wide-armed foliage, and on the other by the veranda and trellis), which expressed only a wild personal passion, a desire to take her friend in her arms again on any terms, even the most cruel to herself. The next moment she started back, with another and a different exclamation, for Verena was in the room, motionless, in a corner, — the first place in which she had seated herself on reëntering the house, — looking at her with a silent face which seemed strange, unnatural, in the dusk. Olive stopped short, and for a minute the two women remained as they were, gazing at each other in the dimness. After that, too, Olive still said nothing; she only went to Verena

and sat down beside her. She didn't know what to make of her manner; she had never been like that before. She was unwilling to speak; she seemed crushed and humbled. This was almost the worst — if anything could be worse than what had gone before; and Olive took her hand with an irresistible impulse of compassion and reassurance. * From the way it lay in her own she guessed her whole feeling — saw it was a kind of shame, shame for her weakness, her swift surrender, her insane gyration, in the morning. Verena expressed it by no protest and no explanation; she appeared not even to wish to hear the sound of her own voice. Her silence itself was an appeal — an appeal to Olive to ask no questions (she could trust her to inflict no spoken reproach); only to wait till she could lift up her head again. Olive understood, or thought she understood, and the wofulness of it all only seemed the deeper. She would just sit there and hold her hand; that was all she could do; they were beyond each other's help in any other way now. Verena leaned her head back and closed her eyes, and for an hour, as nightfall settled in the room, neither of the young women spoke. Distinctly, it was a kind of shame. After a while the parlor-maid, very casual, in the manner of the servants at Marmion, appeared on the threshold with a lamp; but Olive motioned her frantically away. She wished to keep the darkness. It was a kind of shame.

The next morning Basil Ransom rapped loudly with his walking-stick on the lintel of Miss Chancellor's house-door, which, as usual on fine days, stood open. There was no need he should wait till the servant had answered his summons; for Olive, who had reason to believe he would come, and who had been lurking in the sitting-room for a purpose of her own, stepped forth into the little hall.

"I am sorry to disturb you; I had the hope that — for a moment — I might see Miss Tarrant." That was the speech with which (and a measured salutation) he greeted his advancing kinswoman. She faced him an instant, and her strange green eyes caught the light.

"It's impossible. You may believe that when I say it."

"Why is it impossible?" he asked, smiling in spite of an inward displeasure. And as Olive gave him no answer, only gazing at him with a cold audacity which he had not hitherto observed in her, he added a little explanation. "It is simply to have seen her before I go — to have said five words to her. I want her to know that I have made up my mind — since yesterday — to leave this place; I shall take the train at noon."

It was not to gratify Olive Chancellor that he had determined to go away, or even that he told her this; yet he was surprised that his words brought no expression of pleasure to her face. "I don't think it is of much importance whether you go away or not. Miss Tarrant herself has gone away."

"Miss Tarrant — gone away?" This announcement was so much at variance with Verena's apparent intentions the night before that his ejaculation expressed chagrin as well as surprise, and in doing so it gave Olive a momentary advantage. It was the only one she had ever had, and the poor girl may be excused for having enjoyed it — so far as enjoyment was possible to her. Basil Ransom's visible discomfiture was more agreeable to her than anything had been for a long time.

"I went with her myself to the early train; and I saw it leave the station." And Olive kept her eyes unaverted, for the satisfaction of seeing how he took it.

It must be confessed that he took it rather ill. He had decided it was best he should retire, but Verena's retiring was another matter. "And where is she gone?" he asked, with a frown.

"I don't think I am obliged to tell you."

"Of course not! Excuse my asking. It is much better that I should find it out for myself, because if I owed the information to you I should perhaps feel a certain delicacy as regards profiting by it."

"Gracious Heaven!" cried Miss Chancellor, at the idea of Ransom's delicacy. Then she added more deliberately: "You will not find out for yourself."

"You think not?"

"I am sure of it!" And her enjoyment of the situation becoming acute, there broke from her lips a shrill, unfamiliar, troubled sound, which performed the office of a laugh, a laugh of triumph, but which, at a distance, might have passed almost as well for a wail of despair. It rang in Ransom's ears as he quickly turned away.

XL.

It was Mrs. Luna who received him, as she had received him on the occasion of his first visit to Charles street; by which I do not mean quite in the same way. She had known very little about him then, but she knew too much for her happiness to-day, and she had with him now a little invidious, contemptuous manner, as if everything he should say or do could be a proof only of abominable duplicity and perversity. She had a theory that he had treated her shamefully; and he knew it — I do not mean the fact, but the theory; which led

him to reflect that her resentments were as shallow as her opinions, inasmuch as if she really believed in her grievance, or if it had had any dignity, she would not have consented to see him. He had not presented himself at Miss Chancellor's door without a very good reason, and having done so, he could not turn away so long as there was any one in the house of whom he might have speech. He had sent up his name to Mrs. Luna, after being told that she was staying there, on the mere chance that she would see him; for he thought a refusal a very possible sequel to the letters she had written him during the past four or five months — letters he had scarcely read, full of allusions of the most cutting sort to proceedings of his, in the past, of which he had no recollection whatever. They bored him, for he had quite other matters in his mind.

"I don't wonder you have the bad taste, the crudity," she said, as soon as he came into the room, looking at him more sternly than he would have believed possible to her.

He saw that this was an allusion to his not having been to see her since the period of her sister's visit to New York; he having conceived for her, the evening of Mrs. Burrage's party, a sentiment of aversion which put an end to such attentions. He didn't laugh, he was too worried and preoccupied; but he replied in a tone which apparently annoyed her as much as any indecent mirth: "I thought it very possible you wouldn't see me."

"Why shouldn't I see you, if I should take it into my head? Do you suppose I care whether I see you or not?"

"I supposed you wanted to, from your letters."

"Then why did you think I would refuse?"

"Because that's the sort of thing women do."

"Women — women! You know much about them!"

"I am learning something every day."

"You haven't learned yet, apparently, to answer their letters. It's rather a surprise to me that you don't pretend not to have received mine."

Ransom could smile now; the opportunity to vent the exasperation that had been consuming him almost restored his good humor. "What could I say? You overwhelmed me. Besides, I did answer one of them."

"One of them? You speak as if I had written you a dozen!" Mrs. Luna cried.

"I thought that was your contention — that you had done me the honor to address me so many. They were crushing, and when a man's crushed, it's all over."

"Yes, you look as if you were in very small pieces! I am glad I shall never see you again."

"I can see now why you received me — to tell me that," Ransom said.

"It is a kind of pleasure. I am going back to Europe."

"Really? for Newton's education?"

"Ah, I wonder you can have the face to speak of that — after the way you deserted him!"

"Let us abandon the subject, then, and I will tell you what I want."

"I don't in the least care what you want," Mrs. Luna remarked. "And you haven't even the grace to ask me where I am going — over there."

"What difference does that make to me — once you leave these shores?"

Mrs. Luna rose to her feet. "Ah, chivalry! chivalry!" she exclaimed. And she walked away to the window — one of the windows from which Ransom had first enjoyed, at Olive's solicitation, the view of the Back Bay. Mrs. Luna looked forth at it with little of the air of a person who was sorry to be about to lose it. "I am determined you shall know where I am going," she said in a moment. "I am going to Florence."

"Don't be afraid!" he replied. "I shall go to Rome."

"And you'll carry there more impertinence than has been seen there since the old emperors."

"Were the emperors impertinent in addition to their other vices? I am determined, on my side, that you shall know what I have come for," Ransom said. "I wouldn't ask you if I could ask any one else; but I am very hard pressed, and I don't know who can help me."

Mrs. Luna turned on him a face of the frankest derision. "Help you? Do you remember the last time I asked you to help me?"

"That evening at Mrs. Burrage's? Surely I wasn't wanting then; I remember urging on your acceptance a chair, so that you might stand on it, to see and to hear."

"To see and to hear what, please? Your disgusting infatuation!"

"It's just about that I want to speak to you," Ransom pursued. "As you already know all about it, you have no new shock to receive, and I therefore venture to ask you —"

"Where tickets for her lecture to-night can be obtained? Is it possible she hasn't sent you one?"

"I assure you I didn't come to Boston to hear it," said Ransom, with a sadness which Mrs. Luna evidently regarded as a refinement of outrage. "What I should like to ascertain is where Miss Tarrant may be found at the present moment."

"And do you think that's a delicate inquiry to make of *me*?"

"I don't see why it shouldn't be, but I know you don't think it is, and that is why, as I say, I mention the matter to you only because I can imagine absolutely no one else who is in a position to assist me. I have been to the house of Miss Tarrant's parents, in Cambridge, but it is closed and empty, destitute of any sign of life. I went there first, on arriving this morning, and rang at this door only when my journey to Monadnoc Place had proved fruitless. Your sister's servant told me that Miss Tarrant was not staying here, but she added that Mrs. Luna was. No doubt you won't be pleased at having been spoken of as a sort of equivalent; and I didn't say to myself—or to the servant—that you would do as well; I only reflected that I could at least try you. I didn't even ask for Miss Chancellor, as I am sure she would give me no information whatever."

Mrs. Luna listened to this candid account of the young man's proceedings with her head turned a little over her shoulder at him, and her eyes fixed as unsympathetically as possible upon his own. "What you propose, then, as I understand it," she said in a moment, "is that I should betray my sister to you."

"Worse than that; I propose that you should betray Miss Tarrant herself."

"What do I care about Miss Tarrant? I don't know what you are talking about."

"Haven't you really any idea where she is living? Haven't you seen her here? Are Miss Olive and she not constantly together?"

Mrs. Luna, at this, turned full round upon him, and, with folded arms and her head tossed back, exclaimed: "Look here, Basil Ransom, I never thought you were a fool, but it strikes me that since we last met you have lost your wits!"

"There is no doubt of that," Ransom answered, smiling.

"Do you mean to tell me you don't know everything about Miss Tarrant that can be known?"

"I have neither seen her nor heard of her for the last ten weeks; Miss Chancellor has hidden her away."

"Hidden her away, with all the walls and fences of Boston flaming to-day with her name?"

"Oh, yes, I have noticed that, and I have no doubt that by waiting till this evening I shall be able to see her. But I don't want to wait till this evening; I want to see her now, and not in public—in private."

"Do you indeed?—how interesting!" cried Mrs. Luna, with rippling laughter. "And pray what do you want to do with her?"

Ransom hesitated a little. "I think I would rather not tell you."

"Your charming frankness, then, has its limits! My poor cousin, you are really too *naïf*. Do you suppose it matters a straw to me?"

Ransom made no answer to this appeal, but after an instant he broke out: "Honestly, Mrs. Luna, can you give me no clew?"

"Lord, what terrible eyes you make, and what terrible words you use! 'Honestly,' quoth he! Do you think I am so fond of the creature that I want to keep her all to myself?"

"I don't know; I don't understand," said Ransom, slowly and softly, but still with his terrible eyes.

"And do you think I understand any better? You are not a very amiable young man," Mrs. Luna went on; "but I really think you have deserved a better fate than to be jilted and thrown over by a girl of that class."

"I haven't been jilted. I like her very much, but she never encouraged me."

At this Mrs. Luna broke again into mocking laughter. "It is very odd that at your age you should be so little a man of the world!"

Ransom made no other answer to this than to remark, thoughtfully and rather absently: "Your sister is really very clever."

"By which you mean, I suppose, that I am not!" Mrs. Luna suddenly changed her tone, and said, with the greatest sweetness and humility: "God knows, I have never pretended to be!"

Ransom looked at her a moment, and guessed the meaning of this altered note. It had suddenly come over her that with her portrait in half the shop-fronts, her advertisement on all the fences, and the great occasion on which she was to reveal herself to the country at large close at hand, Verena had become so conscious of high destinies that her dear friend's Southern kinsman really appeared to her very small game, and she might therefore be regarded as having cast him off. If this was the case, it would perhaps be well for Mrs. Luna still to hold on. Basil's induction was very rapid, but it gave him time to decide that the best thing to say to his interlocutress was: "On what day do you sail for Europe?"

"Perhaps I sha'n't sail at all," Mrs. Luna replied, looking out of the window.

"And in that case—Newton's education?"

"I should try to content myself with a country which has given you yours."

"Don't you want him, then, to be a man of the world?"

"Ah, the world! the world!" she murmured, while she watched, in the deepening dusk, the lights of the town begin to reflect themselves

in the Back Bay. "Has it been such a source of happiness to me that I belong to it?"

"Perhaps, after all, I shall be able to go to Florence!" said Ransom, laughing.

She faced him once more, this time slowly, and declared that she had never known anything so strange as his state of mind — she would be so glad to have an explanation of it. With the opinions he possessed (it was for them she had liked him — she didn't like his character), why on earth should he be running after a little ranting, attitudinizing actress, and in such a frenzy to get hold of her? He might say it was none of her business, and of course she would have no answer to that; therefore she admitted that she asked simply out of intellectual curiosity, and because one always was tormented at the sight of a painful contradiction. With the things she had heard him say about his convictions and theories, his view of life, and the great questions of the future, she should have thought he would find such frantic drivel as Miss Tarrant's absolutely nauseous. Were not her views the same as Olive's, and hadn't Olive and he signally failed to hit it off together? Mrs. Luna only asked because she was really quite puzzled. "Don't you know that some minds, when they see a mystery, can't rest till they clear it up?"

"You can't be more puzzled than I am," said Ransom. "Apparently the explanation is to be found in a sort of reversal of the formula you were so good, just now, as to apply to me. You like my opinions, but you entertain a different sentiment for my character. I deplore Miss Tarrant's opinions, but her character — well, her character pleases me."

Mrs. Luna stared, as if she were waiting, the explanation surely not being complete. "But as much as that?" she inquired.

"As much as what?" said Ransom, smiling. Then he added: "Your sister has beaten me."

"I thought she had beaten some one of late; she has seemed so gay and happy. I didn't suppose it was *all* because I was going away."

"Has she seemed very gay?" Ransom inquired with a sinking of the heart. He wore such a long face, as he asked this question, that Mrs. Luna was again moved to audible mirth, after which she explained:

"Of course I mean gay for her. Everything is relative. With her impatience for this lecture of her friend's to-night, she's in an unspeakable state! She can't sit still for three minutes, she goes out fifteen times a day, and there has been enough arranging, and interviewing, and discussing, and telegraphing, and advertising, enough wire-pulling and rushing about, to put an army in the field.

What is it they are always doing to the armies in Europe? — mobilizing them? Well, Verena has been mobilized, and this has been headquarters."

"And shall you go to the Music Hall to-night?"

"For what do you take me? I have no desire to be shrieked at for an hour."

"No doubt, no doubt, Miss Olive must be in a state," Ransom went on, rather absently. Then he said, with abruptness, in a different tone: "If this house has been, as you say, headquarters, how comes it you haven't seen her?"

"Seen Olive? I have seen nothing else!"

"I mean Miss Tarrant. She must be somewhere — in the place — if she's to speak to-night."

"Should you like me to go out and look for her? *Il ne manquerait plus que cela!*" cried Mrs. Luna. "What's the matter with you, Basil Ransom, and what are you after?" she demanded, with considerable sharpness. She had tried haughtiness and she had tried humility, but they brought her equally face to face with a competitor whom she couldn't take seriously, yet who was none the less objectionable for that.

I know not whether Ransom would have attempted to answer her question had an obstacle not presented itself; at any rate, at the moment she spoke the curtain in the doorway was pushed aside, and a visitor crossed the threshold. "Mercy! how provoking!" Mrs. Luna exclaimed, audibly enough; and without moving from her place she bent an uncharitable eye upon the invader, a gentleman whom Ransom had the sense of having met before. He was a young man with a fresh face and abundant locks, prematurely white; he stood smiling at Mrs. Luna, quite undaunted by the absence of any demonstration in his favor. She looked as if she didn't know him, while Ransom prepared to depart, leaving them to settle it together.

"I'm afraid you don't remember me, though I have seen you before," said the young man, very amiably. "I was here a week ago, and Miss Chancellor presented me to you."

"Oh yes; she's not at home now," Mrs. Luna returned, vaguely.

"So I was told — but I didn't let that prevent me." And the young man included Basil Ransom in the smile with which he made himself more welcome than Mrs. Luna appeared disposed to make him, and by which he seemed to call attention to his superiority. "There is a matter on which I want very much to obtain some information, and I have no doubt you will be so good as to give it to me."

"It comes back to me — you have something to do with the newspapers," said Mrs. Luna; and Ransom too, by this time, had placed the young man among his reminiscences. He had been at Miss Birdseye's famous party, and Doctor Prance had there described him as a brilliant journalist.

It was quite with the air of such a personage that he accepted Mrs. Luna's definition, and he continued to radiate towards Ransom (as if, in return, he remembered *his* face), while he dropped, confidentially, the word that expressed everything — "'The Vesper,' don't you know?" Then he went on: "Now, Mrs. Luna, I don't care, I'm not going to let you off! We want the last news about Miss Verena, and it has got to come out of this house."

"O murder!" Ransom muttered beneath his breath, taking up his hat.

"Miss Chancellor has hidden her away; I have been scouring the city in search of her, and her own father hasn't seen her for a week. We have got his ideas; they are very easy to get, but that isn't what we want."

"And what do you want?" Ransom was now impelled to inquire, as Mr. Pardon (even the name at present came back to him) appeared sufficiently to have introduced himself.

"We want to know how she feels about to-night; what report she makes of her nerves, her anticipations; how she looked, what she had on, up to six o'clock. Gracious! if I could see her I should know what I wanted, and so would she, I guess!" Mr. Pardon exclaimed. "You must know something, Mrs. Luna; it isn't natural you shouldn't. I won't inquire any further where she is, because that might seem a little pushing, if she does wish to withdraw herself — though I am bound to say I think she makes a mistake; we could work up those last hours for her! But can't you tell me any little personal items — the sort of thing the people like? What is she going to have for supper? or is she going to speak — a — without previous nourishment?"

"Really, sir, I don't know, and I don't in the least care; I have nothing to do with the business!" Mrs. Luna cried, angrily.

The reporter stared; then, eagerly, "You have nothing to do with it — you take an unfavorable view, you protest?" And he was already, feeling in a side-pocket for his notebook.

"Mercy on us! are you going to put *that* in the paper?" Mrs. Luna exclaimed; and in spite of the sense, detestable to him, that everything he wished most to avert was fast closing over the girl, Ransom broke into cynical laughter.

"Ah, but do protest, madam; let us at least have that fragment!" Mr. Pardon went on. "A protest from this house would be a charming note. We *must* have it — we've got nothing else! The public are almost as much interested in your sister as they are in Miss Verena; they know to what extent she has backed her; and I should be so delighted (I see the heading, from here, so attractive!) just to take down 'What Miss Chancellor's Family Think about It!'"

Mrs. Luna sank into the nearest chair with a groan, covering her face with her hands. "Heaven help me, I am glad I am going to Europe!"

"That is another little item — everything counts," said Matthias Pardon, making a rapid entry in his tablets. "May I inquire whether you are going to Europe in consequence of your disapproval of your sister's views?"

Mrs. Luna sprang up again, almost snatching the memoranda out of his hand. "If you have the impertinence to publish a word about me, or to mention my name in print, I will come to your office and make such a scene!"

"Dearest lady, that would be a godsend!" Mr. Pardon cried, enthusiastically; but he put his note-book back into his pocket.

"Have you made an exhaustive search for Miss Tarrant?" Basil Ransom asked of him. Mr. Pardon, at this inquiry, eyed him with a sudden, familiar archness, expressive of the idea of competition; so that Ransom added: "You needn't be afraid, I'm not a reporter."

"I didn't know but what you had come on from New York."

"So I have — but not as the representative of a newspaper."

"Fancy his taking you —" Mrs. Luna murmured, with indignation.

"Well, I have been everywhere I could think of," Mr. Pardon remarked. "Miss Chancellor told me — Mrs. Luna may remember it — that she shouldn't be here at all during the week, and that she preferred not to tell me either where or how she was to spend her time until the momentous evening. Of course I let her know that I should find out if I could, and you may remember," he said to Mrs. Luna, "the conversation we had on the subject. I remarked, candidly, that if they didn't look out they would overdo the secrecy. Doctor Tarrant has felt very low about it. However, I have done what I could with the material at my command, and the 'Vesper' has let the public know that her whereabouts was the biggest mystery of the season. It is difficult to get round the 'Vesper.'"

"I am almost afraid to open my lips in your presence," Mrs. Luna broke in, "but I must say that I think my sister was strangely

communicative. She told you ever so much that I wouldn't have breathed."

"I should like to try you with something you knew!" Matthias Pardon exclaimed, imperturbably. "This isn't a fair trial, because you don't know. Miss Chancellor came round — came round considerably, there's no doubt of that; because a year or two ago she was terribly unapproachable. If I have mollified her, madam, why shouldn't I mollify you? She realizes that I can help her now, and as I ain't rancorous, I am willing to help her all she'll let me. The trouble is, she won't let me enough, yet; it seems as if she couldn't believe it of me. At any rate," he pursued, addressing himself more particularly to Ransom, "half an hour ago, at the Hall, they knew nothing whatever about Miss Tarrant, beyond the fact that about a month ago she came there, with Miss Chancellor, to try her voice, which rang all over the place, like silver, and that Miss Chancellor guaranteed her absolute punctuality to-night."

"Well, that's all that is required," said Ransom, at hazard; and he put out his hand, in farewell, to Mrs. Luna.

"Do you desert me already?" she demanded, giving him a glance which would have embarrassed any spectator but a reporter of the "Vesper."

"I have fifty things to do; you must excuse me." He was nervous, restless, his heart was beating much faster than usual, he couldn't stand still, and he had no compunction whatever about leaving her to get rid, by herself, of Mr. Pardon.

This gentleman continued to mix in the conversation, possibly from the hope that if he should linger either Miss Tarrant or Miss Chancellor would make her appearance. "Every seat in the Hall is sold; the crowd is expected to be immense. When our Boston public *does* take an idea!" Mr. Pardon exclaimed.

Ransom only wanted to get away, and in order to facilitate his release by implying that in such a case he should see her again, he said to Mrs. Luna, rather hypocritically, from the threshold: "You had really better come to-night."

"I am not like the Boston public — I don't take an idea!" she replied.

"Do you mean to say you are not going?" cried Mr. Pardon, with widely-open eyes, slapping his hand again to his pocket. "Don't you regard her as a wonderful genius?"

Mrs. Luna was sorely tried, and the vexation of seeing Ransom slip away from her with his thoughts visibly on Verena, leaving her face to face with the odious newspaper man, whose presence made passionate protest impossible — the annoyance of seeing everything and every one mock at her and fail to compensate her — was such that she lost her head, while rashness leaped to her lips and jerked out the answer — "No, indeed; I think her a vulgar idiot!"

"Ah, madam, I should never permit myself to print that!" Ransom heard Mr. Pardon rejoin, reproachfully, as he dropped the *portière* of the drawing-room.

(To be continued.)

Henry James.

A ROSE OF JOY.

(FOR A BETROTHAL.)

AS when one wears a fragrant rose
Close to the heart, a rose most fair,
And as the day's life onward flows,
Forgets that it is fastened there,

And wonders what delicious charm
Dwells in the air about, and whence
Come the rich wafts of perfume warm
Subtly saluting soul and sense;

And then, remembering what it is,
Bends smiling eyes the flower above,
Adores its beauty and its bliss,
And looks on it with grateful love,

Even so I wear, O friend of mine,
The sweet thought of your happiness,
The knowledge of your joy divine
Is fragrant with a power to bless.

With the day's work preoccupied,
Vaguely, half conscious of delight,
Upborne as on a buoyant tide,
I wonder why life seems so bright.

Then memory speaks, and winter gray,
And age and cares that have no end
Touch me no more. I am to-day
Rich in the wealth that cheers my friend.

Celia Thaxter.

FEATHERED FORMS OF OTHER DAYS.

OF all those great classes into which systematists and biologists have divided existing vertebrate forms, none stand out more sharply defined from all the other divisions than the class *Aves*, or living birds, meaning of course, as I do, birds as we now find them; for we shall see in the sequel that this has not always been the case. Anatomists have long appreciated, from their knowledge of the presence of certain well-known characters of internal structure, the firm foundation upon which this fact rests; it would be entirely foreign to my object or the aims of this article, however, to enumerate, much less discuss, any of these technicalities, though I would invite the reader's attention to one of the minor external characters—one which first impressions might lead us to think important, but which really is a light weight in the minds of taxonomists,—and that is the development in birds, and in birds alone, of feathers. A little later we shall have something to say upon the subject of feathers.

Finding one class, at least, apparently so completely isolated from all other animals, it is hardly to be wondered at that in early days, clouded as they were by popular superstition and the common belief in the immutableness of all living things and the separate creation of species, the old-time naturalists thought and wrote as they did, and passed down to us the classifications in natural history that we find in their works. They did a great deal for us, and we must close our eyes to many of their shortcomings and apparent shortsightedness; for things that seem simple to us now have but in a comparatively short period of time been made so.

Until the time of our favorite Agassiz, or still later on, naturalists worked away in their closets and in the field, firmly believing that species had always been as they then found them; and most certainly, it never occurred to them that birds had not always existed as birds in their present lovely forms.

We must not presume to allow ourselves to think, however, that this long epoch was lived through without a gleam of the knowledge of the true inwardness of things. As early as the middle of the last century, doubts as to the soundness of the then accepted views of nature arose in the mind of the well-beloved naturalist of France, the Comte de Buffon. The illustrious Lamarck followed Buffon in 1801; then came the

published views of Geoffroy Saint-Hilaire in 1828; since which time first an ethnologist, then a biologist, then a botanist, and after them other special workers in the fields of science, added knowledge that in 1859 culminated in the "Origin of Species," by the immortal Darwin. What a flood of light has been cast over ornithology, the ever-favorite subject of all young naturalists, and fascinating to us all, since that time—since 1861, we may say, when Hermann von Meyer described the single feather of his *Archæopteryx lithographica*, which had been found in the lithographic slate of Solenhofen in Bavaria, a geological horizon belonging to the Upper Jurassic.

Two years later England's great anatomist, Professor Owen, gave to the world his celebrated memoir, wherein he accurately describes the fossil remains of a creature in a slab, to which perhaps the feather in the possession of Herr Hermann von Meyer belonged. This valuable relic, now in the British Museum, was thought by everybody who examined it, to belong to a curious bird, and Professor Owen changed its original specific name from *lithographica* to *macrura*, impressed as he was by the long tail of the specimen, the hinder parts of which were the only ones that had been at all well preserved, in the then only example existing in the world.

A dozen or more years rolled by, and the hope of ever finding a second specimen of *Archæopteryx* had nearly died out in the minds of scientific men, when the son of the physician of Pappenheim, Dr. Häberlein, who found the first slab described, discovered the leg-bones of a fossil that he at once believed to be another *Archæopteryx*,—I think from the same Solenhofen slate beds.

The trained hand of Herr Häberlein was accustomed to disengage the rarest of fossil treasures from their matrix, but what delicacy of stroke was needed here! The unerring blow was given, and the two halves of the slab fell asunder—at once proving the correctness of the doctor's suspicions and giving to the world another and almost perfect example of this the rarest of fossils.

Herr Häberlein afterwards cleared nearly the entire skeleton from its matrix, and, after passing through other hands, it was eventually sought for first by Germany, then by the museum at Geneva. A very large sum was at one time given for it, as it passed from one to

ARCHÆOPTERYX LITHOGRAPHICA. (FROM A PHOTOGRAPH, TAKEN FOR "THE CENTURY," OF THE SLAB IN THE BRITISH MUSEUM.)

another, and the hope was entertained that Emperor William would secure the treasure for Germany, but he, like many a crowned head before him, could not appreciate its value. "Ah!" as Professor Carl Vogt exclaims, "if instead of a bird a petrified cannon or gun had been concerned!" It is from Professor Vogt's article in the "Ibis" of October, 1880, that I am enabled to give a drawing of this creature as it lies in the slab. The illustration in the "Ibis," however, is a reduced photograph taken directly from the specimen; so I did not pretend to copy the many delicate little excavations made by the skillful hammer and chisel of Herr Häberlein, though otherwise my drawing is correct, and gives a good idea of the specimen.

Three examples of *Archæopteryx* exist, then,

VOL. XXXI.—35.

or rather had been discovered up to our time: the single feather of Von Meyer; the British Museum specimen, which is the one described by Professor Owen, and which had attained a size about equal to that of our crow; and lastly, the one described by Professor Vogt in the "Ibis." The latter specimen I have since ascertained is now in the Museum at Berlin. It is about one-fifth smaller than the British Museum specimen, being about the size of a ring-dove.

The feature that first attracts the attention both of the layman and of the scientific man, as he views the picture of the fossil remains of this form for the first time, is the extraordinary tail. This remarkable appendage consisted of twenty vertebræ, or joints, each one of which bore a pair of perfect rectrices or

tail-feathers, that were directed outwards and backwards from the sides of every joint. So accurately has the soft paste of the slate in which the specimen was found taken the impression not only of these tail-feathers, but also of those of the outspread wings, that almost the minutest details in structure can be appreciated by the examiner.

The year after Vogt published his article in the "Ibis," Professor Marsh made a care-

(Marsh). This character is decidedly a reptilian one, no living bird having true teeth. On the other hand, Professor Marsh found that its brain-cast pointed evidently in the direction of the brain of birds. This author further tells us, after an examination of the arm, that "the main interest centers in the manus and its free metacarpals. In form and position these three bones are just what may be seen in some young birds of to-day. This is an important point, as it has been claimed that the hand of the *Archæopteryx* is not at all avian, but reptilian. The bones of the reptile are indeed there, but they have already received the stamp of the bird." Vogt tells us that two of the fingers were movable, and that the third was included in the integuments and bore the hand-feathers. There is no questioning the remarkable fact that the arm supported true feathers,—all the specimens prove this; and, moreover, these feathers constituted well-formed wings, rounded like those of a fowl. Its feet, on the other hand, were formed exactly like the typical feet of any of our ordinary living birds; take a sparrow-hawk for example. Not only this, but the thighs above were covered by a soft down, the impression of which is distinctly seen on the slate; and Professor Vogt seems to think that it may have worn a ruff of this down about its neck, as similar, though faint, markings of the same are found in that region, but we can hardly agree with him in this. No evidences of feathers are to be seen in any other part of the body, and we may safely conclude that its form was otherwise devoid of these appendages and that it was clothed in a smooth reptilian skin.

With such feet, and possessing fully formed wings, *Archæopteryx* undoubtedly led largely an arboreal life, and strange indeed must have been its appearance, with its lizard's body, its wings of a bird, and its long reptilian tail floating behind, lined on either side with its row of perfect feathers, and perhaps withal gorgeously tinted. Reptile it is not, nor is it by any means what is now known as a bird, though a type standing somewhere between the two. Its skin and appendages, its feet and legs, are bird, but the reptiles claim nearly all the rest of its organization; that is, if the line could be sharply drawn in any organization, living or dead. Much have I thought and read of this unique form—this oldest land-bird we have any record of; this go-between among birds and reptiles; this *Archæopteryx*, that became a part of the earth's crust in the mesozoic period. What manner of creatures formed the long line of his predecessors, why did he disappear, and who are his descendants? Such questions can be answered, if it is for men to know them at all, only by

FOSSIL ARCHÆOPTERYX, IN THE BERLIN MUSEUM.
(DRAWING BY R. W. SHUFELDT, AFTER AN ILLUSTRATION IN
THE "IBIS" OF OCTOBER, 1880.)

ful examination of all three specimens of the *Archæopteryx*, and presented us with the results of his labors in a paper, which he read before the British Association for the Advancement of Science at York, September 2, 1881. After reviewing the several important characters brought to light by his investigation, not previously known to us, this author sums up his observations by saying "that we have in *Archæopteryx* a most remarkable form, which, if a bird, as I believe, is certainly the most reptilian of birds."

So much has been written in our time upon the origin and descent of organic forms, that the statement that living birds are descended from reptilian forms does not sound strange. In this highly probable specialization *Archæopteryx* of the Jurassic holds a mid-position. From the studies of Marsh, Vogt, and others, we learn that the skull of this ancient form has proceeded from that of the reptile ancestor, far birdwards. It had teeth in grooves similar to those of *Hesperornis*, a bird we shall introduce further on. These teeth were found in the upper jaw, but they probably also occurred in the lower jaw

patient study of Nature, and all that she offers us. In examination of my restoration of *Archæopteryx* I trust the reader will find that I have paid due attention to all those details of external structure that go to make up our present knowledge of this ancient bird. The head is in a stage of avi-reptilian transition; the teeth are in the jaws, and the setting of the eye is that of a lizard; the body is naked, for had there been feathers the delicate bed of its matrix would certainly have taken their impression, as it did that of the down on the legs; the tail, consisting of joints that undoubtedly had more or less movement one upon the other, is drawn with its double row of tail-feathers; and so on for all the other characters given us by the most prominent writers upon this subject. When Dr. Coues first saw my restoration, he proclaimed it, in his usual kindly way, "a very warm reach of the imagination"; and I am well aware of the audacity of the step, but I still trust that my *Archæopteryx*, considering all the pains bestowed upon it, conveys a fair idea of the form of this ancient ancestor of our birds.

From *Archæopteryx* we pass once more to the generous slates of Solenhofen, to find one more unique and sole existing example of what must have been a lizard-like bird, or perhaps, speaking more strictly in this case, a bird-like lizard; this is *Compsognathus*. This form is often alluded to throughout the literature that has to do with early extinct bird-like animals. The writer has never had the opportunity to examine this specimen; but Professor Huxley tells us that "it has a light, bird-like head (provided with numerous teeth), a very long neck, small anterior limbs, and very long posterior limbs." Now all through the mesozoic rocks, the strata of Triassic age, the Jurassic into the cretaceous beds, we find in different parts of the globe many, many forms that have now been arranged into groups, that show in their skeletons every imaginable shade in point of structure and distinctive character between reptile and bird. Some were of large size; others of mastodontic proportions; yet others were small; undoubtedly some were covered with feathers in their different stages of development; some had their beaks sheathed in horn, while their bodies were stamped with all the characters of the reptile; others had teeth;

RESTORATION OF ARCHÆOPTERYX. BY R. W. SHUFELDT.

a few could fly; some lived on the land, some in the sea, while others were amphibious.

Is it a wonder, then, that we find such a masterpiece in classification as Professor Huxley has given us in the past few years? This profound zoölogist and philosopher swept away all our old landmarks, that for years had held a cordon about the class birds, and allowed them to take their proper place in the grand scheme of nature. This was effected by making one province, the *Sauropsida*, which is divided into the two classes, reptiles and birds; then these diversified forms gradually dropped into their proper orders and genera.

Leaving the Jurassic formation, wherein

we find birds to be the rarest of all fossil remains, we pass into the superimposed strata of the mesozoic formation, the cretaceous beds. Here the geologist and palæontologist have been more amply rewarded for their labors—though birds still remain exceedingly rare in this horizon. In England the cretaceous epoch has thus far yielded only a few scattered remains,—among others, a bird that seemed to bear some resemblance to a penguin, while other skeletons are far too imperfect for us to learn anything very definite from them. In our country, from all that I can gather at the present writing, no remains of birds have yet been detected in the Jurassic, but forms of the highest interest and value have been taken from the cretaceous beds of New Jersey, Kansas, and Colorado, chiefly by Professor Marsh of Yale College, who has given us in his magnificent work, the “*Odontornithes*,” elaborate and exhaustive descriptions of these birds. A large collection of these remains is now in the museum of Yale College, the first specimen having been taken by Professor Marsh in western Kansas during the winter of 1870. The American Jurassic fossil bird, which forms the exception just alluded to, is the *Laopteryx priscus*. It, too, was taken by Marsh, from the Jurassic beds of Wyoming, and so far as its discoverer has been able to inform us, its organization is about equally divided between *Aves* and *Reptilia*.

From the researches of this eminent palæontologist, we learn that his *Odontornithes*, or birds with teeth, formed two very distinct types, widely separated from each other, though both living in the cretaceous epoch of this region. One of these groups contained, as far as we now know, small birds that were powerful fliers, with their teeth arranged in sockets, and having the joints of the spine biconcave, like fishes and many reptiles, differing in this particular from any existing bird. The remaining group contained wingless swimming birds of large size, with their teeth in grooves, and has yielded the most perfect skeleton, upon which the genus *Hesperornis* has been constructed. On page 356 we have a representation of the skeleton of this bird, carefully reduced by the author of the “*Odontornithes*” from his large plate. In all, Professor Marsh has described from the cretaceous beds twenty species of birds, representing nine genera. In some of these the remains are very fragmentary, so much so that it would be impossible to guess, with any degree of certainty, as to their form or affinity; and in any event it would be impossible for me to attempt to de-

scribe them all here, or endeavor to say what their probable habits and forms were. So from them all I will choose but one example, *Hesperornis regalis*, the bird I have just mentioned. Moreover, this bird has the double advantage of being the next but one in point of age to the *Archæopteryx*, and the most perfect remains of it have been found. The oldest fossil bird we have as yet found in America is *Laopteryx*, discovered and described by

RESTORATION OF THE SKELETON OF HESPERORNIS REGALIS.
(AFTER PROFESSOR MARSH.)

Professor Marsh. This bird is alluded to in “Birds with Teeth,” an article not then published, which I was permitted to examine through the kindness of the author.

In Plate 20 of Professor Marsh’s “*Odontornithes*” we find a beautifully restored skeleton of *Hesperornis*, reduced to half its natural size. From measurements obtained from this, we ascertain that this strange extinct bird often attained a height of three feet or more. With this unsurpassed drawing, and aided by Professor Marsh’s own description as to what the probable appearance and habits of *Hesperornis* were, I have ventured upon a restoration of this ancient form (page 357). It is here represented in a position the bird must have often assumed,—a semi-erect attitude, with the body bent forward at an angle half-way between the horizontal and erect posture. He is seen to be resting for a moment after his exertions in his native element, for he was essentially a marine fowl, and is found with other fossil marine animals.

The behavior of this fish-eating *Hesperornis* in the water must have been very much like that of some of our larger and living divers, such as the loon, or perhaps the cormorant, to which group of birds its general form was doubtless not dissimilar; and such a contour has been bestowed upon it in my restoration. Being a capital diver and swimmer, its feet were placed far behind like those of the grebes or loons. Totally incapable of flight, its wings being only in a rudimentary stage of develop-

This author tells us that "the surrounding circumstances were evidently very favorable to *Hesperornis* for a long period. There was apparently during this time an absence of enemies in the air above, and an abundance of food in the water. *Hesperornis* was more than a match for the gigantic toothless *Pterodactyles*, which hovered over the waters here in such great numbers, and the other inhabitants of the air all appear to have been small. The ocean in which *Hesperornis* swam teemed with fishes of many kinds, and thus a great variety of food was at hand, and was obtained with little effort. In this aquatic paradise *Hesperornis* flourished, disturbed only by the serpentine *Mosasaur*, which, even without tradition, we may

ment, on the land, where it resorted for the purposes of incubation, it had no doubt much the action of the penguins, waddling about in a more or less erect attitude. In the time when it lived, the tops of the Rocky Mountains were but islands in the midst of a shallow tropical sea; here it was associated, among other extinct birds, with two of its near cousins, bearing the same generic name, one being larger and one smaller than our subject. Doubtless they all inherited their reptilian character of toothed jaws, and were all active and unrivaled fishermen.

In my restoration, *Hesperornis* has been clothed as my mind sees him and a study of his remains suggests. From beak to shoulder he wears a smooth skin, that perhaps was covered with the very finest of down, too fine to be seen in his portrait; this gradually became thicker and more evident, until it covered his body with a soft rudimentary growth of feathers, of a closer texture than the boots of *Archaeopteryx*. We must agree with Professor Marsh's most probable suggestion that *Hesperornis* bore a tail of straight feathers rather than a naked reptilian one—though, could it be positively known, a realization of this latter idea should not surprise us.

RESTORATION OF *HESPERORNIS REGALIS*. BY R. W. SHUFELDT.

imagine, caused its banishment, if not its destruction."

Before taking our leave of these cretaceous beds of the eastern slopes of the Rocky Mountains, we must at least give a passing notice to the most prominent contemporary of our *Hesperornis*, if no more than mention his name. This was a smaller bird, to which Professor Marsh has given the name of *Ichthyornis victor* (see page 358). *Ichthyornis* has been likened to our terns, gull-like birds that are found inhabiting our marshes or long lines of sea-shore during the most of the year. He was an active fisherman too, and highly endowed with the power of flight. His fragmentary remains prove him to have been a bird that was decidedly reptilian in his skull and still lower type of backbone;

the teeth were actually placed in sockets, and were reproduced just as they are now among the crocodiles. In the remainder of his organization he was preëminently like our modern birds, having perfectly formed wings and other structures of the class well specialized.

The eocene period of England and other parts of Europe, as well as the same geological horizon in our own country, through the many extensive explorations of so able an investigator as Professor Cope, has furnished a large number of birds. A region known as the Paris Basin yielded many others, some of which the illustrious Baron Cuvier described with greater or less exactness. Birds become still more numerous in the miocene, pliocene, and post-pliocene beds; and caves in various localities have afforded many remains of great interest belonging to this class.

Many of the forms, however, from these more recent formations are more or less closely allied to existing birds, and, as they have not as yet been carefully worked up, we will pass these groups by here, without further remark. What has been said must not be understood to apply to the exhaustive work bestowed upon many of these relics recovered from the Paris Basin by M. Alphonse Milne-Edwards.

Two of the three great orders into which birds are now divided are called the *Ratitæ* and the *Carinatae*. The principal feature upon which this classification is grounded refers to the fact that the sternum or breast-bone of the *Ratitæ* is devoid of a keel, the reverse being the case in the *Carinatae*. By far the greater number, and at the same time the most highly organized of our birds, belong to the latter order, the *Carinatae*.

Now we all know something of the strange *Apteryx*, familiar to us as the Kiwi-kiwi in so many works of travel. These birds are still to be found in New Zealand, and belong to this great order of the *Ratitæ*, or keelless birds; they are, too, like all the other members of this order, devoid of the power of flight. *Hesperornis* was a ratite bird, while on the other hand the more specialized (in that respect) *Ichthyornis victor* was a carinate bird. The breast-bones of reptiles are devoid of a keel. All of the remaining groups that make up the *Ratitæ* order are ostriches, or ostrich-like birds—living representatives of which are still to be found in the South American

pampas, in Africa and Arabia, and in the casowaries of the East Indies and Australia, the emeu being confined to the latter continent.

These ostrich-like birds figure very prominently among the extinct feathered forms in a great many parts of the world; ostriches were at one time inhabitants of this country, and Professor Cope has described one of enormous dimensions from the eocene of Texas and New Mexico. The remains of an ostrich have been found in the tertiary of the lower ranges of the Himalaya mountains. But to seek the great center of the region where the remains of this class of birds were and still are found, we must turn our attention to New Zealand and the young continent, the great island of Madagascar.

The two chief extinct genera of New Zealand are *Dinornis* and *Palapteryx*. They were known as moas, because it was believed that they were contemporary with the Maoris, the early natives of these islands.

A very good type of these ostrich birds is the genus just referred to, *Palapteryx*, and this form has been chosen for illustration in the engraving. Assistance was afforded me in reproducing this figure by the cut in Professor

RESTORATION OF THE SKELETON OF *ICHTHYORNIS VICTOR*.
(AFTER PROFESSOR MARSH.)

Sanborn Tenney's Zoölogy, who in turn has it after Professor Hochstetter's restoration. The king of all the moas, a ponderous ostrich-bird, likewise numbered among the extinct forms of New Zealand, was *Dinornis giganteus*. Against this formidable bird-giant the primitive natives waged constant warfare, and an old legend is still going the rounds of popular compilations in natural history of how a traveler was shown the very spot where the last moa was killed, after a frightful conflict, in which the natives lost several of their number. This giant attained a height of ten feet, and others say still more. That the last moa has perished there can now hardly be a reasonable doubt; but as to what manner of men surrounded this feathered monarch in his last struggle much doubt exists, and it probably will always remain a mooted question. Perhaps he fell not by the hand of man at all, for the same formation that held the remains of this *Dinornis* also contains the relics of a bird of prey, the *Harpagornis*, that when it lived was of sufficient size to make the heaviest of all the moas its quarry. It is a suggestive thing to think upon, this death of the last of its race. This thought was forcibly brought to my mind after the death of an old buffalo bull that had wandered away many a mile from the herd, in the treeless plains of Wyoming. Mortally wounded, and surrounded by a party of Indians, with whom I was, he made by no means a despicable struggle for his life. The thought came to me through all that long day, What if he were the last of his race! How and where died the last mastodon, and who will see the last elephant as his ponderous form falls, or the last of the giraffes, when his eighteen feet or more comes to earth, if that is to be the style of his death? Whence the assailants, and what may the fashion of their weapons be?

Such birds as the moas have long since been extinct in the island of Madagascar, but there was a time when there was reckoned among its ancient fauna a bird allied to the moas, that even towered above *Dinornis*, and must have been from twelve to fourteen feet in height. The sub-fossil egg that has been found of this huge creature has a capacity of one hundred and fifty hens' eggs. It has received the name of *Aepyornis maximus*, and its remains so far have yielded to us only a few fragmentary bones; one of these, the leg-bone, is fully a yard in length.

Some five or six authoritative works in my library tell us that this is the bird that is probably alluded to as the roc in the "Arabian Nights' Entertainments." But I must confess that, with the exception of the sole characteristic that both birds were of immense

size, the relationship does not strike me. Perhaps others may be more fortunate in knowing the origin of this statement. The giant ostrich of Madagascar was a flightless bird, and no doubt inhabited the more open plains and level parts of the country, while every allusion that comes to my mind in the "Arabian Nights" to the roc gives it just the opposite habits, being a bird of powerful flight, very prone to seize objects in its talons, and living in the highest of mountains. We find the roc spoken of in the story of Aladdin, where the magician's brother, disguised as Fatima, holds the conversation with Aladdin's wife, the princess, who is made to ask during the course of the dialogue:

"My good mother, what kind of a bird is a roc, and where could the egg of one be found?"

"Princess," answered the feigned Fatima, "the roc is a bird of prodigious size, which inhabits the summit of Mount Caucasus, and the architect who designed your palace can procure you one."

In the second voyage of Sindbad the Sailor it is spoken of again, and a representation of it given in a figure, which looks more like a great vulture than any other bird with which the writer is acquainted. Here are mentioned the immense flights it was in the habit of taking, and that it made serpents of the most fabulous dimensions its prey. Sindbad has another adventure with rocs in his fifth voyage, where a pair of them are made to drop enormous rocks, which they carried in their talons, on the ship in which he is sailing with other merchants, in retaliation for their having destroyed their egg ashore, which was just at the point of bringing forth young.

We now come to the consideration of those birds that have disappeared from the earth within comparatively recent times—all of our foregoing history being confined to birds known to us only as fossils, or, as in the case of the ostriches, in a sub-fossil condition. Of all the birds extirpated within the last few centuries, none can claim an equal share of interest with the famous dodo, once the inhabitant of the island of Mauritius; and notwithstanding the fact that quite an extensive literature, several large portraits, and one or two exhaustive monographs are in existence elucidating all we are permitted to know of this bird, still this paper would be incomplete, were we to pass by without an allusion to the dodo.

We will do more than that for him; we will gather together, from books and elsewhere, all of the old grotesque and almost ridiculous pictures we possess of him, and endeavor to introduce him in a more life-like attitude (see page 360).

THE PALAPTERYX.
(FROM A DRAWING BY R. W. SHUFELDT.)

Upon the only skull of this bird that was at one time known in Europe, the astute Danish naturalist, Professor Reinhardt, clearly showed the dodo's relation to the great family of pigeons; and although this investigator's decision was made upon such meager material, the discovery of many additional remains since has been upon careful examination unable to shake it. The dodo was a bird about the size of a large swan, blackish-gray in color, and flightless, having only rudimentary wings and tail; but his most distinctive external characteristic was a beautiful collection of white plumes, that grew, as we see them in the engraving, in a bunch over the rump. From all accounts the dodo laid only a single egg, and never constructed a nest, simply depositing its treasure in some grassy spot

in the forest or other convenient locality.

These birds were by no means uncommon on the island of Mauritius and the off-lying one of Bourbon when the seafaring Mascarenhas brought his Portuguese explorers to the former in 1598; but in less than a century's time the fate of the dodo was sealed, and the last living one disappeared in that short period before the merciless advance of man, his domesticated animals, and all that follow in his train. It would be difficult to conceive of a being whose surrounding circumstances, added to its own feeble resources of defense, were better combined to insure its certain extirpation: living on an island, which it was unable to leave by resorting to flight or by swimming in the sea; conspicuous by its size; fairly good food; and awkward and stupid, for its very name is derived from a Portuguese one meaning a simpleton. The Mascarene Islands had never been the home of man until the period above mentioned, and we may safely assert that no such form would have developed as his contemporary. We shall see what the fate of the gare-fowl, or great auk, has been under somewhat similar conditions, farther on; but in that case the bird had the great ad-

vantage of being perfectly at home in the water, and so able to go to many unfrequented spots, and often thereby escape death.

THE DODO. (FROM A DRAWING BY R. W. SHUFELDT.)

The island of Mauritius was rather noted for its flightless birds, largely due, no doubt, to the fact that so few disturbing elements were present to molest them, as man and such of the mammalia as prey upon birds. It followed as a natural sequence, then, that those birds, whose native instincts rather inclined them to seek the ground as the more frequent place of resort, having on that island comparatively little use for their wings, if they really originally possessed them, these members in time gradually atrophied and became rudimentary. So, as we might be led to expect, as a consequence the dodo was not the only victim in these islands, of his kind, that succumbed to civilization's onward march; nor are we disappointed in our conjecture, for not only its little sister isle of Bourbon, but the more remote island of Rodriguez, lying off far to the eastward, have both afforded remains of birds that are now extinct, and very remarkable and interesting forms they were too.

When the writer some two years ago was engaged in rearranging the material that went to make up the section of avian osteology at the Smithsonian Institution, he had the good fortune to find, in addition to such treasures as some of the material Darwin had used in demonstrating some anatomical facts in one of his great works, and some fossils from Professor Alphonse Milne-Edwards, from the Paris Basin, a fairly well-preserved lot of remains of the now extinct *solitaire*. This was one of the members of the Rodriguez *avifauna*, and the only good account we have in our possession of him is by the Huguenot exile, Monsieur Leguat, who spent two years on that island towards the close of the seventeenth century. The *solitaire* was a taller, trimmer, though heavier bird than its more rotund and related ally, the dodo of Mauritius. Leguat's account is said to be a very accurate one, and delightful reading, but his figure of the bird that accompanies it is a woful attempt at art, and grotesque in the extreme.

Several species of parrots, doves, an owl, a peculiar starling, all among the land-birds, and several interesting water-birds have now completely vanished from one or the other of this group of islands. Their *avifaunæ* have indeed suffered since man made his appearance among them, and the forces of civilization have been brought into play.

Before bidding final adieu to the Mascarenes and the shades of their departed bird-life, we

THE GIANT RAIL OF MAURITIUS.
(FROM A DRAWING BY R. W. SHUFELDT.)

must introduce the "giant" (*Leguatia gigantea*) of Mauritius. This great rail-like bird was more than six feet high, and no doubt was found on the island about the same time as the dodo. With these extraordinary forms was associated another wingless bird, allied

to the rails, that disappeared from the isle of Bourbon towards the close of the seventeenth century. It is said of it that it ran with surprising swiftness.

As the instincts, feelings, and aspirations of all true naturalists have in all probability suffered no change since the days, two centuries ago, when the hardy Portuguese and Dutch explorers first put foot on these solitary islands, what must have been the sensations of the artists and naturalists that sailed with them — for we are told that such were along — when they were first confronted with such shapes? They met no men in this tropical Mauritius, as did Columbus, a century before, on the beach of San Salvador; but to the lovers of the great unknown in nature a far more diversified picture was presented here, and only such a one as the tropics can give us. On the forest's edge may have been seen a group of ponderous and clumsy dodos; there, stalking along by the marsh-land below, making tremendous pace, great, slim-proportioned rails, six feet in height; these wonders and others in a setting of the grandest of landscapes.

The last thirty years has seen two birds disappear from our own American fauna; and our naturalists will tell you that this gap has been made by the extirpation of the great auk (*Alca impennis*) and the duck of Labrador, or the pied duck, as Audubon gave him to us. The disappearance of the former had long been predicted, but the doom of the latter had never been anticipated. The great auk, or the gare-fowl as it is more commonly called in Europe, has with us still several, though much smaller, existing relatives; these latter, however, have the power of flight, which the gare-fowl did not. It was owing to this circumstance that their extinct relation came by the name of penguin — a bird they, upon casual inspection, closely resembled, and whose habits were not at all dissimilar; in fact, the great auk filled the penguin's place on the Newfoundland and Labrador coasts. The chief factor in the extinction of this water-fowl was the fishermen who visited its otherwise secluded resorts. These people killed them in large numbers, and the young, we are informed, were used for bait.

From his own statements in his unrivaled work, it seems that Audubon never saw, even in his day, a specimen of this bird on our coast, and this author tells us that "the only authentic account of the occurrence of this bird on our coast that I possess was obtained from Mr. Henry Havell, brother of my engraver, who, when on his passage from New York to England, hooked a great auk on the banks of Newfoundland, in extremely

boisterous weather. On being hauled on board it was left at liberty on the deck. It walked very awkwardly, often tumbling over, bit every one within reach of its powerful bill, and refused food of all kinds. After continuing several days on board it was restored to its proper element."

Great auks were captured either in Iceland or some of the off-lying islands of the continent, including Great Britain and Ireland, as late as the year 1844; and our friends across the water have been far more fortunate in the number of specimens and other relics than we have. In this country I know of but three examples in museums, while abroad some seventy specimens have been preserved, and sufficient other material to have enabled Sir Richard Owen to give us one of his magnificent royal quartos treating of its osteology.

The pied duck was never dreamt of as being on the road towards extinction even in the very latter days of Audubon's writing, and its disappearance was quite sudden. This duck never was known to carry its migrations far inland, but was confined along the Atlantic coast to Labrador and northward, rarely being seen south of New Jersey. It bred off the mouth of the St. Lawrence, on the rocky islets, and English ornithologists say not much north of this, citing this as one of the causes of its extermination, for persons visiting these resorts for its eggs killed large numbers of the ducks besides. There were no other evident causes why such a bird should become so suddenly extinct, for it was a strong flier, not brilliantly plumaged, nor particularly sought after for its flesh. A specimen of the pied duck was killed in Halifax harbor in the year 1852; but even at that time no foreboding had been expressed by ornithologists as to its probable early extinction. Quite recently two hundred dollars was offered in England for a well-preserved pair of these birds.

Audubon drew the beautiful pair of these birds, in the plate in his princely work, from two he had received from the "Honorable Daniel Webster of Boston, who killed them himself on the Vineyard Islands, on the coast of Massachusetts."

The pied duck was a few inches smaller than the common Arctic eider, to which it was nearly related. There are good specimens of it in the Smithsonian Institution, but so rapid and unexpected was its departure that the writer is unable to say how well the museums abroad are favored in this respect.

We learn that a bird quite recently has been eliminated from the fauna of Philip Island in the South Pacific; this time it is a parrot,

known during its life period to naturalists as the long-billed parrot (*Nestor productus*), standing between the true parrots and the cockatoos. The causes of its destruction are unknown to me.

And thus we see how it is: different species of birds are being eliminated in all parts of the earth, just as their predecessors were during the various geological epochs, and this elimination is constantly and unceasingly at work. The island that we now call England, Scotland, and Wales once reckoned among her avifauna ostrich-like birds of no small size; and as ages have rolled over her head, and all manner of forces have been acting and reacting, that have slowly changed the surroundings of her fauna, we find many of her types disappearing, while others have become more prevalent. In more recent times gamekeepers and legislation are two elements that have been at work, and taken no small share in some of these changes, as instances of which we find that certain game birds and birds of prey have been completely extirpated in Great Britain. Who has a doubt in this country what the fate of our wild turkey is to be? In more remote times it was physical causes among others that acted to destroy certain types of birds, though, as they gradually acquired their power of flight through the development of wings, they must have been more fortunate in this regard than other animals, as by this means they could often escape the great convulsions that took place in nature, such as fire, floods, landslides, and the like, which certainly entombed

other creatures or utterly destroyed them. The power of flight, however, did not exempt birds from that still more important force, so incessantly at work, the mutual reaction of one organism upon another, which through all time has operated to the improvement of some, and beyond all doubt to the extinction of many a form of exquisite beauty.

In the United States to-day, the birds that make up our fauna, so far as we now know them, number nearly nine hundred species. Many of these species have their millions of representatives, and an instant's thought will afford an idea of how immense the entire host must be; and yet let me ask you, inveterate rambler, how often do you find the body of a dead bird in your path? The writer has been a collector and observer of birds from Mexico to the peaks of the Rockies for about twenty years, and can cite but comparatively few instances, a number so small that, if compared with the living, need not be taken into consideration at all, or, as they say in mathematics, it would be an unassignable quantity. Yet from all causes millions of birds do die every year, and when they die what becomes of them? Eliminating those that perish as objects of prey, we find that such birds as are blown into sheets of fresh water, by storm

THE PIED DUCK. (DRAWN BY R. W. SHUFELDT, AFTER SPECIMENS IN THE SMITHSONIAN INSTITUTION AND THE AUDUBON PLATE.)

THE GREAT AUK (*ALCA IMPENNIS*).

or otherwise, and are drowned, invariably float on the surface, owing to their exceedingly light skeleton and their feathers. Here they eventually reach the shore-line, where in a very little while their tender bodies macerate, and the bones are scattered far and wide, or some prowling animal makes still quicker work of them. In salt water the preservative qualities of that fluid, no doubt, allow them all to reach the shore-line with greater certainty, but here sun, moisture, and the carnivora of earth, air, and sea soon put them out of sight.

Animals, on the other hand, often sink to the bottom, and, if the place of deposit be in a river, may soon be covered up, after lodgment, by the sediment, and thus be preserved

for ages; but, as we have just seen, this rarely happens with the bodies of birds, which float upon the surface and are dispersed.

As the more modern forms of birds for many ages have not been in the habit of resorting to caverns for any purpose, and have rarely been dragged in by beasts of prey, this fruitful source of preservation of many of the dead mammalia and reptiles need hardly be alluded to in the case of birds. The peat-mosses, wherever they occur in any country, owing to their antiseptic qualities, have preserved many a form for the students of all ages; but these have only allowed the heaviest of birds to sink into them, as the *Mare aux Songes* did the dodo in Mauritius, whereas the lighter

forms would escape any such entombment. So it is that the remains of our feathered forms have been rendered so rare, and comparatively so few examples have been discovered through all these long ages. This absence of aviarian fossils furnishes us with a very good reason why this class has cut such an insignificant figure in the study of the physical history of our earth. Some idea may be formed of the meagerness of this material, from the fact that in this article nearly all the examples known to science, through all time, are mentioned, and my illustrations present figures of all the more important of the feathered forms that are now extinct. If a catalogue of all the extant specimens were printed in ordinary type, the volume that contained the record would be of no very great size; and think of the countless millions of birds or animals with feathers that during these long, long ages have lived and subsequently perished. Regarding the history of our feathered races in the past, read from the fossil records that have come to us, as a history of the class and nothing more, irrespective of anything we may learn of it that bears upon the physical history of our planet, we find that, starting from their present representatives as an isolated and lovely group of animated beings, their most recently extinct forms differ in no essential particular from the living ones; for instance, if the pied duck

could be reproduced, he would not figure in our fauna as an oddity, as the dodo certainly would. As we sink deeper and deeper into this record, we find that the birds differ more and more from the present types; that a greater number of flightless ones are discovered, this disability constituting one of the factors, and an important one, in their extirpation; that as we continue our research in this mutilated record, with its many missing pages, we fall into the cretaceous beds. Ah! what a lapse of time, and how vast the change; we have to refer but to the record of *Hesperornis* to appreciate this — teeth, a questionable covering of feathers, and a keelless sternum. Another leap into the depths of time, when we find the *Archæopteryx*, whose organization must indeed have been a lowly one. It seems, too, the further we go back into geologic times, the less specialized do bird forms become, and the nearer they approach the reptilian types. Although extinct feathered forms can teach us little more, we may be happy in the thought that so immutable is the primeval code of laws, that they have never ceased to operate in the same manner now as they did in the beginning; and as with all beings, so has it been from the reptile of mythical Eden to the snow-white dove of our day, the tendency is ever onward and upward in the line of improvement.

R. W. Shufeldt.

LOVE THAT LIVES.

DEAR face — bright, glinting hair —
 Dear life, whose heart is mine —
 The thought of you is prayer,
 The love of you divine.

In starlight, or in rain;
 In the sunset's shrouded glow;
 Ever, with joy or pain,
 To you my quick thoughts go

Like winds or clouds, that fleet
 Across the hungry space
 Between, and find you, sweet,
 Where life again wins grace.

Now, as in that once young
 Year that so softly drew
 My heart to where it clung,
 I long for, gladden in you.

And when in the silent hours
 I whisper your sacred name,
 Like an altar-fire it showers
 My blood with fragrant flame!

Perished is all that grieves;
 And lo, our old-new joys
 Are gathered as in sheaves,
 Held in love's equipoise.

Ours is the love that lives;
 Its spring-time blossoms blow
 'Mid the fruit that autumn gives;
 And its life outlasts the snow.

George Parsons Lathrop.

POINTER "CROXTETH." (FROM A PICTURE BY J. M. TRACY; BY PERMISSION OF JAMES M. BURT.)

TYPICAL DOGS.—POINTERS.

AS the owner and breeder of pointers and setters for nearly thirty years, with preferences vibrating from time to time from the one to the other, I have finally, I think, reached a settled preference for the pointer. It is a common opinion that the setter is the more affectionate, sagacious, and domestic; but I doubt whether this is borne out by experience. Among the many dogs I have owned, the

most remarkable instances of sagacity and affection which have come under my observation have been in pointers. If space permitted I am sure I could interest readers by narrating the wonderful intelligence of my old pointer "Brack," who was the best ball player in our school, or the life of "Vic," who took her university course with me, and I doubt if any setter that ever lived was their superior.

POINTER "METEOR." (FROM A STUDY BY J. M. TRACY.)

And yet I would not be understood as decrying the setter, for the scale of excellence between the breeds is very nearly evenly balanced, and as I have said is a mere matter of preference. The best dog I have to-day is a young setter named "Diomed," combining the strains of "Coin," "Ranger," and an old stock of Virginia natives; although he is but eighteen months old I do not believe a finer field dog lives.

much of his time was spent in seeking the little lakes to bathe and refresh himself, and relieve the suffering occasioned by his thick coat. Nor is his advantage from this in cold weather considerable. In very cold weather it is apt to be unfit to shoot, and whenever the season is auspicious, however cold, one may rest assured that a pointer, of the energy and dash a good dog should have, will keep himself warm with the exercise. I consider an-

POINTER "BANG BANG." (FROM A PICTURE BY J. M. TRACY; BY PERMISSION FROM THE WESTMINSTER KENNEL CLUB.)

My observation of the two breeds, however, has led me to the conclusion that pointers, as a class, have keener noses, more passion for hunting, and more endurance than setters. Our best shooting is in the warm sunny days about the last of October and until the middle of November. In that season setters with their heavy coats become weary much sooner than the short-haired pointer. I became more convinced of this than ever before this year on the prairies of Minnesota. I shot prairie-chickens with friend Vandevort, who took out a string of splendid pointers, including "Don," "Luck of Eden Hall," "Luck's Baby," "Joy," "Drab," and "Icicle." It was intensely hot on the prairies, and we had a companion with a setter. While the pointers were comparatively fresh the setter was distressed, and

other thing greatly in favor of the pointer. He has the pointing instinct much more distinctly developed in him than the setter, and once broken, he retains it more surely. The setter is of spaniel origin, and like the spaniel his inclination naturally is, on discovering game, to flush, and chase, and even give tongue. This I do not object to. On the contrary, the pup I delight in is one that, instead of halting, and squatting, and pointing, dashes, bulges in, and runs wild when he strikes his first game. His early frenzy is but proof of the consuming passion for sport which insures a good dog. But this inclination, springing from the spaniel instinct to chase and clamor, necessitates in many setters the loss of several of the best days of the season every year in bringing them down to the strict rules of

business, while on the other hand the pointer being by nature inclined to the cataleptic attitude is apt when once broken to retain his breaking for life, and furnish the same sport on the opening day of the season as when we

have become so imbedded in the feet padding and in the long hair under the shoulders and thighs of my setters as to force me to lose half an hour in removing them, at the prettiest hour for shooting, for they so encumber,

POINTER "BOW." (FROM A STUDY BY J. M. TRACY; BY PERMISSION OF MR. J. G. HECKSCHER.)

take our farewell shoot in the cold winds of January.

Many persons extol the superior beauty of the setter. A handsome setter with silken hair and soft lines is very attractive, but a clean-limbed, hard-muscled, round-ribbed pointer is a type of beauty to which thousands of men incline in preference to the other. To my eye nothing expresses beauty more strongly than the hard, clean outline from occiput to tip of tail, from shoulder-blade to arched toe, of a lean, hard pointer whose every line and every muscle tells what he was made for and what he can do. He stands expressing power, and will, and grit, and toil, like a blacksmith leaning on his sledge by the molten fire, and no silken setter can surpass that expression any more than could a gentleman in dress suit surpass the grim blacksmith's look of strength.

A minor advantage of the pointer in our section, and yet one not to be ignored, is the constant trouble of the setter from which the pointer is free, arising from the pestiferous sand-burr. On many occasions these burrs

lame, and distress the setter-dogs as to unfit them for work, while the pointers pass through them unharmed. *Per contra*, few are the pointers that can or will enter our matted brier patches on the ditch banks and drive out the sulking birds or follow the wing-tipped, as do the setters with their heavy coats.

The type of pointer has greatly changed within my memory, and I do not think it has improved. The first pointer I recollect was "Bembo." He was a dog weighing seventy pounds without any lumber. He was liver-shotted all over, with a broad, flat head, deep flews, a red haw in the eye, round-ribbed, high on the leg, ragged and broad in the hips, rat-tailed, with feet as large as one's fist, hard as nails, and ran like a horse on the home stretch. When he stood his jaws dripped foam and his cheeks distended and fell with excitement. When he ran he would knock you down if you were in the way, and when he took a fence he only touched with his heels. "Bembo" was the common type of pointer in those days. The finer breed was

POINTER "DONALD." (FROM A PHOTOGRAPH BY SCHREIBER, PHILADELPHIA.)

represented by the breed of Mr. Joseph Gayles of Washington, but they were nothing like the shivering, curly-tailed, bull-dog-headed, and Italian-greyhound-bodied dogs that are being bred to-day. "Bembo" had more work in him than whole kennels I could name to-day, and his breed is now almost or quite extinct. We are breeding them too fine, and are sacrificing stamina, grit, go, and real field worth, for a false standard of beauty.

Without comparing the relative merits of the celebrated pointer dogs in America, or even attempting to name them in order of merit, the most celebrated I know are Sensation, Faust, Croxteth, Rush, Vandevort's Don, Beaufort, Meteor, Bravo, Donald, Beulah, Bellona, Lalla Rookh. To these I might add many others of both sexes, but forbear, as space forbids. Without wishing to appear invidious, and without having shot over the others, I have no hesitation in saying that while Vandevort's Don is far from being the handsomest pointer I ever shot over he is the best field dog I ever worked behind, and my own old Beulah is, without being a thorough type of beauty, the gentlest, tenderest, most sagacious and affectionate pointer bitch I ever shot over.

John S. Wise.

OUR American pointers for very many years have been more *uniformly* good than our setters, and this is because the pointer is more easily kept to a type. In England, where the greatest care is taken in his breeding, he is truer to type than the setter, and the importations from England of the finest specimens that money could procure, have done much for five years past, and are still doing much, to improve the breed in America. No other dog can compare with him in that finished appearance which characterizes him, yet no dog is capable of doing harder work. A well-bred pointer, and by that I mean a *properly* bred dog, is courageous and enduring. When his day's work is done and he has had his supper, he is ready for bed without groaning; and the next morning finds him fresh for new fields. He is inferior to no dog in all the qualities that go to make the sportsman's companion. Pointers will be bred by intelligent breeders in America in future with a view to field qualities, and this will produce *handsome* dogs. The *best* form for a working pointer is the *handsomest* form. The pointer of the future will weigh from fifty to sixty pounds, the nearer fifty-five the better. He will have a clean-cut, bony head, with plenty of brain room, but without the pronounced occipital

bone standing up sharp, which has been so long admired, but which is neither useful nor ornamental. His head will be set on a clean, race-horse-looking neck, free from unnecessary throatiness, and slightly arched. His shoulders, which must be well muscled and well bent, will lie close to the chest, and be narrow at the top. His legs will be particularly well boned and muscled—but as clean as swords. His feet will be round and hard and tight.

we must discard every animal of unauthenticated pedigree, for the unknown sort *may* be mongrels, and very likely are. We must avoid extremes of size, shape, or other physical characteristics. We must adhere to a proper type, and not expect good pups from poor parents. We must make up our minds to get rid of every animal in breeding, that is not first-rate, recollecting that one good dog is worth fifty poor ones, and cheaper to raise.

POINTER "MAXIM." (FROM A STUDY BY J. M. TRACY; BY PERMISSION OF C. KLACKNER.)

His chest will be deep and full. No broad, thick-chested pointer ever was or ever can be fast and enduring. His back and loin will be strong and sloping back gradually to wide, strong, sloping hips. His thighs will be well bent and well muscled, not beefy. His stifles and hocks well bent; his pasterns clean. His tail straight and gradually tapering to the end, but not too fine and rat-like. His general appearance well balanced and harmonious. No ill-proportioned dog should be tolerated.

If proper judgment is used in breeding; not the simple mating of a sire and dam because both are imported, or because both in their way are fashionable; but that judgment which having selected the proper form of both, looks to the happy crosses of winning blood, we shall produce pointers in America the equals of any in the world. To do this

The Drake, the Bang, and the Sefton crosses are the best blood obtainable from England, and the happiest combinations of these three are the foundation of the future American pointer.

John W. Munson.

OF all the sporting dogs that we have at the present day, the pointer is the oldest pure breed; the many varieties of setters being made up of various crosses. He is spoken of as having been imported into England from Spain some time in the seventeenth century; he also crept into France, Germany, and even Russia. England did more to improve the breed than any of the other countries, so that to-day this strain is spoken of as the English

POINTER "BRAVO." (BY PERMISSION OF MR. J. G. N. APPOLD.)

pointer. The original Spanish pointer was a heavy, slow dog, loose-made and very lumbering. In the early stages of improvement, he was undoubtedly crossed with the fox-hound, and by judicious breeding he has reached his present high standard of excellence. In Germany, he has retained more of his old Spanish type. He was first introduced into America from England, and in fact is even still being imported; but those bred in this country from first-class stock not very far distant from imported parents, are even ahead of what have recently been sent to this country and represented as being considered in England first-class. For all-round field work, the pointer is better than the setter, and when once broken is *always broken*, as he never forgets his training, no matter if a season passes without being used.

At bench-shows the pointers are divided into two classes; the light weights fifty-five pounds and under, and the heavy weights over fifty-five pounds. For general field use the small pointer is much the best, as he can stand more work than the large ones. They are more easily carried around either in a wagon or on railroad trains, and when out of the field are a neater-looking animal for a companion. I never saw a large dog keep up with a medium-sized one; they might do it for a while, but the smaller ones are generally

full of animation up to the finish of a long hunt. From my experience the best dog weighs from fifty to fifty-eight pounds, has a good deep chest, not too long coupled, shoulders sloping, cat feet, and strong hind legs. The hind legs are what gives the animal the propelling power, and the sloping shoulders aid him in his free, easy gallop.

A dog with a broad, bull-dog chest is never a good goer and never can last in his work. If the hind quarters are not good the dog has not the graceful motion that is so pleasing to the eye of a sportsman.

In color, the pointer's coat has less variety than the setter. There are liver and white, lemon and white, solid liver, and solid black. Some are black and white, but it is not often. A pointer's nose and eyes should be in harmony with the color of his spots, that is, a liver and white dog should have a liver-colored nose and eyes of as near the same brown as possible. A lemon and white dog should have a flesh-colored nose and lighter eyes. A lemon and white pointer should *not* have a black nose or black eyes. Having stated the major points of the pointer I will not go further in detail than to call attention to the tail, which should be tapering to a sharp point, straight and carried level with the back or a little higher, but not straight up in the air.

PAINTED BY CAROLUS DURAN.

PORTRAIT. BY PERMISSION OF MRS. BRADLEY MARTIN.

ENGRAVED BY T. JOHNSON.

A FRENCH PAINTER AND HIS PUPILS.

A YOUNG painter of Boston, Mr. Robert C. Hinckley, in the fall of 1872 wished to become a pupil of the well-known Parisian artist, M. Carolus Duran. M. Duran refused, but told him that if he would take a studio he would occasionally come and see his work. The studio was taken, in conjunction with Paul Batifaud-Vaur, Duran visiting them regularly every Tuesday and Friday, and refusing, then as now, all compensation. Others joined the class, new quarters were taken, and in 1873 there were about a dozen students, two-thirds of them American or English, and the rest French. For a time there was a Persian among them. The class has greatly increased in size, at one time nearly half of the fifty members being American. The school at present is at 110 Boulevard du Port Royal. Among the Americans who have been members of the class are Messrs. John S. Sargent, Carroll Beckwith, Will H. Low, Charles Melville Dewey, Theodore Robinson, Kenyon Cox, Frank Fowler, Walter L. Palmer, Ralph Curtis, Stephen Hills Parker, and Alexander Harrison.

M. Duran is as popular as ever among his students, whom he generously continues to favor twice a week with his teaching. Twice each month M. Duran gives to his pupils a subject for a sketch. A day is fixed for the bringing in of the sketches, and, after the regular lesson of the day, the easels are put aside and the sketches, all of the same subject, in charcoal, crayon, or oil, are placed in a good light, on the floor, stools, or easels; the professor takes a seat, lights a cigarette, and the pupils gather around to listen to the criticisms of their works. Often these criticisms lengthen into talks, or, as Monsieur Duran entitles them, "lessons." Some of them have happily been preserved for the outside world by one of the scholars, who has reported them stenographically. A selection of these is presented below.

H.

LESSONS TO MY PUPILS.

First Lesson.

IS PAINTING simply an imitative art? No; it is, above all, an art of expression. There is not one of the great masters of whom this is not true. Even the masters who were most absorbed by outward beauty, being influenced by it according to the sensitiveness of their natures, understood that they neither could nor ought

to reproduce anything but the spirit of nature either in form or color. Thus it happens that these masters have interpreted nature, and not given a literal translation. This interpretation is precisely what makes the personality of each of them. Without this individual point of view there can be no really original work. This shows how dangerous are those schools that, restricting the artists to the same methods, do not permit them to develop their individual feeling. These schools, however, make use of a very respectable motto: "Tradition." But what are we all but the result of tradition? — only we ought to be free to choose in the direction that agrees with our aspirations, and not have imposed upon us those of another man, however great he may be.

In the French school, since Ingres, the tradition comes from Raphael. That was very well for Ingres, who freely chose the master from whom he really descended; but we who have other needs, who desire reality, — less beautiful, without doubt, but more passionate, more living, more intimate, — we should search a guide among the masters who responds most fully to our temperament.

Imagine the painters of the seventeenth century in Spain, Flanders, or Holland obliged to follow in the footsteps of Raphael instead of the inspiration of their individual genius! What would have become of their productions? Instead of Velasquez, Rembrandt, Rubens, Teniers, Ostade, and Brauer, we should have had a lot of would-be Raphaels, counterfeited, stunted, and grotesque, — a commonplace and disheartening plagiarism substituted for their sincerely and extremely varied *chefs-d'œuvre*.

The example that I have just given you in the past has a singular application at present, when the same causes are producing the same disastrous results. It is as absurd to attempt to impose on artists one and the same mold in which all — powerful or weak, impassioned or timid — must form their thought, as it would be to constrain them to modify their physical natures until all should resemble a given model. Art lives only by individual expression. Where would we be if the great masters of all times had only looked to the past — they who not only prepared, but made the future? Works of art can only be produced by the recalling of our aspirations and experiences. To live one's work is the condition, the *sine qua non*, of its power and of its truth.

These principles apply not only to "compositions," but also to the painting of portraits, which many wrongly believe to be another art, because the greater part of portrait painters have only represented the visible form of their subject. If we study the masters that are looked upon as first in this order, we shall see that they have not been contented with the material appearance, but that, putting themselves aside, they have sought the particular characteristics of the model — his mind and his temperament as well as his manner. To place all one's models on the same background is like serving all kinds of fish with the same sauce.

We will review some of those who, right or wrong, have come down to us as types: Holbein, Velasquez, Rembrandt, Titian, Raphael, Van Dyck. Which of these painters best agrees with the ideas I have just expressed? Among the persons painted by Holbein, Velasquez, and Rembrandt, there is not one that does not seem to be known to you intimately. You exclaim, in spite of yourself: "I feel as if I knew him — what a good likeness it must be!" Each has his own individuality apart from the habits and plastic tendencies of the painter. Titian, in spite of his admirable works in this art, is a transition between these first and those less close in their portrayal of the individuality of their subjects. Raphael, in his love for beauty and harmony, only heeded the model posing before him as far as it coincided with his ideal. In all his portraits we see Raphael; but it is impossible to disengage the precise individuality of the person portrayed.* In Van Dyck it is yet more noticeable. He has painted commoners and nobles, giving them all the same style, the same elegance, that sprang from his own taste and graceful personality.

This necessity of self-abnegation, indispensable to the portraitist, is the only thing that separates the portrait from composition. I will leave to Ingres, who did wonders in this direction, and to Delacroix, who really was unable to make a portrait, the task of saying to which of these two *genres* supremacy belongs — if supremacy there be. Ingres said that only the greatest masters had made true portraits. Delacroix wrote, with a sadness that one feels between the lines, that portraiture is the most difficult thing in art. I myself believe that each offers different but equivalent difficulties, the placing on view of one person being as complex as that of ten. In a picture you must draw all from your own soul, — your remembrance of the phenomena of nature and your feeling toward nature, your past joys and griefs.

Second Lesson.

The Flight into Egypt.

THERE are two methods of understanding a subject. It may be treated heroically or intimately. In the latter case the artist enters into the life of the personages that he desires to represent, observing them as human beings; as it were, following them; taking account of their impressions, their joys, and their sufferings. The heroic manner, on the contrary, expresses but an instant of their life, when raised to an exceptional pitch. The personages presented are, as you might say, deified, so much do they seem to be absolved from the daily necessities of humanity. But, for this very reason, they lose many sympathetic charms that we only find in beings living, thinking, and suffering like ourselves. The latter alone can move us, because we find our own experiences in their melancholy, their terrors, their passions.

The heroic method, necessarily restricted, is obliged to impose upon its personages a sort of conventional grandeur that suppresses the better part of their originality.

In the subject that now occupies us, let us take our personages at their starting-point and accompany them through the different episodes that must have marked their precipitate flight. You all know the legend. Joseph is warned in a dream that the time has come to quit Judea with the Virgin Mary and the Divine Child. Picture to yourselves the incidents of this departure. See the group precipitately leaving in the night; follow them hour by hour; imagine the scenes that must have followed one another, at the morning fires, in the glimmering twilight, in the moonlight, or under the bright light of day.

Tiepolo has made, in thought, this journey as I have indicated it to you; he has pictured these episodes; very many of them are most touching and very delicately felt. He has portrayed the solitude of a hamlet during the night; the holy travelers are crossing it hastily, not daring to trust themselves to any hospitality. Then, farther on, they arrive on the banks of a river that must be crossed. Angels push the boat, and, farther on, the Virgin Mary is supported by them as they climb a steep ascent.

You are not to imitate Tiepolo, nor to bear in mind his compositions; but you must proceed like him. It is the only way to avoid the commonplace — the only way to find charmingly intimate scenes; the child Jesus crying, smiling, or being nursed by his mother.

* M. Duran, we think, will not find many to agree with him in so sweeping a condemnation of Raphael's portraits. — EDITOR.

The travelers have rested in the shade, as you might have done; they have had in their flight a crowd of emotions, such as you may have felt in your journeys. Call up your remembrances and apply them, so that the personages may be before your eyes, moving, walking, resting, forming a whole with the nature that surrounds them and of which they reflect the influence.

This sympathy that has made you live in thought with your subjects has shown them to you in varied circumstances, under the numerous effects of light, shade, or twilight. Choose one of these effects—that one of which you have kept the clearest and most vivid remembrance. Your group must harmonize with the hour, solemn or cheerful, that you have chosen. As you are very different from one another, your compositions will reflect the variety of your natures.

This habit of living with your personages will have the effect of presenting them to your mind under a fixed form. Having followed and analyzed all their actions, all their sentiments, you will in the end know them as if they were real beings. It will appear to be the remembrance of an actual scene.

Do not hurry to place this vision on canvas. Turn it over in your mind, that it may be refined and completed at every point of view. It is only when you have thus mentally elaborated your composition, that you should decide to execute it; for then you will have lived it.

Third Lesson.

Subject of Sketch : Circe.

To DECIDE upon their attitudes, to compose the groups, to give variety to all parts of this subject, you would have to make the same reasoning that I recall to you continuously. You must take into account the character of the personages, the actions they have just passed through before the decisive moment that can best be reproduced by painting. It is by this retrospective study of the acts and gestures of your heroes that you will be able to introduce among them that variety without which there is no picturesqueness. The action of each, in harmony with the action preceding it, will give an impression of life. The character of each individual must be preserved, making the scene interesting by the different manifestations of the same sentiment.

Thus, in the subject that occupies us, what were Ulysses's companions doing at the moment that Circe's wand touches them and changes them into swine? They were degrading themselves by the misuse of pleasures, until they had fallen to the level of the brutes.

Those who descend to this level have lost the sign of human dignity; they are touched by the wand; that is to say, they have transformed themselves into swine. Some assumed, laughing coarsely, the bestial mask; others are in a state of dejected stupefaction; others wallow with a sort of fury, seeming to forget already that they have been human and have known how to hold themselves erect. Then, in the midst of this orgy (where only one companion refuses to abdicate his reason), see rising up the complex and mysterious figure of Circe.

Fourth Lesson.

Subject of Sketch : The Birth of Venus.

In the Grecian mythology Venus is the goddess of love. Her birth is the festival of life. The daughter of the inconstant waves brings to the world, of which she is to be the queen, youth, light, the pleasure of the senses, the attraction of the flesh.

So much for the moral personification of the subject; let us now seek the physical side. All are transported at the sight of this beautiful moist body, the long, floating hair, and the juvenile grace. We might say that the inhabitants of the waves had decked themselves in their finest toilets to receive and do her honor. They are intoxicated with delight. Musset has said admirably:

“Regrettez-vous le temps où le ciel sur la terre
Marchait et respirait dans un peuple de dieux;
Où Vénus Astarté, fille de l'onde amère,
Secouait, vierge encor, les larmes de sa mère,
Et fécondait le monde en tordant ses cheveux?”

We have found the temperament of our subject; let us now see its picturesque points. Let us enter into the pagan world as well as our own; give to this divine beauty noisy mirth, a gay uproar of amorous nymphs, of Tritons in shell armor, blonde and dimpled cupids, and birds of variegated plumage. We have not roses enough in our palette to throw at the feet of her who brings love and life to a dazzled and grateful world. Place around Venus everything that loves, for she is the personification of this exquisite and ideal sentiment. Here, then, is the work in your imagination. Let it now become plastic. Call to mind all that has been painted on this subject. You will see how few artists have understood it; how superficial they have been. When Venus appears, she is pure; no one is born unchaste. She is yet ignorant of her empire.

It is not only Venus that must be pictured; it is what she represents, what she makes us experience. It is the festival of youth—Venus in the highest expression of her glory. Your

love, your need of loving, must be questioned. To have a response, touch the most secret strings of your heart. Imagine that love, until now unknown, has come to the world; that inclosed in her quiver are not only sharpened arrows, but also the highest ambitions that ennoble man.

"Ce que l'homme ici bas appelle le génie—
C'est le besoin d'aimer,"

Musset has said. Remember your emotions when you were twenty and loved for the first time.

I would make Venus almost like a Madonna, painting her with a religious sentiment. Like an immaculate lily opening in the sun, she enters into life radiant with beauty, as chaste, as pure as the foam of the waves. I would make her appearing majestic and superb; the entire earth should come to her. For, let us insist upon it, she gives to the enraptured world unlimited felicity, inundating it with a flood of light; sensuality is replaced by the union of hearts. This searching for expression gives us at once numberless accessory personages.

Recall the pictures that have been made on this subject, and you will be struck by the small degree of logic, the little common sense there is to be found in them. Their authors have lived more through their eyes than by their hearts and brains.

Raphael, in a picture that is entitled the "Triumph of Galatea," but which I think should perhaps be called "The Birth of Venus," has understood nothing of the subject. I say so, in spite of all clamors and the fact that it is the custom to call it a *chef-d'œuvre*. Evidently it contains charming points, admirable from a plastic point of view, but, from an æsthetic point of view, nothing. Beautiful forms, always beautiful forms; Raphael is always harmonious, elegant, but he has never emotions,—he is never a true thinker. If Raphael, if Titian, have not grasped this subject, what shall we say of others who have attempted it?

It is in seeking the human side, the intimate side, that you will solve the enigma. Your joy, your conviction, your entire nature should contribute to your work. You must live that which you would paint.

Fifth Lesson.

Subject of Sketch: Romeo and Juliet.

WHEN you would take a subject from a legend, a drama, or a poem, you must know

how to find the characteristic of the work; you must be able to choose the situation that will give the most complete idea of the poet's creation. This or that episode would only be an illustration. It is the synthesis that you should give,—the entire essence of the work thus passing into your picture, and not a mere reflection of the thought of another.

What is Romeo? What is Juliet? It is not by reproducing this or that scene of Shakspeare's drama that you can paint these creations of his genius. It is in presenting them in their most striking aspect that you best convey the idea you have formed of them. If you represent only the griefs, the tears, the death of Juliet and her lover, you give but one phase of their existence; you have not expressed them.

Before all and above all, they are the expression of love—love with all its youth, all its ardor, its heedlessness, its apprehensions, and its delirium!

I have given you this subject of Romeo precisely to see if you understand what is the dominant emotion, and to recommend you always to seek for it. Now, the dominant note of "Romeo and Juliet" is, we have said, love; as "Othello" is violent jealousy, as "Macbeth" is an inordinate ambition, as "Hamlet" is a painful reverie mastering a fine but unbalanced intelligence, born for a calm life, but forced into action.

Ask yourselves then what Shakspeare aimed at in writing his drama. Lovers, did he not? You must paint, then, lovers. If you had this story to illustrate, you would make drawings of the duel, balcony, or grave scene,—making your compositions more or less dramatic. But when you have "Romeo and Juliet" to characterize, you are bound to give appropriate expression to the sentiment that exhales from the whole work.

Any other subject presenting the same characteristics of passionate and exalted love would interest us equally. It is the picture of love that moves us, not the personality of those who experience it. Ask your heart how to paint Romeo and Juliet. It will give you a response. Then you will be eloquent.

That which will make the celebrity in the future of all of us who are occupied with art, will not be our cleverness, but perhaps a little ray of personality. You will be nothing if you imitate another, be he ever so great; you will be some one, even the humblest of you, if you are true to yourselves. You must love glory more than gold, art more than glory—and nature more than all.

JOHN BODEWIN'S TESTIMONY.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "Friend Barton's Concern," etc.

X.

THE VALLEY TRAIL.

MRS. CRAIG, having entered upon a scheme of entertainment for her young guest, pursued it with enthusiasm. Even the amusements of that unrestful place and climate took on a certain fierceness of energy. The mountains were a perpetual challenge; the valley, with its bright, sinuous river, running out of sight among gray willows, a perpetual invitation. Pleasure hurried its pace at the brief summer's warning. Quick pulses beat themselves out, and young life that exulted in perilous effort sank before the prize was won, and gave place to the next champion of the hour. Josephine was half fascinated, half troubled by the spirit of the place. Her mornings were gay, but her evenings were restless and often mysteriously clouded. With Mrs. Craig as chaperon and Mr. Hillbury as guide, she had climbed her peak, had gone down into her mine, had visited smelting furnaces by night and hydraulic washings by day, had caught her trout in the waters of the "Lake Fork," and had her thrilling gallops in the valley. She had talked and laughed more than ever in her life before, and never had she been, perhaps, less soundly happy. She had met Bodewin constantly, but their acquaintance, which had burst the bud with such a shock, seemed likely to wither half blown. Bodewin had relapsed unexpectedly from his stress of confidence into a silence and backwardness which to Josephine could only signify some decided change in his feelings towards herself. Not to seem to remind him of his former peremptory claim on her sympathy, she carefully avoided any allusion to the day of their long argument on the rocks; nor did Bodewin ever refer to it. They were not often alone together, but when they were, Bodewin found it more difficult than he would have believed to tell his story to this young girl. There was an appalling egotism about it. In one way it would be like telling it to a summer morning. He and his troubles would rest almost as lightly on her consciousness, so he reflected; but the morning did not fix such disturbing eyes upon one's face when appealed to. One opportunity after another he let slip,

until a day came which found him again lounging along in his saddle at Josephine's side. They were riding in the valley with twenty miles of unbroken turf before them, and not a human creature or habitation in sight. Beyond the next long swell there was a milk ranch where they were to wait for Mr. Newbold and Mrs. Craig, but that was yet three miles away. A wind, steady and soft, blowing up through the great gate of the mountains, ruffled the wild grasses on either side the trail. The river showed, in sunny, pebbly reaches, between the pale willows turning silvery in the breeze. The snow-born Arethusa was not swifter-footed or more musical than this unwritten, unsung Arkansas of the high valleys, not a day's journey from its cradle. They had galloped until their blood was up; they had paced side by side in silence till it had subsided into the warmth that is just enough to give a man daring for a difficult topic of conversation. Bodewin found that he needed all his courage. The summer-morning theory was all very well, but when, at the first grave accent in his voice, Josephine turned upon him that beautiful dark regard he feared and yet longed to meet, his heart grew weak within him. He told his story badly, touching reluctantly on the points where he was sorest, omitting parts of it altogether, and in his dread of overstatement consciously making the worst of his case.

"You understand," he concluded awkwardly, "that when I surveyed Harkins's two claims it was not a business transaction. He did not employ me. I am not a surveyor of mineral claims. Harkins's discovery was one of the first in the camp, and at that time there was not an accredited surveyor within a hundred miles. I offered it as the first service it came in my way to do for him—the first installment on my debt. You see what a thing it would be to use it against him in court—the record of this affair between us—not of business, but of honor,—to defeat him by means of it. It would be like trapping him in the name of my boasted gratitude. I would rather be shot than do it."

"Still, I think you will do it," Josephine said.

"Would you mind telling me why you think so?"

"Because if you had been satisfied not to do it, those words of mine would have been forgotten as soon as they were spoken."

"I never said I was satisfied *not* to do it, but that is a very different thing from doing it."

Josephine was silent.

"Many things," Bodewin continued, "which are purely matters of private business get abroad in a place like this. Harkins knows I have once positively refused to testify against him. He also knows that I have since been offered in set terms a large sum of money by the parties who wish me to do so."

Josephine blushed painfully at these words, but Bodewin went on without perceiving her embarrassment.

"Stating the situation roughly as a man like Harkins would see it, what motive do you think he would be likely to impute to me were I now to change my mind? Would he not think I had consented to do for money what I had refused to do from an honorable motive?"

"Would he think you had been bribed?" asked Josephine.

Bodewin suddenly remembered that he was on dangerous ground. It was so difficult to keep the fact of Josephine's antecedents in view. He avoided the question.

"Theoretically, of course, Harkins's opinion of my motives is of no consequence, but actually I cannot afford to disgust him with me while he has this hold upon me. He is capable of anything. Chivalrous as he was to my sister in her extremity, the heart of a gentleman is not in him, or in any of his kind. He would spare no man or woman, living or dead, to reach me, if he believed I had betrayed him. I cannot sacrifice my sister's name even to truth and justice."

"Do the dead require more of us than the living? I am sure no living sister could endure that her brother should be hampered in his public duties by his love for her."

"You have quite the Roman idea of the comparative insignificance of the family claim," said Bodewin, smiling rather bitterly; "but you have a right to it. You come of heroic blood."

Josephine turned upon him. "What do you know of my blood?" she asked, searching his face for the touch of irony she suspected him of. She was restive on the point of blood from a mixture of pride and uneasiness: pride in the strain on her mother's side, and vague distrust of that on her father's, with which she found herself year by year less in sympathy.

Bodewin hastened to repair his blunder. "I beg your pardon. The story of your grandfather's martyrdom has become a part of history, you must remember."

"Yes," said the girl, softening in her quick, responsive way, "the men of my mother's family thought they were truest to their own families when they were truest to their own best beliefs. But perhaps you think my grandfather should have yielded everything for the sake of security for his wife and children?"

"Oh, now you are too hard upon me! At the worst, if Harkins were to carry all before him through my poltroonery, it would not be a national crime."

"Oh, wouldn't it? Isn't appropriating other people's goods becoming a national crime? Then we cannot believe our own prophets." Josephine was too young in controversy to have learned to keep the excitement of it out of her voice. She forgot her resolution to abstain from trying to influence Bodewin's decision. She was passionately protesting against it with her eyes and burning cheeks as well as with her words.

"Are you sure it is the family claim after all that is hindering you?" she asked finally. "Is it not your own pride? Are you not trying to cancel a private debt by neglecting a public duty?"

Bodewin's answer came slowly. He had asked himself a hundred times why he should sacrifice to the protection of another man's property that which was much dearer to him than any tangible possessions of his own. But between these two the question had never been for one moment a question of property; each would have scorned in the other the first intimation that it could be. Bodewin only said, "What impossible beings you must think us! If you knew men better, you would not expect so much of us."

"Do you call it so much? I shall never expect less—never—of any man I believe in!"

The ranch was now in sight, and they rode the rest of the way in silence. Not one of the family, except the cows, was at home, nor were Mrs. Craig and Mr. Newbold anywhere to be seen. A paper pinned on the door bore an explanation in Mrs. Craig's handwriting:

"Ranchman's wife at the railroad camp. We are going on there to see her about the eggs. Wait for us or not, as you please."

The railroad camp was a mile distant up the valley. They decided to wait. Bodewin dismounted and lifted Josephine from her saddle. She found a seat on a long bench against the side wall of the larger cabin, while Bodewin looked about the premises to make sure no one was at home. Two long low cabins of unhewn logs, built about four feet apart, were united by their roofs. The covered way between framed a view of the valley in the slanting light of afternoon. Through the uncurtained windows it could be

seen that one of the cabins was used for a dwelling, and the other for granary, barn, stable, woodshed, and other purposes. Its interior was crammed like a schoolboy's pocket, and was nearly as dark. Absolutely the place was deserted except by the cows, pensively chewing their cuds in the corral behind the cabin.

Bodewin seated himself on the bench near Josephine. He took off his soft felt hat and crushed it on the angle of his knee. As he leaned forward on his elbows, his profile strongly illumined in the sun's level light, certain merits in his appearance which had escaped Josephine's diffident observation now struck her for the first time. His eyes, that she had thought were black, proved to be a dark hazel-gray. The wind loosened a lock of his close-cut hair, brushed with unbecoming severity of outline, and blew it across his forehead. Instantly he looked the younger and the better for it. She noted the modeling of his bent head, the delicacy of his complexion where his hat had shaded it from the sun, the high, clear-cut lines of his face. He looked like some keen-edged instrument, fit for precise and subtle uses. He had not found his true work as yet, that was evident; and Josephine vaguely wondered whether so efficient an instrument carelessly handled might not be dangerous to others, or itself get dulled or broken.

While they waited the sun's red disk touched the mountains; it dropped out of sight; the mountains darkened against the after-glow that spread broadly over the plain and flamed upward, gilding the long cloud-islands that rested in the upper regions of the sky.

"Mr. Bodewin," said Josephine, after one of those silences that often fell between these two unconventional acquaintances, "why should you feel that you alone are responsible for your sister's marriage? She had a mother as well as a brother—and you were very young."

"My mother was scarcely in the world that summer. She lived with her dead. And she was broken—by——"

"Forgive me!" Josephine interrupted.

"You do not hurt me. Say anything to me you like. It helps me."

"I would like to say one thing more, if I may. I am sure it would trouble your sister's rest if she could hear you saying what you did just now—that she had a mortgage on your life for all you were worth, and that now a part of it had fallen into base hands. Can any one hold a mortgage on our lives except the Giver of life itself? It seems to me you leave out—God."

"Would you have me throw the consequences of my carelessness upon Him?"

"I would have you believe that your sister was in His care as well as in yours."

"It would make a pagan of me if I could believe God meant her life to be what we made it—among us."

"I am afraid you are a pagan already."

"Very likely. And being a pagan, I am also a coward."

Josephine hated to hear a man call himself a coward, even for the sake of being contradicted. She hesitated, and then, smiling, said deliberately, as if speaking by rote:

"I would not hear thine enemy say so."

Bodewin smiled too, rather sadly.

"The context made you say that, but you do not mean it."

"I can never tell how much I mean until I am tried," she said, "but I think I mean it."

"What should you say to one who called me a coward?"

"I should say that if you were it could only be as 'conscience doth make cowards of us all.' And to myself I should add—morbid conscience."

"You think I am morbid?"

"I hope you are, for if your views of our mutual accountability are true, then life is not difficult—it is impossible."

"Well, is it not impossible? Life, as it was meant to be?"

"I do not know how it was meant to be. I believe that it is, that it will be, full of happiness—I do not mean pleasure—to those who hunger and thirst after righteousness, even if they make terrible, terrible mistakes. I cannot believe in those fatalities which make one man the destroyer of another, whether he wills it or not. The intention must count for something."

"We cannot live by our intentions," said Bodewin. "I think I see your father and Mrs. Craig coming. They are a long way off, do you see? Where the trail cuts in towards Bird's Eye Cañon."

"I wish they had come before I began to talk of things that are beyond me," Josephine sighed.

"There is nothing beyond you—nothing worth mentioning."

Whenever Bodewin said anything to Josephine that she might have resented as flattering in its tendency, he did it with a dismal reluctance which made it a thing to pity him for.

He was getting restive under a deepening sense of her truth and sweetness. He would have been glad to find a flaw in her,—another flaw,—for since he had made her atone to the uttermost for that slip with which their acquaintance had begun, she had been steadily triumphing in his thoughts.

He had long ceased to be even amused at their relations to each other with reference to the trial — Mr. Newbold's daughter helping her father to his most important witness. He would have felt like choking any man who dared to hint at the convenience of such an arrangement for Mr. Newbold. He adored her unconscious sincerity that ignored the world and feared no misconception. And he felt the tribute to his own manhood it so simply yet subtly conveyed. He was able to speak of her to Hillbury that evening with calmness, however, and to agree with his friend in his favorite theory, that a woman must have a certain amount of self-consciousness to escape being crude. Hillbury was apt to take a cool, disparaging tone in speaking of the average pretty woman, but Bodewin could not believe in Hillbury's entire indifference to a girl he himself found so charming.

XI.

AN ANONYMOUS LETTER.

BODEWIN had left his horse at the stable and had overtaken Hillbury as the latter was strolling along the ditch-walk, reading his letters on his way back to camp. Hillbury put up the letters as Bodewin fell into step beside him.

"I tried to find you this afternoon, Bodewin. Where are your rooms now?"

"Rooms! My *room* is in the Parker building, second story, front, if you want to see me on business."

"You have more than one room there."

"Well, if you count a man's bedroom."

"I wanted to tell you you've won your cigars."

"What cigars?"

"Have you forgotten our bet about Craig's cabin?"

"Craig's cabin?"

"The cabin in the Lake woods—the girl-and-pup story."

Bodewin's face changed slightly as he replied:

"Yes, I remember." *

The mention of the Lake woods called up other impressions more vivid than those connected with Craig's adventure.

"You were right about Craig—there is no cabin there."

"What did I say about Craig?"

"You said the little boy lied, and apparently he did."

After a pause Bodewin said:

"Craig may have lied on occasion, but he is not a liar. If I ever said that he was, or implied it, I lied myself."

"Well, the cabin cannot be found. I'll send the cigars around to-morrow."

"I won't take them, do you understand? I don't want to smoke a whole box of cigars flavored with a stupid fiction of Craig's. I'd rather borrow them of you one at a time," he added, as Hillbury looked grave, "and no thanks to Craig."

"You still insist there is no cabin," Hillbury persisted.

"Hang the cabin!"

His words, few as they had been, convinced Hillbury that Bodewin was himself surprised that the cabin could not be found. His pretended incredulity, he believed, must have been pure recklessness founded on his dislike to everything Craig did, or the joking of a tired and hungry man; or else, for some reason impossible to guess, Bodewin had not been perfectly frank. The impression was so strong that Hillbury resolved to make one more search for evidence of the truth of Craig's story.

THE outer door of Bodewin's office in the Parker building had a slit in it, and a box nailed on the inner panel for the convenience of callers in his absence. When he returned to his lodgings that evening, Bodewin, after striking a light, examined this box. It contained but one letter, from a most unattractive correspondent, to judge by the superscription. The envelope bore no postmark; the letter was undated. It read as follows:

"Do not go on the witness stand unprotected. Colonel Harkins swears that if you testify against him you shall not leave the court-room alive.

"A FRIEND."

Bodewin sent a letter to Craig that night, short but carefully worded.

His testimony, he wrote, in the case between the Eagle Bird and Uinta mines, was at the service of the Eagle Bird. He would prefer to give it in response to a subpoena, in due form. He would take his expenses and the usual witness-fee, nothing more, and the question of money need not be referred to again in reference to this case. And he was Mr. Craig's respectfully. This letter Mr. Craig handed to Mr. Newbold the next day as they sat together on the Eagle Bird piazza waiting to see the superintendent on a small matter connected with the lawsuit,—a matter which made it necessary for Sammis to look up some old maps of the mine. Josephine had gone into the house to see Mrs. Sammis's baby. She had found him in the dining-room, seated in his high chair at a table where his mother was engaged in cutting out the overskirt of a new grenadine dress. Josephine was consulted

as to the proper length to allow for draping, and as baby gave more of his assistance than was desirable, making dashes at the paper patterns and side pulls at the stuff spread smoothly on the table, Josephine seized him out of his chair and bore him off into the front room, where she made him happy in a way he knew well. She placed him on her knee, facing her, at arm's length, and, with her smiling eyes fixed on his solemn ones, began softly jogging him up and down to the recitative, "This is the way the lady rides," etc. As the pace grew better, his fat shoulders began to shake and the dimples to show round the deep-sunk corners of his mouth; but when it came to "Hobble-de-gee the farmer goes!" his content knew no bounds. Now they began once more with "This is the way the lady rides, nimble namble, nimble namble," and the gait was so easy and the song so low to match it, that Josephine could hear her father's voice, speaking to Mr. Craig in the porch outside. The shutters were drawn together, but the windows were open.

"Well, what did I tell you? It has come out just as I said it would!"

"How was that, Mr. Newbold?"

"Don't you remember what I said to you down there in your office?"

"About Bodewin? You said, if I'm not mistaken, that his case called for a woman's influence; wasn't that it?"

"Well, what I meant was the social thing, you know. Of course, you can't have society without women. He has seen a good deal of us lately, and naturally he takes more interest in the case. He's reconsidered the matter from a more human point of view."

"He has not seen much of me lately. He has seen a good deal of my wife and of your daughter. Is that the point of view you call human?"

"You lawyers are the worst fellows to turn a man's words wrong side out. You know very well what I mean. Bodewin has come round—most unexpectedly to you, but not to me. I knew he was coming. The rides and the talks and the little dinners have done the business, and now you can come in with the majesty of the law and claim the credit of it."

"To whom is the credit due, do you think—your daughter or my wife?"

"Oh, come, Craig! I'm not going to quarrel with you—not until after the trial."

"There will not be any trial with me for your counsel, Mr. Newbold, unless you drop that little theory of yours, pretty sudden too! You can give all the credit you like to your daughter,—I beg her pardon, and you ought to too,—but I want you to understand, before

we go any further, that my wife doesn't help me to win my cases."

"Good Lord, man! one would suppose——" Josephine sprang up, hardly conscious of the heavy child in her arms, and carried him back to the dining-room, where Mrs. Sammis was folding up the breadths of her overskirt.

"I do believe there is enough left for a shoulder-cape," she said without looking up, as Josephine entered. "Don't you like those little shirred capes?"

"On some people—yes," Josephine replied absently.

"If there wasn't enough to shir, I might put some fringe round it, and trim it with passymentry—Ain't you been tiring yourself out with him? You look real warm!" She held out her hands for the child.

"He doesn't tire me—does he, monkins?" Josephine leaned her head against the baby's clean white pinafore, put on over yesterday's frock with especial reference to her visit. He clasped the bent, dark head in his chubby arms, patted it vigorously, and then pushed himself away from her that he might peep down into her face. Mrs. Sammis looked on with flattered regard.

"You've got a real way with babies!" she said. "For an only child yourself, it's wonderful. I guess you're one of the born mothers. You must look out when it comes to marrying. When you see a girl with blood in her for two, she's sure to pick out a man that hasn't half enough for one, and nurse him the rest of her life, and be as proud of him, like as not, as if he was her first-born, and think he's got a terrible intellect."

Josephine, in her visits to the mine, had been in the habit of using the Sammis baby as an innocent sort of buffer to ward off the mother's attentions. That day she kept the child in her arms, petting him and recklessly encouraging his small tyrannies, until the horses were brought round and her father called to her from the piazza that it was time to go.

Nothing in all her life had ever hurt her like those words of his she had overheard. Josephine had ever been too ready to flame out on slight provocation, and dispute the paternal judgment and sometimes the paternal authority on trifling points, but this issue involved differences too vital even for discussion. She could not open the subject to her father without showing him her scorn for his point of view. All the satisfaction she might have had in Bodewin's conversion was blighted. Reviewing his several conversations with her as she was able to recall them, she fancied she could read her own humiliation in his cold

surprise, his mocking appeal, his abrupt and intimate demand. The first slip had been hers, but she was now ready to believe her father had done his best to put her in the way of making it. He who should have saved her from her faults had been in league with them against her — was openly exulting in their consequences, with an indecency of suggestion which had disgusted even Mr. Craig. The object of her soliloquy was meanwhile comfortably riding behind her, by the side of Mr. Craig, talking of future improvements at the mine to be begun as soon as the trial was over. For now that Bodewin had been won, Mr. Newbold, and his lawyer no less, regarded the case as virtually decided in their favor.

XII.

DEAD OR MISSING.

MR. NEWBOLD wondered a little that Josephine's interest in the trial should have so suddenly cooled. But no doubt she was tired of the subject; it had been presented to her somewhat monotonously of late. She declined to go down with him to Denver on the week of the trial, preferring to stay at the mine with Mrs. Sammis. It would not be an exciting visit, but Josephine would have chosen to go back alone to Kansas City rather than make one of the Eagle Bird party on this conspicuous occasion. Mr. Newbold had hired a light mountain-wagon and a team of horses to carry his constituents over the range to the end of the track in the safest and speediest manner. He had also ordered the best breakfast the Wiltsie House could furnish, to be served at the mine, where the party were to meet on the morning of the journey.

Bodewin had been as good as his word when he told Josephine that he would take no advantage of her reluctant consideration of his difficulty. She had not seconded her father's numerous invitations to him, and had met him only through their mutual acquaintances, Mrs. Craig and Hillbury. One of Mrs. Craig's children had been ill, and the outdoor gayeties of her planning had ceased for a week before the date of the trial. During this time Josephine had not seen Bodewin. She would gladly have escaped the breakfast, but her father had made a point of her presiding. However, to her great relief, Bodewin was not among the guests. At the last moment he had resigned his seat in the wagon and announced that he would make the pass on horseback.

"We shall see you to-morrow at breakfast?" Mr. Newbold had asked, and Bodewin had begged to be excused, as he was not an early breakfaster and would not need to start as

soon as the team, by an hour at least. He came loitering up the trail a few minutes after the Eagle Bird party had set off. He had left his water-proof coat in Sammis's office the last time he had gone through the mine, he said, and had stopped for it on his way.

Josephine was sitting on the steps of the high porch as he rode up. He had seen her, and it was too late for her to escape into the house. She smiled collectedly enough and said good-morning, while Mrs. Sammis came from the end of the porch, holding a leaky watering-pot at arm's length, to ask if he would not change his mind and have some breakfast. He had had a cup of coffee before leaving the camp, he thanked her, but would she kindly send some one for that coat? The office was locked and Sammis had taken the key, but Mrs. Sammis thought she knew where there was another key that would fit. She went into the house to find it, and Bodewin seated himself on the steps below Josephine. His first look at her, before a word had been spoken, assured Josephine that she was safe at least in his regard. But that did not take away her trouble by any means. It might have been better that he should despise her. No one could have guessed from Josephine's appearance that she was unhappy, still less humiliated, about anything. Bodewin was looking at her timidly; he had never seen her before in a white dress. It was only a white flannel, made in the simplest way, but a garment of white samite could not have been more mystic and wonderful to Bodewin's inexperienced eyes. It defined her fair arms and shoulders and clung in some mysterious way about her hips, sweeping downward in long soft folds over the pleatings that huddled about her feet. Bodewin could not venture to more than glance at her as she sat on the steps above him. It was scarcely possible to avoid some reference to the object of his journey.

"Are you surprised at my going, after all I said to you that last time?" he asked.

"No; I knew then, in spite of what you said, that you would go."

"Thank you for your faith in me. I ought to be uncommonly happy, I suppose. True happiness consists in doing what is disagreeable, doesn't it?"

Now that Bodewin had begun to talk in this safe, artificial strain, Josephine's courage returned.

"Perhaps so," she said, "if you do it for the sake of something better than happiness."

"You are the most exacting young moralist! Isn't it enough that you have got me on the right track at last, without asking for my passport?"

Josephine's face turned scarlet.

"I have had nothing to do with the track that you are on."

"Am I not your witness?"

"You know that you are not. Remember, the condition of my listening to you was that you should not make it personal!"

"You repudiate me altogether, now that I am doing what you wished me to do. You don't deny that you do wish it?"

"If it is merely a question of what I or any one else wishes you to do, you had better not do it."

Poor Josephine was insisting all the more strenuously on the dignity of her position, now that she herself had lost all faith in it; and Bodewin was irritated by this display of rectitude, when he was longing for something less comfortless to a man starting on a journey attended by risks known to no one but himself.

"Such very abstract views of duty as yours strike me as a little inhuman," he said,—"to adore a man's duty and yet spurn him for doing it."

"I do not spurn you — neither do I intend to applaud you."

"I don't ask you to; I ask only a kind word of good-bye, and some little recognition of the fact that I am going on your errand. That is very weak of me, perhaps."

"But you are not going on my errand. What right have I to send you on my errands, or you to go?"

"I might go on your errand without your sending me."

Josephine shook her head. "How can you play with a serious decision like this, even for the sake of teasing?"

"Why should it tease you? I should be glad to relieve you from that horror you seem to have of any complicity in my acts, but I hardly think I should be riding over the range to-day if you had not challenged my right to do as I pleased."

Since there was no denying that his motives were mixed, Bodewin was resolved to get what comfort he could out of the mixture. He wished Josephine to feel that this act of his was in some sort a bond between them, and she resisted the acknowledgment he was forcing upon her with maidenly fierceness.

She stood up, facing him, obliging him to rise, though he was in no hurry to go. He leaned heavily on the balustrade, avoiding her eyes.

"Don't go," she said more gently; "don't give your testimony from any motive less worthy than the one which made you withhold it."

"Be satisfied," he said; "I am doing what is right. I don't ask myself why I am doing it,"—he lifted his heavy-lidded, passionate

eyes to her face,—“and you must not ask me, because I might tell you the truth.”

He took off his hat and silently offered his hand. Josephine let him hold hers a moment, and they parted without looking at each other again. As Bodewin was unhitching his horse Mrs. Sammis appeared.

"You're not going without your coat, Mr. Bodewin?" She came down the steps with it, apologizing for having kept him waiting so long. "I hope you won't have to ride too fast to make up the time."

Bodewin assured her he had plenty of time. He rolled up the coat into a snug bundle and tied it securely with the leathern thongs attached to the back of his saddle, swung himself on his horse, and, lifting his hat to Mrs. Sammis, rode away.

Twilight drew the curtains of sunset in the valley. Night came on, and the Eagle Bird folded its murky wings in such rest as its ceaseless subterranean life permitted. Josephine sat on the porch steps. She had been alone nearly all day, for, though nominally the guest of the superintendent's wife, she saw very little of her hostess. The superintendent had married, as in small, isolated communities, the average man marries the woman he had seen most frequently. In Sammis's case she had happened to be a garrulous soul in an under-vitalized body. Mrs. Sammis had stamped her feebleness with the force of a fatality on her husband's life, his house, and his children, suffering herself more than Sammis, perhaps, from this repetition of her own negative personality. There was a dreary inefficiency about the conduct of affairs in the household she now found herself part of, that had already begun to weigh upon Josephine like a trouble of her own.

At the dump station below the hill a light had shone since twilight. At intervals she heard the hollow rolling of a car along the tramway. As the sound ceased, a bolt rattled, and the torrent of earth and stones crashed over the dump. The car rolled back into the tunnel, and in the succeeding silence the strokes of the engine from the shaft-house counted the hours to the change of shifts. Presently a new sound caught Josephine's attention—the light, sharp click of a horse's hoofs coming rapidly up the hill. She lost it for an instant, then she heard it again, nearing faster and now close at hand. By the main group of buildings it stopped, and voices of men were heard talking.

Mrs. Sammis came out on the porch, carrying the baby, her apron turned up over its bare head. She walked past Josephine to the end of the porch, and called into the darkness:

"Whose horse is that?"

There was no audible reply, and she repeated the question. "Whose horse is that?"

"Is anything the matter?" Josephine asked. She too went to the end of the porch and looked and listened with Mrs. Sammis in the contagion of vague alarm.

"I thought that horse coming up just now was the bald-faced one Mr. Bodewin rode," Mrs. Sammis said.

"Has Mr. Bodewin come back?"

"It wasn't Bodewin rode him in. I saw him plain enough coming up the hill. It was that man from Lounsberry's stables. I can't ever think of his name. He brings your father's horses."

"But where is Mr. Bodewin?"

"That's what I'd like to know, if I could get anything out of them men!"

"Let me take the baby, Mrs. Sammis."

The sleepy child began to scream when his mother transferred him to Josephine's arms. She carried him into the house and walked up and down the close entry with him, mechanically hushing his cries, while Mrs. Sammis ran out to the stable to make inquiries.

"Oh, baby, baby, *do* hush!" Josephine almost sobbed herself, trying to listen.

In a few moments Mrs. Sammis returned. The baby was still screaming, and with a mother's sententious sympathy she took her offspring into her own arms and carried him into her bedroom, where Josephine heard her singing her habitual lullaby —

"Safe in the arms of Jesus,
Safe on his gentle breast."

The measured creak of a rocking-chair continued for some time after the singing had ceased. Then Mrs. Sammis came out of the room, carrying a smoky kerosene lamp in her hand. She placed it in the center of a table with a red printed cotton cover on it, rearranged the books in little set piles around the lamp, and finally sat down by Josephine at the window, sighing audibly and stroking back her hair with her thin, moist, bleached-looking hands.

"Well," she said, "*they* don't know what's gone of him any more'n we do! That bay horse of his come in alone about seven o'clock, and walked himself into the stable where he's kept", and that's all they know. They waited till the stage got in, but there wasn't any message from our folks. They passed our team the other side of the summit, but they hadn't seen any sign of him either side. He hadn't stopped at English George's, but just at the foot of the pass,—you rec'lect, when you come in, that little gulch where the water was, and right smart of grass? The woman says she was just takin' some blackberry pies out of the oven,—one of them outdoor ovens;

you've seen 'em,—and he rode up and bought one of the pies, and et it settin' on his horse, and took a big drink of milk, and give her a dollar. T'wasn't more'n three bits' worth. They sent up from the stable to know if he changed his horse here this morning before he started. *You* saw him tie that coat on to his saddle, didn't you?"

"Yes," said Josephine.

"Well, *they* say the saddle came home bare."

"Bare?"

"There wasn't any coat or nothing tied fast to it."

"What does that mean?"

"It means it wasn't an accident." Mrs. Sammis lowered her voice to give greater effect to her next words. "*They* think, down to the camp, it's some of the Uinta's work. The horse had been hit by a bullet, and they say the mark of it showed it come from behind.—There is no tellin'," she continued after a pause, which brought no comment from Josephine. "Some thinks he's just been playin' into their hands all along. He give 'em a first-rate chance, goin' off alone like that. Sammis has 'lowed all along that he was in with them."

Josephine rose and went out on the porch. The air was of an unusual softness. The stars between the pine-trunks seemed few and very far away. She watched the light of a lantern swinging from the hand of the night foreman, who was crossing the trodden space before the shaft-house, and listened to the sluff, sluff of his rubber boots as their loose tops rubbed together at every step. The light at the dump station was eclipsed, and now again came the rattling of the bolt and the plunging of the load over the dump. It fell into the echoless silence of the wood like a stone in a deep well. So had the news of the night fallen into Josephine's heart. She heard Mrs. Sammis's step in the hall, and turned to say:

"Will you tell me as soon as you know anything more — whatever it is? I want to know it."

"Why, of course — why shouldn't you know it?"

Why, indeed, Josephine repeated to herself, should she be spared the knowledge of Bodewin's fate? What was it to her but one more man added to the list of the camp's missing, or dead, or dishonored?

XIII.

ON THE ROAD TO THE PASS.

It was nearly noon when Bodewin reached the foot of the pass. He had left the ticklish places on his road behind him—the deep woods, the wet stony hollows, the winding

gulches with high rocky walls that shut out the sun. The secluded trail he had taken now met the stage road, where passengers were frequent. The chances for an adventure on that exposed highway were hardly worth considering. Bodewin kept a quietly watchful eye on each turn of the road or projecting angle of rock, as a matter of habit, rather than of special precaution.

As he slowly climbed the last half mile to the summit, he heard some one shouting, and, looking back, saw a man on a hard-ridden horse motioning to him from a distance. He waited for the stranger to overtake him.

"If your name is Bodewin, there's a man back here in the timber has got some papers for you."

Bodewin looked hard at his fellow-traveler. He was a man of about fifty, with a tall, stooping figure, a foxy beard that was turning gray, and a scar on the side of his thin nose that made his eyes seem closer together.

"All right, boss!" he said. "Take a good look at me. It sounds like a lie, but it ain't."

"Where does your man say he's from?" Bodewin asked.

"He came out from camp, just behind you. Says he is one of the men from Lounsberry's stables. Some papers belongin' to a party named Newbold got left at the Eagle Bird mine. The women folks found 'em just after you'd gone. The young lady there, Newbold's daughter, knew they'd be wanted on the trial that's comin' off to-morrow, and she chartered him to overtake you with 'em. He promised her he wouldn't give 'em into no hands only yourn."

"Well," said Bodewin, "what is he doing in the timber?"

"Horse fell on him. He's all broke up. I come along just after he was hurt, and he got me to overtake you and git you to come back for the papers. I told him you wouldn't come, and to give me the papers. I might be all right, he said, but he couldn't let 'em out of his hands."

The ingenuousness of this speech was not borne out by the speaker's countenance, but various considerations were working on Bodewin during the few seconds it took him to choose between the risks of believing a false story and doubting a true one.

"Are you goin' back?" the man inquired. "I'm goin'. I want to git him into shape, so's he can git back to camp."

"Hold on a minute. Where did you say this man was?"

"Back here half a mile in the timber."

"All right," Bodewin said. "Go on. I'm with you."

The stranger did not look back or wait for

Bodewin, but turned his horse's head down the hill again. He turned off from the stage road into the trail by which Bodewin had come. They were soon among the trees — the stunted pines and spruces, straggling ahead of the close columns of the main forest. Here Bodewin met with evidence confirmatory of his friend's story. A gray horse could plainly be seen, a short distance ahead of them, foraging for a bite by the wayside, while near him in the sparse shade lay a man at full length on the ground. Bodewin thought he could remember having seen such a light-gray horse with white mane and tail at Lounsberry's stables. He was sure he remembered the man's face, when he came near enough to see it. He was that dark, dull-eyed youth, partner of the Irishman whom Bodewin had conversed with at his claim on the mountain. Bodewin was not surprised to find the prospector, two weeks later, a stableman. It was the way of the camp.

"You don't remember me, Mr. Bodewin," the young fellow said, lifting his sullen black eyes to Bodewin's face. "But I know you." He opened his coat and took hold of some papers that showed, projecting from an inside pocket.

"Here's the papers she told me to give you; I can't raise up." His face was darkly flushed, as with pain.

"You don't need to git off, Mr. Bodewin," the other man said. "I can hand 'em to you."

"No, you can't," the messenger objected. "I promised her I'd give 'em into his hands or fetch 'em back to her; and I won't lie to her to save him gettin' off his horse. Moses! how my leg hurts!"

With his first unguarded impulse Bodewin dropped from his saddle to the ground, and stooped frankly and compassionately to receive the papers; and at the instant he stooped he felt his pistol leaving his pistol-pocket. A hand had withdrawn it from behind. It was the hand of his ingenuous guide. Turning sharply as he straightened himself, Bodewin's head nearly touched the muzzle of another revolver.

"Stop!" a hard voice called. "If you move you're a dead man."

Bodewin did not move. A second reason for not moving had presented itself in the shape of a pistol held against the other side of his head by Miss Newbold's faithful messenger. One deep and fervent curse escaped him, and then Bodewin asked:

"What do you want?"

"We want you," the man with the scar replied. "Will you come along with us, or do you want to git?"

"Fight!" said Bodewin. "I've got a good show, haven't I?"

"We're a little too soon for you, that's a fact. Tie his hands, Tony."

"You needn't tie my hands," Bodewin expostulated. "I will go along all right."

"You'd better mean it, if you say so. We don't want to have to hurt you."

"I don't intend to get hurt. What are you going to do with me?"

"We're goin' to keep you kind of quiet for a few days. You won't have a bad time of it, if you're peaceable. We'll have to cover your eyes, Mr. Bodewin. We don't want you to get too intimate with the road we're goin'. Hand me the rag, Tony."

"Would you mind taking my handkerchief?" Bodewin asked.

The man with the scar considerably made use of Bodewin's handkerchief to bind his eyes instead of a degraded piece of calico which looked like part of a woman's apron.

"This horse will not lead," Bodewin said, when the party was mounted and ready to move; "but he will follow all right if I tell him to. One of you can ride ahead and the other behind me. I will promise not to make a break between here and your camp."

"I'll take your word on that, boss." The elder man had dropped his hard business tone for the semi-confidential drawl he reserved for social purposes. "Tony, you can lead off, and I'll close up the procession."

"And you'll do the talkin'," Tony remarked.

"Well, if I don't talk I can't say nothin'," the elder man retorted.

The procession moved on in single file, Bodewin, disarmed and blindfolded, between his two captors. He had not been in a moment's doubt as to the author of this wayside pleasantry. The plan of his capture, he was convinced, had originated in a more subtle brain than either of those selected to carry it out. What chiefly hurt him was the thought that his disappearance might be misunderstood by his friends of the Eagle Bird. His promise to appear at the trial had delayed the serving of the subpoena; they might conclude, if disposed to doubt his good faith, that he had availed himself of this solitary ride to give them the slip, even were it not planned for that purpose. If he could but send some message back! The thing seemed as little possible as to escape himself. All that, however, could wait. Deprived of eyesight, his remaining senses were doubly on the alert to report each feature of the road. By the sound of his horse's feet he knew they were still on the trail. They followed it but a short distance, perhaps from fear of meeting other passengers, then, turning to the left, struck

across a gravelly ridge. Bodewin recognized it as one of those numerous lateral moraines making lesser valleys at right angles to the great valley of the Arkansas. The plan of march was not adapted to conversation. Occasionally a voice would admonish Bodewin: "Down your head there, pardner! Dodge that tree limb"; "Watch out for them quaking asps"; or "Mind that badger-hole on the up-hill side."

The ridge, inclining always towards the valley, dipped suddenly, and the horses took the slide one after another, carrying soil and stones with them. Bodewin made no attempt to guide his horse. He had trusted Baldy's feet and Baldy's eyes on many a dark night and blind trail. At the foot of the ridge they crossed a piece of timber, and beyond it Bodewin could hear the horses' hoofs sucking through the swampy bottom. Now they were rustling past a willow thicket, now wading into the coarse, bunchy grass of the valley pasturage; southward again, the soft valley wind in their faces, the sun declining from the zenith towards the west. Now into a gorge, grassy at first and wet, then steep and stony, with a coolness as of rocks high and near. Bodewin was positive they had not crossed the valley. The plan was probably to wind him in and out between those narrow divides which radiate from each great peak downwards into the valley, until he had become confused, then double on their track and bring him to some spot not far from the camp itself. Another reason for making such a mystery of their route occurred to Bodewin. His abductors no doubt were arranging matters so that after his release he should not be able to swear to the place where he had been detained.

The last hour of the ride was through interrupted woods, and here no idea of their direction could be had. They were not the burnt woods; the shade was close and dark, the horses' feet sounded hollow on the muffled ground.

"In sight of camp, pardner," said the elder guide. "You can pull off the blinders."

Bodewin took the handkerchief from his eyes and looked about him with keen interest. He was turning a new page of his experience, which was likely to prove exciting, if not instructive. The wood was in shadow. Only in the tree-tops the sunlight lingered, letting fall a gleam here and there, to burnish a trunk, or speckle with tawny lights the dark-red forest floor. Beautiful and solemn and peaceful as night itself, the pine woods stretched before him. Was not this a better ending to a day's journey than the one he had set out for?—the crowd on the platform

at the new railroad terminus, the noisy car-load of people, the train banging along the break-neck grades of the Platte Canon, and the trial and the witness-stand? The decision had been taken out of his hands, and Harkins was getting even with his debtor in a unique fashion of his own. Bodewin's courage was of a deliberate and philosophic kind. He was too indifferent to danger to seek it, nor was he possessed by that necessity to fight under any provocation which belongs to men of the "game" variety. He was game in a somewhat different sense. He had remained quiet when he found himself disarmed, with a pistol at each ear, not from fear of the pistols, but from an objection to an illogical suicide. His blood had been cool enough to let his mind work, and to Bodewin's mind to have invited death at such hands, and in such a manner, would have been supremely objectless and silly. Yet there was a taint of moral poltroonery in him. It revealed itself in the relief with which he welcomed the utter irresponsibility of his situation. From a man who had been morbidly conscious of his responsibilities, he had become one who was sick of the very word. He was almost glad to be deprived of his rights for a time, that he might enjoy a corresponding suspension of his duties. He had got down now to the ground floor of social ethics, where the law of self-preservation was uncomplicated by subtleties of mutual obligation.

"In sight of camp," the man with the scar had announced—and now the camp itself was close at hand. Where had he known this place before? The long-backed cabin, overtopped by the dump of a deserted prospect-hole, the bench under the projecting roof, the little corral. This was Craig's cabin, beyond a doubt, even though Hillbury had failed to find it. Bodewin was charmed by the sequence of events.

XIV.

A MESSAGE TO THE CAMP.

THE three men dismounted at the door of the cabin, leaving their horses standing. Bodewin untied his blanket-roll and rubber coat from the back of his saddle, and tossed them on the bench beside the door, while Tony, seated on the bench, kept an eye upon him. The elder man, whom Tony called Dad, had gone into the cabin. In a few minutes he returned, laughing and shaking his head.

Tony's look expressed sulky inquiry as to the cause of his merriment.

"Babe's mad," he explained. "Says she won't have no men folks round, inside there, till grub's ready."

"What's she mad about now?" asked Tony.

"About this yer company we brought home," said Dad, winking at Bodewin. "She 'lows she don't take no hand in this kind of entertainment. She'll give you enough to eat, though," he added.

"Why don't you go in there and make her quit?" Tony suggested.

"Go in yourself, if you want to. I've learned to let women folks alone when they are plumb full o' mad."

Tony went to the door and tried to open it. It was fastened from within.

"Babe!" he called, "*Oh* Babe! Come out yer! *Ain't* ye 'shamed!—Give you a dollar if she don't come," he said to Bodewin parenthetically.

Bodewin laughed.

"Give you forty if she does!" Dad jeered.

Tony continued calling and pounding until the door on a sudden was violently thrown back and Babe herself appeared on the threshold, fronting the cool daylight, with a glow of firelight behind her, which reddened the murky interior of the cabin.

Babe was a tall, white-throated, full-bosomed girl of seventeen, at this moment red with wrath, her blue eyes big and dark under her low, flat, white brow. Her skin was white as birch-wood stripped of its bark, but under it were muscles as tough as Tony's own.

"Who's callin' Babe round yer?"

The words were flung out with a look intended for Tony. But Tony had retired as the door opened, and the look fell hot from the stormy blue eyes into Bodewin's cool gray ones, as he leaned a little forward from his seat on the bench. One look was enough. Babe retreated, banging the door behind her. Dad and Tony burst into loud laughter, Dad fairly shedding tears in his excess of mirth.

"Babe wilted then, for sure!" said Tony; and Dad, turning to Bodewin, who had remained perfectly grave, apologized for his daughter.

"Babe's always skeered of strangers; she don't mean nothin'. Here, you Tony, quit laughin' at your sister, and go take care of them critters!"

The two horses, which were at home, had strayed off towards the corral, while Baldy, observant of his master's movements, remained near the cabin. Tony walked leisurely towards him, and put out his hand to take his bridle-rein. Baldy jumped away a few feet. Tony stepped quickly after him and caught at the rein. Baldy whirled off and let fly at Tony with his heels. Bodewin smiled, and Dad looked interested.

"Stop your jumpin' and go to him quiet-like and speak to him," he suggested.

Tony replied with a scornful jerk of his head, and made another rush for Baldy's rein, calling, "Whoa, there!" Baldy swerved, reared, tossing his rein up in the air out of Tony's reach.

"That's right, Tony, cuss a little; may be that'll git him." Dad chuckled and Bodewin laughed outright.

"He can't catch that horse. He won't let any one catch him but me."

Tony heard Bodewin's remark.

"I'll bet, by ——, I can catch him!" he said.

Returning to the cabin, he took down a coiled lasso that hung within convenient reach by the door.

Dad and Bodewin watched him in silence as he adjusted the rope for a throw. Baldy had trotted off a little way. As Tony ran towards him swinging the rope above his head, the horse stopped and seemed to wait for the throw. The rope left Tony's hand, the loop widened, and Baldy, standing perfectly still, put his long white nose to the sod. The lasso settled down upon his neck and shoulders, and slid harmless to the ground. Baldy gave one quick jump sideways, then walked away, turning his sagacious eye backward towards his master.

"Lawd in the mornin'!" Dad exclaimed, smiting his knees with both hands, "but that horse has got sense! How'd you l'arn him not to leave no handle for the lass' to ketch on?"

Tony made another run for the horse and another throw, but again Baldy was as a graven image, with his nose and his fore feet touching the ground.

Bodewin now stood up and called him to him. Baldy came at the word and stood beside his master, with an imperturbable gravity and innocence in his white, eyelashed eyes. Bodewin waited, stroking Baldy's nose, until

Tony, panting and swearing, had drawn near. Then he said:

"Now I'll show you another little thing he can do," and giving Baldy's nose a shove with the palm of his hand he spoke the order, quick and sharp:

"Al corral! Anda! Ve-te!"

As Baldy sprang forward Bodewin struck him on the hip. The horse shot away down the slope from the cabin. Dad looked on contentedly, watching for the next manœuvre; but Tony, already suspicious, was now raging, sure that Bodewin had tricked them and that Baldy was off for camp. The horse was nearly a hundred yards away, going at full speed, when Tony fired at him between the tree-trunks once, and missed him; twice—he did not stop. A third shot would have been useless.

Tony turned to Bodewin, with his smoking pistol in his hand.

"That's your racket, is it? You've sent that horse to town."

Bodewin looked white and ugly.

"He'll just tell them I got your papers—that's all," he said.

"You oughtn't to 'a' fired, Tony," said Dad. "I believe you hit him. A bullet-hole won't look well onto him."

"I wish to —— I'd killed him! They'll be scourin' the whole country."

"You're mighty right." Then turning to Bodewin, Dad said: "Mr. Bodewin, you'll have to be kep' pretty clost for a few days."

"All right," Bodewin replied. "By the way, what am I to call you? You introduced yourself, but you didn't mention your name."

"My name—well—it's—Jim—Jim Keesner."

"Thank you, Mr. Keesner."

The door opened and Babe, still flustered, but shy-eyed and lofty, called them in to supper.

(To be continued.)

Mary Hallock Foote.

A SECOND THOUGHT.

IN the ancient days,
Arthur loved his queen;
Guinevere loved Arthur not,
Lost in love for Lancelot.

Love is passing sweet,
Men and maidens say;
But I trow that Guinevere
Seeking joy, found wild-eyed fear.

If, dear, one should think you
Somewhat cold and high,
This would be wise, to ponder well
That seeking fire one might find hell.

Florence Wilkinson.

THE CLOVERFIELDS CARRIAGE.

NOT far from the roadside, in one of the southern counties of Virginia, there stood a neat log-cabin, inhabited by a worthy negro couple, known as Uncle Elijah and Aunt Maria. These two had belonged to a widowlady, who owned the estate of Cloverfields, about three miles away; but when, a few years before the open-

ing of our story, the close of the civil war had set them free, they, in common with nearly all the negroes in the county, thought it incumbent upon them, as an assertion of their independence, to leave their former owners, and either work for themselves or go into service elsewhere. Thus there was a general shifting from plantation to plantation. Uncle Elijah and his wife, both now past middle age, left the place where they had been born and raised, and hired this cabin on a neighboring plantation, where by day's labor and odd jobs on the part of the husband, and washing and ironing and chicken-raising on the part of the wife, they managed to live in moderate comfort.

Elijah had been the family coachman, and he had found it a hard thing to resign the dignity of this position; but had he retained it he would virtually have admitted to all his brethren and sisters that freedom had done nothing for him. In order to show that he was now director of his own fortunes, it was necessary that he should drop the reins by which he had so skillfully directed and controlled the two black carriage-horses which had been his especial care since their early colthood.

But his love for his old mistress and his sense of his former dignity never left him, and now, when from afar he saw approaching the familiar carriage, he watch it until it had entirely disappeared from sight. Sometimes, if it were near enough, he would advance, hat in hand, to speak to his old mistress; but this he did not often do,—people might think he wanted to go back.

One autumn evening, just about dusk, as Uncle Elijah came out of his cabin, he perceived, near the top of a long hill on the road, the Cloverfields carriage and horses. Other eyes in the growing gloom might not have known what vehicle it was, but the eyes of Uncle Elijah could make no mistake. As he stood and gazed they sparkled with emotion.

"Whar Miss Jane gwine dis time o' night? An' wot's de matter wid dat kerridge!" he

ejaculated. "I'll be dangdiddled ef de eberlastin' fool dat's dribin' hain't gwine an' chain' up de hin' wheel as ef it was a hay-wagin. An' who's de no 'count idyit wot can't drike down Red Hill widout chainin' de wheel? Lor'! how he do bump de stones! An' how dat mus' rile Miss Jane! But I reckon she mus' done got use' ter bein' riled, a pickin' up all sorts o' niggahs to drike her kerridge."

When the vehicle reached the bottom of the hill, not far from the cabin, it stopped, and the driver got down to unchain the wheel. Possessed by a sudden thought, Uncle Elijah rushed into his house, from which his wife was happily absent, clapped on his hat, and seized his coat. Keeping well away from the road, he ran towards the carriage, climbed the fence, and approached the vehicle in the rear, where he would not be seen by any of its occupants. When he reached the man, who had just unfastened the chain, the soul of Uncle Elijah was filled with righteous indignation at finding it was Montague Braxton, a negro shoemaker of the neighborhood. Without a word he seized the cobbler coachman by the collar, including a good part of one ear in his grasp, and led him away from the carriage, Montague, who knew who had clutched him, submitting without a word. When they had hurriedly gone a dozen steps Elijah hissed in the other's ear:

"Is you comin' back ter-night?"

"Yaas," whispered the shoemaker, very much astonished at the manner of his interviewer.

"Well, den, jus' you go 'long up ter my house, split de wood fur Aun' M'riar, fotch a bucket ob water from de spring, and stay hyar till I come back. I'se gwine ter drike dis kerridge myse'f. Ain't got no time to say no mohr. Now, git!"

Montague, who knew "Uncle 'Lijah" as a pillar of strength in the church, as well as a pillar of not very easily restrained strength in his own proper person, made no answer, but noiselessly slipped away. Elijah passed quickly around the carriage, keeping at a little distance from it to avoid being recognized by those within, although he scarcely need have feared this in the increasing gloom, and mounted to the elevated seat in front; when, taking up the reins and whip, he started the horses, and the equipage moved on. Now sat Uncle Elijah like a king upon his throne, and his soul was moved within him with a joy that he had not known for years. Here were Gamma and Delta, the two horses that he had driven so long, a little older, a little browner in their manes and tails, but still the same good horses, with plenty of strength and spirit left; here was the same

old harness—he could recognize it even in the dark—badly kept, and badly put on, but still the same; here were the reins that once no hand but his had ever dared to touch; and here the whip, very old now and shabby, with a miserable new lash on it, but still the same whip he used to wield; and here was the high seat on which he alone had sat from the time he became a man in years until that day when his freedom made him another man.

Now the thoughts of the regenerated coachman ran riot in his brain. Indignation towards the shoemaker who had dared to drive the family carriage of his old mistress on a night which promised to be as dark as this, first took entire possession of him.

"Dat no 'count cobbler!" he said to himself. "Wot he know 'bout dribin? An' o' nights, too! An' wid de crick up. An' wid de water all ober de road 'longside for harf a mile. An' de road pas' Colonel Tom Gileses all washed so dat he couldn't help slidin' inter de gully to sabe his soul, ef he hadn't fus' druv inter de crick, an' tumbled de kerridge an' hosses, an' his own eberlastin' fool se'f, top o' Miss Jane, an' mos' likely little Miss Jane an' Miss Almira Gay. But dey's all right now I'se dribin'. You ken bet your life on dat."

If any one had heard this remark, he would have been quite safe in accepting the wager, for, by day or by night, washed by rains, covered by freshets, or in their normal condition, Uncle Elijah knew the roads in this neighborhood better than any man alive; ever since he had become a freeman he had studied the difficulties and obstructions of the highways as he walked to and from his work. "Ef I was a dribin' hyar" he would say to himself, "I'd put dis fron' wheel roun' dat little stone, den one small twis' ud bring de hin' wheel on dis side ob it, an' I'd clean miss de big rock in de udder rut."

Remembering and avoiding the stones, deep ruts, and encroaching gullies, Elijah, like a pilot who steers past the rocks and sandbars which lie under the water, as the road now lay in the darkness of the night, went steadily on, without bump or jolt of any account. Passing the flooded part of the road without deviating a foot to the right or left of the proper course, passing the tobacco field of Colonel Giles, where the rains had washed the road into a shelving hillside, without bumping an exposed rock or sliding towards a gully, he reached the higher and more level portion of the road, which was now so comparatively good and comparatively clear, to the sharp eyes of horses and driver, that Elijah went on at a fair pace, now and then waving his whip and straightening himself up as a

man who breathes his native air once more. Suddenly a dreadful thought flashed across his mind, and he barely checked himself from pulling the horses back on their haunches.

"Whar's I gwine?" said he, almost aloud. "Dat double, eberlastin' fool shoemaker neber tole me! Whar kin Miss Jane, an' mos' like little Miss Jane an' Miss Almira Gay, be gwine at dis time? An' comin' back ter-night, too! Dey mus' be 'tendin' ter spen' de ebenin' somewhar,—but whar?"

Elijah now revolved in his mind every place to which he thought the family might be going. So far he had made no mistake because there had been no turn in the road; and although he had passed the place of Colonel Tom Giles, they could not be going to see him, for he was an old bachelor, living alone, and besides had gone to Richmond. A short distance ahead the road branched, and in one direction led to the house of Dr. Marshall Gordon, distant about a mile, and in the other to the hospitable mansion of General William Tucker.

"Dey can't be gwine fur de doctor fur anybody sick," thought Elijah, "fur if it had been dat dey'd sent a boy on a hoss, an' not hitched up de kerridge wid a shoemaker ter drike; an' I'd be dreffel 'shamed ter take 'em more'n four miles to de Gin'ral's ef dey wasn't gwine dar."

The nearer he approached the fork of the road the more completely Uncle Elijah became convinced that he could not decide this important question for himself. It was absolutely necessary that he should get down and ask his old mistress where she was going. This was a terribly hard thing for him to do. He would be obliged to tell the whole story, and to admit that his affection for her, as strong as ever, had prompted him to take the driver's seat. And this was to relinquish a portion of his new freedom and manhood. But it had to be done, for the fork of the road was reached. Drawing up his horses, Elijah descended from his seat, and with the reins in one hand, for he was not a man, like the cobbler, to leave his horses standing free in the road, he reverently opened the carriage door.

"Miss Jane," said he, "I spec' you s'prised to see me dribin', but I couldn't stan' still an' let dat no 'count shoemaker, wot don' know nuffin 'bout hosses, nor de roads nuther, an' night comin' on pitch dark, drike you. He hadn't eben sense 'nuf to tell me whar you's gwine, so I begs you'll scuse me fur gittin' down ter ax you."

They were now in the heavily shaded portion of the road, and the interior of the carriage was quite dark. From the farthest corner of the back seat came a thin, low voice

which said to him: "Keep on now to the kyars."

This reply surprised Elijah in several ways. In the first place, he had confidently expected that his old mistress would say something expressive of her satisfaction in finding herself under his charge on such a dark night as this; and, again, he was surprised to hear that voice come out of the carriage. It did not belong to Miss Jane, nor, as far as he could judge, to any of her family. After a moment's hesitation he closed the door, and then, irresolutely, mounted to his seat and drove slowly on. He had not proceeded a hundred yards before there dawned upon his mind a dim recognition of the voice which had come from the carriage. Drawing up his horses again, he quickly got down and opened the carriage door.

"Who in dar, anyhow?" he said, in a tone by no means as respectful as that he had used before.

At this question the opposite door of the carriage suddenly opened, and the occupant popped out of it. As this individual, upon reaching the ground, turned, and stood facing Uncle Elijah, the latter could see, outlined upon a patch of sky behind him, the plainly discernible form of the cobbler, Montague, from whose lips now burst forth a roar of laughter that completely established his identity. The outraged soul of Uncle Elijah boiled and bubbled within him. He put out his left arm as if he would reach through the carriage and clutch the scoundrel by the throat. But this was impossible, and he would not drop the reins to run around the carriage.

"You eberlastin' fool cobbler!" he cried, "what fur you go play dis trick on me?"

"I no play no trick on you, Uncle 'Lijah," returned Montague, still laughing immoderately. "You played de trick on youse'f. I'se done nuffin but jus' keep out your way. I got up behin' so's ter see whar you was gwine, an' den I unhooked de back cuttins, an' slipped inside 'cause 'twas moh comf'ble."

"I'll break your neck fur dat!" cried Uncle Elijah. "A low-down, yaller shoemaker like you gittin' inter Miss Jane's kerridge!"

"Got ter ketch me fus', Uncle 'Lijah, 'fore you break my neck," replied the shoemaker, still in a merry mood.

"Shet up your fool talk," cried Elijah, "an' tell me whar you was sent ter."

"I was sent fur Miss Polly Brown, de seamstress wot libes on Colonel Tom Giles's place, but dat was a long time back. She done gone ter bed afore dis. Miss Jane tole me ter go arly in de ebenin, but somebody done took one ob de hoss coll'rs fur de plow team, an' I couldn't find it nowhar, so it got

right smart late afore I started. An' now you done tuck up so much time, Uncle 'Lijah, comin' way out hyar on your little business, dat 'tain't no use gwine fur Miss Polly Brown till de mawnin'. Whar *is* you gwine, anyhow, Uncle 'Lijah?"

To this Uncle Elijah made no answer, but his tone moderated a little as he asked: "Wot fur you tell me to keep on ter de kyars?"

"Cos I didn't know no udder place ter go, ef it was lef' ter me. 'Tain't fur ter de kyars now, an' dar's allus sumfin dar fur de fam'ly, an' I'd ruther go back an' tell Miss Jane dat I done mistook whar she tole me ter go dan ter say I ain't been nowhar."

Uncle Elijah's mind was not a quick one, but it did not take a very long time for it to dawn upon him that in this predicament it might be better to go somewhere than nowhere. His anger had cooled down somewhat, for he felt that in his controversy with Montague he had had the worst of it. After rubbing the side of his head for a few moments he said shortly to the cobbler, "Shet dat doh', an' come 'long ter de kyars. Ef dar's anyt'ing dar fur de fam'ly, you kin git it, an' I'll dribe back. Ain't gwine ter trus' you wid dese hosses in de night."

"Look hyar, Uncle 'Lijah," said Montague, coming round to the back of the carriage, but keeping well out of reach, "dar ain't gwine ter be no fightin' if I done git up 'longside o' you, is dar?"

"Come 'long hyar," said Uncle Elijah, mounting to his seat; "I ain't gwine ter fight while I got dese kerridge an' hosses under my chawge. But I don't say nuffin 'bout ter-morrer mawnin', min' dat."

"Don' keer nuffin 'bout mawnin', long as 'tain't come," said Montague, getting up on the other side.

The railroad station was a little beyond Dr. Marshall Gordon's, and the road to it was one over which Elijah had gone so often that he felt warranted to drive at a good round pace, especially since he knew that his old mistress would not be bumped if he happened to strike a stone. His recollection of his previous careful driving made him grumble all the more at the shoemaker for having brought him on such a tom-fool errand.

"Now look hyar, Uncle 'Lijah," said Montague, "did you eber hear de par'ble ob de fox an' de mule?"

"Don' 'member no sich par'ble," said Elijah. "Is it in de Scriptor?"

"I reckon so," said the shoemaker. "I neber read it dar myse'f, but I spec's it's from de Scriptor. Dar was a fox a-gwine ter de well fur a drink ob water, an' when he got dar he pull up de rope, an' sho' 'nuf dar wasn't no

bucket to it. Dar had been a baptizin' at a church not fur off, an' as de baptizin' pond was all dried up, some ob de bredren come ter de well ter git some water, an' when dey saw dat de bucket was a good big one, dey t'ought dey mought as well take it 'long to baptize de sister right in it, cos she was a little chile on'y free weeks old."

"Dey don' dip 'em dat young," interrupted Elijah.

"Dis was a long time ago," said Montague, "an' a Mefodis' baby at dat. An' when de fox foun' out de bucket was gone, he jus rar'd an' chawged, fur he was pow'ful firsty, habin' bin eatin' fur his breakfus' some ob dat dar mean middlin' dat dey sen's up from Richmon', wot is moh salt dan meat. But sw'arin' wouldn't fotch de water up ter him, an' so he 'cluded ter climb down de rope, an' git a drink dat way. When he got down dar he drunk, an' he drunk, an' he drunk, an' when he felt mos' like fit to bus' he thought he'd had enuf, an' he'd go up ag'in. But when dat ole fox try ter climb up de rope, he fin' it right smart dif'rent wuk from comin' down, an' he couldn't git up nohow. When he foun' dis out he was pow'ful disgruntled, fur he had to stan' in de water, an' it was mighty cole, an' he 'spected he'd git de rheumatiz, an' have to have his legs wrop up in red flannel an' turpentine. While he was 'volvin' in his min' wot he'd do to dat sto'-keeper wot sole him dat salt middlin', 'long come a' army mule an' look down de well. He was p'intedly ole, dat mule, an' branded wid U. S. twice on bof sides, what had been guv to a preacher at Pow'tan Court House by de guv'ment, in de place ob a good mule dat de Yankees took."

"Th'ain't no mention of Pow'tan Court House in de Scriptor," interrupted Elijah.

"Don' know 'bout dat," said Montague; "I reckon it's a Scriptor name. Anyhow, de army mule he poke he head down de well, an' holler: 'Hello! Whar de bucket? an' who down dar?' 'Mawnin', Cap'n Mule,' said de fox. He was one ob dem red foxes dat been hunt so offen by Gin'ral Tucker's pack of hounds dat it make him pow'ful peart. 'De bucket no 'count, Cap'n. De bottom's bruck out, an' it's been throwed away. Ebrybody comes down de well arfter de water, an' I jus' tell you, Cap'n, it's mighty good dis mawnin'. Somebody mus' 'a' drop' a tickler an' a couple ob pounds ob sugar down hyar, fur it tastes jus' like apple toddy.' An' de fox he 'gan to lap wid he tongue as ef he could neber git enuf. When de army mule he heard 'bout de apple toddy, he say no moh, but jus' slid down de rope. 'Hello!' he holler when he git to de bottom. 'How you put your head down to drink? Th'ain't no room fur me to put my

head down.' 'Dat's so,' said de fox, who was scrouging ag'in' de wall to git out ob de way; 'you do fill up dis well 'mazin', an', sho' 'nuf, dar ain't no room fur you ter put your head down. But neber you min'. Jus' stan' still, an' I'll fix all dat.' De army mule, his hind legs was in de bottom ob de well, his fore legs was ag'in' de sides, an' he great long neck was stickin' eber so high up. Him gittin' right smart skeered 'bout dis time. De fox he jus' jump on de mule back, den on he neck, den on he head, an' den he gib one skip right out ob de well. 'Hello, dar!' hollered de mule. 'Whar you gwine? Come back hyar, an' haul me out dis well! What fur you go 'way an' leab me hyar?' De fox he come back, an' he look down de well, an' he say: 'Wot's de matter, mule?' An' de heart ob de mule went down into his hoofs when he notus he done lef' off de cap'n. 'I got nuffin' ter do wid dat well, nur wid you nudder. Ef you wan' ter go down arfter apple toddy, dat's your look-out. Good-mawnin'.' An' off went Mr. Fox to de stoh' po'ch to tell de folks 'bout dat fool mule.

"Now dat par'ble 'minds me ob you, Uncle 'Lijah. You didn't hab to git up on dis seat, an' hol' dese reins, an' drike dese hosses, ef you hadn't wanted ter. 'Tain't no use jawin' me fur dat."

"Ef I wasn't 'feared dese hosses ud run away," roared Uncle Elijah, "I'd jus' take you down de road and gib you sech a-hidin' as you haven't had sence you got inter breeches."

With Uncle Elijah's hands so fully occupied as they were, Montague felt safe; and, edging as near as possible to his end of the seat, he exclaimed:

"But dat ain't all de par'ble, Uncle 'Lijah. De fox he come back dat ebenin', an' when he look down de well, dar de mule yit, sw'arin' an' cussin' like all out-doh's. When he see de fox, de mule he 'clar ter gracious dat when he git out he kick dat fox inter little bits so small dat dey could sow him ober de fiel's from a wheat-seeder. 'Look hyar,' said de fox, 'you min' me ob de par'ble ob de man what los' his spring lamb. Somebody stole that lamb wot he 'spected to get foh' dollars fur at de Court House, an' de man he rared an' chawged, an' he swore dat ef he kotch dat thief he'd lick him wuss dan any sheep-thief was eber licked in dat county, or any ob de j'ining counties. He hunted high, an' he hunted low, to find de thief, an' jus' as he got inside de woods he come across a great big b'ar who had his spring lamb a hung up a-barbecuin', an' he was a-nailin' de skin up ag'in' a tree fur ter dry. De man was orful skeered; but de b'ar he sees him, an' he sings out: 'Hello! man,

now you kotch de t'ief wot stole your spring lamb, why you no punch he head? Why you no break he back wid dat club? Tell me dat, you big man!' An' de b'ar he put down he hammer an' he nails so's ter talk de better. De man he too skeered to speak a word, an' he kep' squeezin' back, an' squeezin' back, widout sayin' nuffin. De b'ar he come nigher an' nigher, an' he sing out: 'Wot fur you keep your mouf shut like a can o' temahters? Why you no do some ob dem big t'ings you blow 'bout jus' now?' De man he squeeze back, an' he squeeze back, till he git ter de edge ob de woods, and den he sing out: 'I mube dis meetin' 'journ'! An' he more'n 'journed.

"Now, Uncle 'Lijah, I don' wan' ter make no 'flections 'gin' you in dis par'ble, but de fox he did say ter de mule dat 'fore he blow 'bout de big t'ings he gwine ter do, he better 'mune wid his own soul, an' see ef he able. Right smart fox dat, min' you, Uncle 'Lijah."

To this Uncle Elijah made no answer, but his eyes sparkled, and his big hands were gripped very tightly on the whip and the reins that he held; and in a minute more he had drawn up at the little railroad station. Montague got down, and went to inquire if there were any packages of goods waiting for the Cloverfields family, while Elijah remained in his seat. This was a very familiar spot to the old negro. In former times he had been in the habit of driving here two or three times a week, and as he sat on his old seat on the carriage, with the same old reins in his hand, and the two black horses of the olden time again before him, and the familiar scenes all about him, Elijah actually forgot for the time being that he had ever resigned his ancient post.

"Look hyar," said Montague, presently returning with a package in his hands. "Hyar's some dry-goods from Richmon', an' ef we hadn't druv down hyar, I'd been sent arfter 'em ter-morrer in de cart or on mule-back. De train's comin' in ten minutes; might as well wait, an' see ef dar's anythin' moh."

Elijah grumbled a little at waiting, but Montague, whose soul delighted in being stirred, even by so small a matter as the arrival of a railroad train, insisted that it would be unwise to go away, when a few minutes' delay might save a lot of future trouble. And so they waited.

Soon there was heard a distant whistle, then an approaching rumble, and the train rolled up to the station and stopped. As she had always done, Gamma tossed her head and looked to one side, while Delta pricked up his ears; but, as he had always done, Uncle Elijah kept a firm hand upon the reins,

and spoke to his horses in a low, quiet tone, which had the effect of making them understand that they might safely remain where they were, for under no circumstances would the train come their way.

Out of the open window of a car a young man put his head, and looked up and down the narrow platform, and then his eye was caught by the Cloverfields carriage, standing full in the light of the station lamp. Drawing in his head, he continued to look steadily at the carriage, and then he arose and came out on the car platform. One of the good comfortable stops, not unfrequent on the roads in this part of the country, was taking place, and the conductor had gone into the station to send a telegram. The young man came down to the bottom step, and again looked up and down. Here he was espied by Montague, who rushed up and accosted him.

"How d'ye, Mahs Chawles? Don' you 'member me? I'se Montague Braxton. Use' ter men' your boots."

"Isn't that Uncle Elijah?" asked the young man. "And who is the carriage waiting for?"

"Come fur you, sah," said the mendacious cobbler. "All ready waitin', sah. Gimme your checks, Mahs Chawles, an' I'll git de baggage."

"Come for me!" repeated the young man. "How did they know?"

"Cawn't tell nuffin 'bout dat, sah, but Miss Jane she sen' me an' 'Lijah arfter you wid de kerridge. Better hurry up wid de checks, sah."

The young man stood upon the bottom step looking steadily at the carriage, and paying no attention to Montague's last remark. Then he moved his eyes and saw the conductor coming out of the station. He turned, sprang up the steps and into the car, returning almost instantly with a valise and a light overcoat, which were immediately taken by the obsequious Montague.

"Dat all, sah?" said he.

The young man nodded. "All aboard!" cried the conductor. And in a moment the train had moved away.

Montague put the coat and valise on the front seat of the carriage, and stood holding open the door. "Hyar Mahs Chawles," said he to Elijah.

The old man turned so suddenly as to startle the horses. "Mahs Chawles!" he exclaimed, his eyes opening like a pair of head-lights.

"How d'ye, Uncle Elijah?" said the young man, extending his hand, which the old negro took as if he had been in a dream.

Montague looked a little anxiously at the two. "Better hurry up, sah," he said in a low voice. "It's gittin' late, an' Miss Jane's awful skeery 'bout dribin' at night."

At this the young man entered the carriage, Montague shut the door and ran around to his seat, and Uncle Elijah, his mind dazed and confused by this series of backward slides into times gone by, turned his horses and drove away. For ten minutes he spoke not a word, and then he said to Montague: "Did you know Mahs Chawles was comin'?"

"Ob course I did," said the cobbler. "You don's'pose, Uncle 'Lijah, dat I'd fotch you all de way down hyar jus' fur a little bun'le ob cotton cloth? Didn't say nuffin 'bout Mahs Chawles, cos I feared he mightn't come, an' you'd be dis'p'inted, an' dem par'bles was jus'ter pahs de time, Uncle Lijah — jus' ter pahs de time."

The old man made no answer, but drove steadily on, and the moon now having arisen, he was able to make very good time. Little more was said until they had nearly reached Uncle Elijah's cabin; then Montague asked the old man if he intended driving all the way to Cloverfields.

"Ob course I do," was the gruff reply. "You don' s'pose I'd trus' you wid Mahs Chawles dis time o' night?"

"Well, den," said the other, "I reckon I'll git down and cut acrost de fiel's ter my house ef you'll be 'bligin' enuf, Uncle 'Lijah, jus' ter put up de hosses when you gits dar, an' I'll come fus' t'ing in de mawnin an' 'tend to ebery'ting, jus' as I allus does."

"Go 'long," said Elijah, slackening his horses' pace. "I'se got no use fur you, nohow."

The mistress of Cloverfields, with little Miss Jane and Miss Almira Gay, was sitting in the parlor of the old mansion very much disturbed. In the middle of the afternoon Montague Braxton had been told to take the carriage and go for Miss Polly Brown, the seamstress, who had promised to give a week of her valuable time to Cloverfields; but, although it was now between nine and ten o'clock, he had not returned. The force of men-servants at Cloverfields was very small, and no one of them lived at the house excepting a very old man, too decrepit to send out to look up a lost cobbler and a carriage; and "Miss Jane," who was still a vigorous woman, though her hair was white, with her daughter, little Miss Jane, and her niece, Miss Almira Gay, had almost determined that they would walk over to a cabin about half a mile distant, and get a colored man living there to saddle a mule and ride to Miss Polly Brown's to see what had happened, when their deliberations were cut short by the sound of carriage-wheels on the drive. The three ladies sprang to their feet and hurried out to the porch, throwing the front door wide open that the light from the hall lamp might illuminate the steps.

"Why, Miss Polly!" exclaimed little Miss

Jane, what on earth——” And then she abruptly stopped, ejaculating in a low tone: “Uncle Elijah!”

At these words her mother moved quickly forward to the edge of the porch, but before she had time to say anything the carriage-door opened, and there stepped out, not the middle-aged seamstress who was expected, but a young man, on whose pale and upturned face the light of the hall lamp shone full. There was a cry from the women, a sudden bound up the steps, and in an instant the son of the house was in his mother's arms, with his sister clasping as much of his neck as she could reach.

A quarter of an hour after this, as Master Charles sat in the parlor, his mother on one side with an arm around him, his sister on the other side with her arm around him, while his right hand clasped that of Miss Almira Gay, he thus explained himself: “I hadn't the least idea of getting off the train, for you know I had vowed never to come here till there was an end of that old trouble; but I thought if I went down to Danville in the late train we probably wouldn't stop at our station at all, and that I wouldn't notice when we passed it. But we did stop, and I couldn't help looking out, and when I saw the Cloverfields carriage standing there just as natural as life, and old Uncle Elijah in the driver's seat——”

“Uncle Elijah!” exclaimed his mother, pushing back her chair. “Did he go down to the station to bring me my son?”

“It was Elijah!” cried little Miss Jane. “I saw him on the seat.”

The old lady arose and left the room. She stepped upon the porch and looked out, but the carriage had gone. Then she went to the back door, hastily lighted a lantern which stood on the table, and with this in her hand made her way under the tall oaks and along the driveway to the barn, which was at some distance from the house. Through the open door of the stables she saw dimly the form of a man engaged in rubbing down a horse. Raising the lantern in her hand, she stepped to the door and threw the light within.

“Uncle Elijah,” she said, “is that you?”

The man turned around. He forgot he had a vote; he forgot he could serve on a jury. He simply took off his hat, and coming forward, said: “Yaas, Miss Jane, dis is me.”

The next morning, not very early, the cobbler approached the Cloverfields stables to attend to the horses, and to do the various oddments and bitments of work for which he had been temporarily hired. To his surprise, just as he turned a corner of the barn he met Uncle Elijah, who was engaged in attaching a new lash to the carriage-whip. Montague, astounded, stood for a moment speechless,

gazing at Elijah, who, in some way, seemed to be different from what he was the day before. He looked taller and wider; his countenance was bright, his general aspect cheerful, and an element of Sunday seemed to have been infused into his clothes.

“Didn't spec to see you hyar, Uncle'Lijah,” stammered the cobbler when he found his voice.

“Reckin not,” said the old man, “but I'se glad ter see you, cos I wants ter tell you a par'ble. Dar was once a mud-turkle, de low-downest, or'nerest, no 'countest mud-turkle in de whole worl'. His back was so cracked dat it wouldn't keep de rain off he skin, and he bottom shell bin ha'f sole' free or four times; he so lazy he ruther scuffle it ober de rocks dan walk; an' de chickens had eat off he tail afore de war, cos he too triflin' ter pull it in. Well, dis mis'ble mud-turkle come 'long one day, an' he sees a Chris'mus tukkey a-settin' on de limb ob a big apple-tree. De tukkey, he feel fus'-rate, an' he look fus'-rate, an' he jyin hese'f up dar 'mong de leabas an' de apples. An' de mud-turkle he look up, an' he say: ‘Dat mighty nice up dar! Reckin I'd like ter set up dar myse'f. Jus' you come down, Mahs Chris'mus tukkey, an' lemme set up dar 'mongst de apples an' de leabas.’ Den de Chris'mus tukkey, he bristle hese'f up, an' he stick out he feathers, an' he spread out he tail, an' his comb an' his gills git redder dan fire, an' he sing out: ‘Go 'long wid you, you mud-turkle; don' lemme heah you say no moh 'bout settin' up hyar.’ You dunno how to drike a hoss; you got no moh sense dan ter chain de hin' wheel ob a kerridge, gwine down Red Hill; you lose de hoss-collus; you breaks de whip-lashes, and gits de harness all upside down wrong; an' you comes ter feed de hosses arfer dey's bin watered an' turned out moh'n two hours. P'raps you dunno who I is. Ise de driber ob de Cloverfields kerridge, an' as long as I has de use ob my j'int, an' can see wid my eyes, nobody drikes dat kerridge but me. An' now, look hyar, you shoemaker mud-turkle, when me, an' Miss Jane, an' little Miss Jane, an' Miss Almira Gay, an' p'raps Mahs Chawles, gits ter de Happy Lan', don' you reckon dat you's gwine ter come dar too cos your foolin' helped fotch Mahs Chawles home. De angel Gabr'el, he p'int his horn right at you an' he sing out: ‘Ain't got no use fur no yaller cobbler angels hyar, wid dey fool par'bles, an' dey lies 'bout bein' sent fur Mahs Chawles, an' dey lettin' Aun' M'riar split her own wood an' fotch her own water from de spring.’ An' now you's got my par'ble, Montague Braxton, an' de nex time you comes you gits your lickin'.”

THE SONG HE NEVER WROTE.

HIS thoughts were song, his life was singing;
Men's hearts like harps he held and smote,
But in his heart went ever ringing,
 Ringing, the song he never wrote.

Hovering, pausing, luring, fleeting,
 A farther blue, a brighter mote,
The vanished sound of swift winds meeting,
 The opal swept beneath the boat.

A gleam of wings forever flaming,
 Never folded in nest or cote,
Secrets of joy, past name or naming,
 Measures of bliss past dole or rote :

Echoes of music, always flying,
 Always echo, never the note ;
Pulses of life, past life, past dying,—
 All these in the song he never wrote.

Dead at last, and the people, weeping,
 Turned from his grave with wringing hands,—
"What shall we do, now he lies sleeping,
 His sweet song silent in our lands ?

Just as his voice grew clearer, stronger,"—
 This was the thought that keenest smote,—
"O Death! couldst thou not spare him longer?
 Alas for the songs he never wrote!"

Free at last, and his soul up-soaring,
 Planets and skies beneath his feet,
Wonder and rapture all out-pouring,
 Eternity how simple, sweet!

Sorrow slain, and every regretting,
 Love and Love's labors left the same,
Weariness over, suns without setting,
 Motion like thought on wings of flame:

Higher the singer rose and higher,
 Heavens, in spaces, sank like bars ;
Great joy within him glowed like fire,
 He tossed his arms among the stars,—

"This is the life, past life, past dying;
 I am I, and I live the life :
Shame on the thought of mortal crying!
 Shame on its petty toil and strife!

Why did I halt, and weakly tremble!"—
 Even in Heaven, the mem'ry smote,—
"Fool to be dumb, and to dissemble!
 Alas for the song I never wrote!"

THE LESSON OF GREEK ART.

PART II. THE EDUCATION OF THE ARTIST.

IF the artistic education of the people is furthered in school by the immediate teaching of art history, as well as by the modification of the general spirit of school-teaching, and, after school, by the encouragement and active development of intellectual pleasures among the public, as well as by the direct encouragement of art by the public administration, then the first condition which made art with the Greeks what it was, a language intelligible to the mass of the population, may be realized in this country. But if art be made thus generally intelligible to the people, we must also add to it the second characteristic — that it be adequately expressive of the highest and best in our age; and this can only be attained by the education of the art-producing few. However much may be done by the actual demand for great works on the part of the public, great art requires great artists.

The reason why our art is not adequately expressive of the best that is in our age is that the artist is not representative of the highest culture of our age. In Greece this was not the case. An artist like Pheidias was not only thoroughly skilled in all the technicalities of his art, not only did he study under different teachers, such as Hegias the Athenian and Polykleitos the Argive, but, above all, he was alive to and interested in all that moved his time; a friend of Pericles and Anaxagoras the philosopher, he responded to the political and scientific life of his time, and, as is shown by his familiarity with the Homeric poems, was well versed in the ancient and contemporary literature of his age. His position under Pericles was not only that of a sculptor, but he was what we should call a minister of public works, and in this time of great artistic activity he must have been in constant official relation with his cultured political friend, so close that he was made the butt of the political intrigues against Pericles. To live thus in close intimacy with the great political leader of the time, himself the center of all cultured interest, and above all to have been a free-born Greek boy with the universal education given then, made of this genius in art a most perfect representative of the best culture of his age, expressing himself in the language of art, as Pericles was such a type and expressed himself in poetical action and oratory, Æschylos in tragic poetry, and subsequently Plato in philosophy. The same has been ever the case in

the periods of the highest art. The versatile renaissance types of Leonardo da Vinci and Michael Angelo are known to all. The position of the latter has many analogies to that of Pheidias. The great artists of the flower of the renaissance were all full representatives of their age in their personalities; they were the peers in culture of the leaders in politics, in literature, and in science, nay, often took an active part in these collateral spheres. This is far from being the case in modern times; the artist is not thus a coordinate representative of the highest culture of our times. Nay, I make bold to say, that if we were to take an equal number of literary men, scientific men, physicians and other professional men, cultivated business men, and artists, the artists would rank lowest on the scale of general culture apart from their special vocation. It arises from the deficient education of the generality of our artists. When once a boy has manifested his talent, and it is decided that he should follow art as a profession, immediately after he has left school, or frequently before this period, he begins his artistic training to the exclusion of all other pursuits. How is it possible for one thus prepared to acquire or retain his position on the height of contemporary culture? No doubt ours is a time of great specialization, I might almost say unfortunately, if it had not such splendid results to show. Though in scientific and professional pursuits a certain amount of specialization is absolutely essential to the production of great work, the two exceptions to this rule are literature and art. The special subject here dealt with is general life. "Greift nur hinein in's volle Menschenleben, und wo ihr's packt da ist es interessant," is the advice given in Goethe's "Faust" to the poet. The artist chooses from life and nature, and he must appreciate and know them in all their aspects. And, what is still more important in these two spheres of intellectual activity, the man gives himself in his work; his personality is of a supreme importance in modifying or giving character to his work, not to be found in the pursuit of science or professions dealing more with things and their relations independent of the personality of him who treats of them. It is the subjective character of art-production, in contradistinction to the objective spirit of scientific work, which makes it less possible for the artist to specialize. The artist gives himself in his work, and therefore depends upon the constitution of this self whether the work will

be great or not. But if the personalities of the artists are not representative of the best in our age, it is hopeless to expect a really representative great art.

The practical question then presents itself to us: How can this deficiency in the education of the artist be remedied? The first demand is that the artists should partake of the higher education; they should have a university education as well as the literary men, the men of science and professions. The potential artist at school, the boy in whom the desire towards artistic production is expressed, and the capacities are manifest, should not at once neglect his general education. On the other hand, I am fully alive to the exceeding importance of familiarizing the artist from the earliest age with the technical language which he is to use. It is so in painting and sculpture, as it is so in music. The use of the brush and of colors and the handling of clay ought in the early years to be made so much a part of the boy or girl, that the process of applying them ought to be almost unconscious, an act of second nature; so that he shall hardly know why he uses his brush in this or that manner, takes a certain quantity of one color and not of another; as little as the violinist knows why he uses a certain degree of wrist-pressure in bowing a certain passage, or the pianist considers each note he plays. But because it is advisable to train the future artist from an early period in the technicalities of his art, there is no reason why his general education should therefore be stunted and he should neglect his other studies at school. The two things can be combined, and the amount of practice which is required to familiarize the boy at school with the technicalities of art, so far as it is required at this age, is gained with but slight intrusion upon his leisure.

But it is after school that the critical period comes. It is now that those feelings and thoughts are to take form which are to mark the character of his compositions; and it is generally then that the art-student leaves school and, either abroad or at home, begins his work at the academy or at some studio. If he is industrious, he will work much; if not, he will spend much of his time in idle dreaming or in stupid dissipation, which a certain unreasoning and vicious tradition has established as being conducive to the growth of an artistic imagination. In either case the care for the further growth of general intelligence and taste has ceased with this age, and he necessarily falls behind the ranks in general culture. It is out of the question that every art-student should defer the period of his active apprenticeship to the completion of the university course. It is true, also, that at

some art-schools, such as the Beaux-Arts at Paris, the Munich and Berlin Academies, there are also lectures on subjects kindred to art. But this is not what is required; general education cannot be clipped and modeled to suit a special vocation.

The practical solution of the difficulty is, that there should be established an inner relation between the university and the art-academy with a view to the education of the art-student. Most great centers of artistic education have universities. Facilities ought to be granted to the art-student to attend the lectures of university professors, and the attendance on these lectures would act as a relaxation from the special work which he follows. Nobody will maintain that to hear a great representative of philosophy, of physics, of biology, or of history giving in an hour's discourse the fruits of his life-work, is not a great pleasure to a person possessed of higher intellectual instincts. If this does not give him pleasure, then there is something fundamentally coarse and wrong in his nature, which will manifest itself in all his productions. I do not wish to restrict this education to the subjects bearing upon art, such as, especially, the historical sciences. It is not the artist as such who is to be taught in these lectures, it is the man who is to receive the higher culture of his age. Nobody is truly representative of our culture who is not conversant with the great advancement of natural science. Now, I know many business men who delight in reading works of natural science, and who, without pretending to special knowledge in this sphere, are thoroughly alive to all that moves the scientific world; the instances of artists thus interested are very few. I would not have it understood that I wish to make the artist learned; still less that he is to apply the fruits of this higher education directly to his art. This is often the case when the education is but half acquired; we then see futile attempts to paint "scientifically," to give long quotations from obscure authors and works, to paint with a "realistic purpose," and all the other mental aberrations, as frequent in literature as they are in art. The undue obtrusion of any element in work or behavior always points to immaturity and to the fact that the element obtruded is but newly and, therefore, but half acquired. The artist who has lived through the great mental life of modern scientific investigation need not paint biological or physical pictures, or theorize on the relation of colors; but the tree, the scene of nature or history which he paints will be different in so far as his whole personality has undergone a change since he has assimilated a new sphere of knowledge. The same scene painted by sev-

eral artists differs in each case, because the artists differ in their way of looking at the scene as their whole character and intellect differ. Widen and ennoble a mind, and you will alter its whole character. If the artist is a full representative of the highest in his age, there is some chance of his work partaking of this high standard, provided his technical training and natural talent give him the completeness of artistic expression; but if he is below the highest standard of culture in his age, no amount of technical skill and talent will make his work truly representative of his age.

But, as in the education of the public we noticed the importance of the education in the life succeeding the school and university years, so here there is an education which comes after the art-academy, and which, it appears to me, is again neglected in the case of the artist. This is the educational side of social life. If most men were asked how much they had learned at school and university and how much in social intercourse with intellectual people, it would be difficult to give too high a limit to the latter. But it appears to me that artists are more exempt from this healthy friction than the representatives of almost any other liberal vocation. They are more exclusive or more clannish than any other class. They associate chiefly with one another, or with professedly art-appreciating people whose conversation, if not unintellectual, is generally "shoppy"; and thus, as a rule, even in after life the healthy interchange of interests and experience does not take place. Furthermore, there is often a depressing and intimidating atmosphere in a circle exclusively made up of workers in one field, which robs especially the young striver of the freshness and fearlessness of creative impulse. He leaves the society of his colleagues an intellectual coward, haunted by the critical eyes of his older fellow-workers,—a coward as regards great enterprise, he who before was a hero. How many an intellect has been stunted in growth and how much that was original planed down to the level of commonplace through the sway of shop-circles. After a good day's work in his studio the artist ought to seek the society of those in no way connected with art, where he can learn what moves the superior mind in other spheres of thought and action, and where he can keep alive his general interests developed by a sound education. What is wanted all over the civilized world is the *salon* of old days, the intellectual exchange with a thoroughly pleasant social tone. It does not exist in Paris, nor in London; though a few years ago the Sunday afternoons of George Henry Lewes and his wife very nearly held this position.

At all events, we shall not have the highest

art until our most skilled artists are also the most thoroughly cultured men. May the beginning be made in this country. We are at the first stage, and therefore possessed of greater organs and power of beginning anew; but, also, there are here possibilities of going wrong.

When the conditions favorable to the production of a great art in this country are realized so far as the education of the art-appreciating public and the productive artist are concerned, an important practical question presents itself in the form: What direction is artistic work in this country to take? For there are presented to the artist beginning his career many modes of conception and execution characterizing the European schools, definite lines of work already existing which he cannot ignore. These will necessarily influence him, and will present themselves for acceptance. As a matter of fact, it appears to me that the chief influence upon the art of America is exercised by the art of France. The greater number of our distinguished artists have gone to France for their training, and it is but natural, in this occupation as in all others, that the pupil should be an enthusiastic admirer of the methods followed in the school in which he has been trained. The greater and stronger the enthusiasm, the more will it be exclusive, and the more absolute will be the adhesion to the school. Furthermore, with the freshness which characterizes us, every movement is in danger of partaking of a "rage" or "craze," which always implies the exaggeration and exclusiveness of ill-balanced admiration. It appears to me that there is at this moment an unhealthy predominance of the French element in our art. It is unhealthy, inasmuch as it goes beyond the admiration of the qualities and aims at the complete introduction of the national characteristics of this foreign art,—not merely admitting its wholesome influence, but degenerating into imitation. The complete acceptance of alien models in art or literature is always unhealthy; inasmuch as it is untrue, it is singularly so in our country. There is one characteristic in which it is well for every country to imitate France: that is, the honesty and "professionality," if I may invent such a word, of its work. Despite the proverbial levity of character of the French people, I would venture to say that there is no country in which the thorough realization of technical work, as distinguished from play, in literature and art, is more completely felt and acted upon than in France. The author and the artist learn from the very beginning that there is a labor-side to the inspired, *feu-sacré* ebullition of poetry and art, and their work bears the traces of this thorough mastery of the

technicalities of their art-craft, be it in a novel, an essay, a drama, a picture, or a statue. They are thus comparatively free from the amateur productions which abound even in the professional publications and exhibitions of this country and of England. The line between the amateur and professional is definitely drawn, and the professional author or artist never forgets the craftsman who lives or ought to live in the artist. But to attempt adopting or imitating the spirit and idiosyncrasies of their art is as absurd as it is vicious and futile. Moreover, it generally leads to the feeble reproduction of what is eccentric in their art, and sometimes even of what is condemnable, while the true spirit and character is lost. Is it not better to be good Americans than feeble Frenchmen?

This is not the direction the American art of the future ought to take. It ought to be neither French nor English nor German—it is to be American. We are to be ourselves, truly ourselves, expressing what is in us with the greatest truthfulness, the most patient and conscientious labor. But the question may be raised: What are we? Is there anything definite to express, especially on the artistic side of our nature? I believe it is an opinion of American character long ago exploded in the minds of those who know us, that we are at heart a materialistic people. If anything, we are inclined to be artistic, and though not *learned* in art, we have the true instinct of artistic production; namely, the freshness of inventive power, and the delight of self-expression. We naturally lack confidence in our own power as regards intellectual products, and it is but right that at this early stage we should be diffident; but when we have gained the recognition of our older European kin this confidence will come.

To recognize what manner of men we are, what our failings and advantages, in order that we may strive at thus expressing ourselves fully and truly, we do well in turning to the past of Greece and in studying the history of a people abounding in the most curious and interesting analogies to our own. It is the history of the Greek settlements in the south of Italy and Sicily. They were, as we are, originally colonies from the mother-country, and carried with them the traditions and culture of an old country. They grew in power, wealth, and refinement as we are growing. It is an historical absurdity to make an hypothesis on what might have been if things had not happened as they did. Still I venture to follow up the idea that, had the Greek colonies of Magna Græcia joined in a great federation instead of making war upon one another and consuming among each other their great inner vitality, the course of the world's history might have been essentially altered and the

continuity of the highest Greek culture might have been greater than it has been. I have on another occasion, from a more special point of view, drawn attention to the fact that the reactive influence of the culture of these countries upon the culture of Greece proper has not been sufficiently recognized, and that this influence can hardly be over-estimated. It was here that the great philosophers were born, here that they endeavored to realize their ideas of social and political reform; not only Pythagoras and Parmenides, but also Plato. It was here that art freed itself from conventional shackles, here that the great games, so important in their influence upon the unity of Greece, received their chief patronage and encouragement. It was the theater of reforms, the trial-ground for new movements. They, as we, maintained the love and reverence for their parent homes; they were possessed, as we are, with the strong desire to vie with the Old World; and they felt the same joy if one of their citizens was victor in the Olympian games that we feel when one of our countrymen has been victorious in a European contest.

But it is in their art that their example is most instructive. Their great artists, such as Pythagoras of Rhegium, took their training at home and in the old country; but not only in one school, at Athens or Sparta: they laid themselves open to the influence of all. The result was freedom from the traditional shackles and thorough sympathy with their perfections; and this gave Pythagoras the power to be the great innovator in the free rendering of the human figure. The works coming from this country, works perfect in conception and execution, are thoroughly Hellenic in character, but cannot be classed under any one school; nor are they made up of the several parts. They have a new national character of their own, and one that would have grown in perfection had their own nationality grown to full constitution and lasting unity.

We, the Magna Græcians of the West, let us lay ourselves open to all that is good and great in the cultured life of the Old World. Let us learn from France, Germany, and England, and imbibe it all with unprejudiced desire of learning; but let us then express our own selves with truth and without affectation and with honest work, and let the character which will be in our work be *sui generis* and of a good kind. We have passed beyond the danger which engulfed the great cities of southern Italy and Sicily, we have put by inner dissension, and have reaffirmed a unity which will grow with the power of each organ of the whole body, with the spread of wealth, spiritual and natural.

We have also had our reactive influence

upon the culture of the Old World, and we are and have been the trial-ground for great reforms and new movements. We have taught the world the lesson of freedom and self-government. We are at present preaching to Europe the downfall of Talleyrandism and of "foreign" diplomatic policy. We are most effectually teaching them by economical competition the absurdity and economical impossibility of large standing armies, the childish outcome of their antiquated romantic policy of aggression and gold-laced, order-bedecked, Vienna-Conference prestige. We are positively teaching the lesson of the supreme importance of the Home Office, so to speak, and all its vital social and economical questions, over the Foreign Office with its stagey glitter and Quixotic pomp and mystery. We are teaching them lessons more effectually than the French phi-

losophers of nature and of nature's right, more effectually than the blood-lesson of the French Revolution, than the enthusiastic and thoughtful writers of the German *Aufklärung*. Let us finally teach the world the great lesson that it is the supreme duty of the state to foster and develop all that leads to the civilizing amusement and the intellectual edification of the people.

I FEAR that I have criticised much and have given much advice, more than my experience or years justify: I have been sententious and dogmatic. My only apology must be that the lesson I have attempted to give to my countrymen is not one of my own devising, but that it is the lesson of Greek Art of which I have been the feeble interpreter.

Charles Waldstein.

CANADA.

O CHILD of nations, giant-limbed,
Who stand'st amid the nations now
Unheeded, unadored, unhymned,
With unanointed brow!

How long the ignoble sloth, how long
The trust in greatness not thine own?
Surely the lion's brood is strong
To front the world alone!

How long the indolence, ere thou dare
Achieve thy destiny, seize thy fame,—
Ere our proud eyes behold thee bear
A nation's franchise, nation's name?

The Saxon force, the Celtic fire,
These are thy manhood's heritage!
Why rest with babes and slaves? Seek higher
The place of race and age!

I see to every wind unfurled
The flag that bears the maple-wreath;
Thy swift keels furrow round the world
Its blood-red folds beneath;—

Thy swift keels cleave the farthest seas;
Thy white sails swell with alien gales;
To stream on each remotest breeze,
The black smoke of thy pipes exhales.

O Falterer! let thy past convince
Thy future,—all the growth, the gain,
The fame since Cartier knew thee, since
Thy shores beheld Champlain!

Montcalm and Wolfe! Wolfe and Montcalm!
Quebec, thy storied citadel,
Attest in burning song and psalm
How here thy heroes fell!

O thou that bor'st the battle's brunt
At Queenston and at Lundy's Lane,—
On whose scant ranks but iron front
The battle broke in vain,—

Whose was the danger, whose the day,
From whose triumphant throats the cheers,
At Chrysler's Farm, at Chateaugay,
Storming like clarion-bursts our ears?

On soft Pacific slopes—beside
Strange floods that northward rave and fall—
Where chafes Acadia's chainless tide—
Thy sons await thy call!

They wait; but some in exile, some
With strangers housed, in stranger lands;
And some Canadian lips are dumb
Beneath Egyptian sands!

O mystic Nile! thy secret yields
Before us; thy most ancient dreams
Are mixed with far Canadian fields
And murmur of Canadian streams.

But thou, my country, dream not thou!
Wake, and behold how night is done,—
How on thy breast and o'er thy brow
Bursts the uprising sun!

Charles G. D. Roberts.

SOME EUROPEAN REPUBLICANS.

LAMENNAIS — MAZZINI — WORCELL — HERZEN.

I MEAN not here to give more than the briefest account of the lives and principles of the men about whom I have to write. Neither do I here attempt any history of European Republicanism. My object is but to present some personal reminiscences of certain men who suffered for their republican faith, whose names are yet held in esteem and reverence, who were indeed (at least in the belief of many) forerunners and heralds of the future, and whose doctrines and actions have not been without effect in shaping the changes which, during the last thirty years, have taken place in Europe. If I seem to speak too partially of these men, I hope to be generously forgiven. They were my own most dear and honored friends.

LAMENNAIS.

IT was, I think, as early as 1834 that I had sight of a little book then but lately published, but beginning to make some noise in the world: the "Words of a Believer" ("Paroles d'un Croyant"), by the Abbé de la Mennais. A little book indeed (it would scarcely occupy a sheet, *i. e.*, sixteen pages, of this CENTURY MAGAZINE), yet of sufficient importance to be condemned by the reigning Pope, Gregory XVI., in his Encyclical of 7th July, 1834, as, however small in size, of huge depravity (*mole quidem exiguum pravitate tamen ingentum*). In truth, the book, the earnest writing of a notably religious man, a Catholic priest who had been esteemed and honored by a former Pope, was of more than ordinary significance; nor needed the added impulse of an anathema to cause it to be widely read, and soon translated into all the principal European languages. It is open before me now, and, looking again through it, with less eagerness of thought than when it first possessed me with its spirit, I find my admiration warranted. Written in biblical language, it reads, both in tone and matter, like the utterance of an old Hebrew prophet: the voice of one crying out against the misdoings and the miseries of mankind. Some very short extracts may indicate its manner and general bearing.

"* * * In the balance of eternal right your will outweigheth the will of kings, for it is the people which makes kings, and kings are made for the peoples, not the peoples for kings.

"The heavenly Father has not formed the limbs of his children to be bruised by fetters, nor their souls to be murdered by servitude.

"He united them in families, and all families are as sisters; he united them in nations, and all nations are sisters: and whosoever separates families from families, or nations from nations, sunders that which God has joined, and does the work of Satan.

"* * * When you see a man led to prison or to punishment, be not hasty in yourselves to say — That is a wicked man, who has committed a crime against his fellows:

"For peradventure he is a man of worth, who desired to serve his fellows, and who for that is punished by their oppressors.

"When you see a people loaded with irons and delivered to the executioner, be not hasty to say — This people is an unruly people that would trouble the peace of the earth:

"For peradventure it is a martyr people, which suffers for the salvation of humanity.

"Eighteen centuries ago, in a city of the East, the pontiffs and the kings of that time nailed upon a cross, after having beaten him with rods, a seditious man, and a blasphemer: so they called him.

"The day of his death there was a great terror in hell, and a great joy in heaven.

"For the blood of the Just had saved the world."

Lamennais was writing when the martyrdom of Poland was yet fresh in the memories and the martyrization of Italy was beginning to stir the minds of liberal men in Europe. I may give one more extract; but no mere extracts can sufficiently show the mighty indignation, the deep pathos, the sublimity and beauty and wisdom of the whole work.

"If there is a people which less values justice and freedom than the laborer his wage, the artisan his scanty bread, the merchant his riches, * * * when the great day of the judgment of the peoples shall come, it will be asked: What hast thou done with thy soul? There is no sign nor trace of it. The joys of the mere brute have been all to thee. Thou hast loved the mire; go, perish in it!

"And the people which in its heart shall have placed worth above material wealth, which to achieve that shall have spared nor labor, nor fatigue, nor sacrifice, shall hear these words: To those who have souls the reward of souls! Because thou hast above all things loved liberty and justice, come, and possess forever justice and liberty."

Such words, so little adapted to please or king or pope, may well account for the anathema issued against them; which, however, had only the effect of adding to their writer's influence. Yet, ten years earlier, Lamennais had been preaching against the revolutionary spirit of the age, honored as

the eloquent defender of the Church, his portrait and a picture of the Virgin the only ornaments in the papal chamber when he visited Pope Leo XII., hoping that at his word the Church might lead the progress of the world.

Félicité Robert de la Mennais was born in 1782 at St. Malo, in Brittany, the birthplace of Abelard. He did not enter the priesthood till 1817: nevertheless, all his earlier hopes and writings had looked toward the Church. In 1824, so highly was he esteemed that it was by his advice Pope Leo XII. appointed Cardinal Lambruschini to be Apostolic Nuncio to France. Eight years after that, so much was his earnestness dreaded that the Russian, Prussian, and Austrian Ambassadors unitedly asked for his condemnation as a disturber of order: he had dared openly to speak for the people against the monarchy, and to appeal to Rome. Gregory XVI. bade him be silent. Discouraged, he for awhile obeyed. But one day, when Rome and the Monarchy believed him done with, he was heard again; and the words of a Believer were echoed throughout Europe. He had tried the Monarchy, both of the divine right and of the citizen branch; he had besought the Church: in vain. Thenceforth he was a Republican. In the ardent words of George Sand, "He initiated for us a crusade more glorious for our century and more memorable in the eyes of future generations, than the crusade provoked by St. Bernard: for not the sepulcher but the heritage of Christ is the conquest to which the Breton priest would lead us. We fight no longer against Islamism, but against the impiety of our social life; we seek the rescue not only of a few Christian slaves, but of the majority of the human race."

So much I may be allowed to quote from and to write concerning Lamennais, that something may be known of the purpose of his life. That unknown, what interest would there be in him? And now to my own small personal recollections. I do not pause even to give a list of the many works, religious, political, and philosophical, which place their writer's name among the foremost names of France.

In February, 1848, on the first news of the Three Days in Paris, some of us London Chartists* convened a public meeting, chiefly of working-men, to congratulate the French on the proclamation of their Republic. No need to say that the meeting (James Watson, the Chartist bookseller, of whom I have before written in *THE CENTURY*, in the chair) was crowded and enthusiastic, the first of many. Dobson Collet, well known afterward as secretary of the society for the ab-

olition of the newspaper taxes, and myself were deputed to present to the Provisional Government the congratulatory resolutions passed at the meeting. We crossed over to France with Mazzini, and for nearly a fortnight I shared his lodgings, and had the opportunity to become acquainted with many of those who shared his faith and hopes. Chief of these was Lamennais, then on the spur of the moment beginning a daily paper (the first number came out on the 27th of February), "*Le Peuple Constituant*," of which I possess probably the only complete series, the paper having been suppressed by Cavaignac in the first days of the June insurrection, on account of Lamennais' defense of the revolted workmen. After I returned home he sent me the paper daily, and it may be that no other copy except mine, mailed to England, escaped on the morning of its suppression. Going to the Rue Jacob, with Mazzini's introduction, I there found, in a poor room, sparsely furnished, and serving for bedroom and editorial office, a small, slight, and frail man, an unmistakable ecclesiastic, with somewhat of a severe expression, or rather with the power of severity, for in spite of the power the predominant look was benevolent. I have not to describe his features. What they were, can be seen in his profile, taken from a bas-relief by David, the great sculptor, who would not condescend to an unworthy subject, who refused to model the head of the Duc de Berri. What had he done to be commemorated? I have said Lamennais' face expressed both severity and benevolence. Something more and different was there also: You saw the truth and earnestness of a simple nature. But he looked feeble and worn, already wearied with his daily work (no slight work the editing of a daily paper to a man sixty-six years old) and anxious, too: for even in those first days Lamartine's peace-proclamation, meant to reassure monarchical Europe, was disappointing the Polish and Italian exiles, to whom Lamennais' heart was warmly true, and disappointing also those republicans who, like Godfrey Cavaignac, the nobler brother of the general, had some belief in the duty of republicans toward even foreigners struggling for a republic. Wearied and anxious as he was, I had a warm welcome from him, not less warm, one may be sure, for the sake of my introducer, nor for that some years before I had translated his "*Modern Slavery*" ("*L'Esclavage Moderne*"), a book less known, I think, than his other writings, but one which should be in the hands of every intelligent working-man and every political economist.

* See "Who Were the Chartists?" by Mr. Linton, in *THE CENTURY* for January, 1882.—EDITOR.

One evening I called to see him, and had to wait his coming in. Meanwhile I talked with an errand boy, on the stairs. Heaven send me such an apologist when I may need to be well spoken of! No son having to insist upon a father's praise could have been more fervent, as one grateful for constant kindness, held also and fascinated by the charm of the old man's nature.

Once again only after that time, in Paris, I saw Lamennais. I had been to find Mazzini, in Lausanne, toward organizing a staff of foreign correspondents for the London "Leader," a paper projected by Thornton Hunt (Leigh Hunt's son) and myself, and which I hoped to make the organ of the European republican party. I came back by Paris to see Herzen, to whom Mazzini had given me a letter. This was in February, 1850. Poor old Lamennais! The disasters of '48, that terrible June conflict which so weakened the Republic, the foreboding of further troubles (one could not pass through France without observing the renewed activity of the priestly party), had aged him more than years. Only my welcome was not feeble. I bear in reverent memory the kiss he gave me when we met and again in parting. I did not expect to see him again.

Under the Empire, like our own Milton after the Restoration, some strange lingering of shame and veneration left him undisturbed. He had had his share of imprisonment from Louis Philippe. He died in February, 1854. His family had been once rich, ennobled out of the ranks of commerce by Louis XVI. for generous aid to the poor in a time of famine. He himself had little of this world's wealth; and of that little he disinherited any of his relatives who had taken part against the insurgents of June. By his own direction he was buried, without ritual, in the pauper's ground. Only the name of *Félicité Lamennais*, "on a scrap of paper," marked the spot where Béranger bowed down over his old friend's grave.

MAZZINI.

AND now I write of him who seems to my judgment to be, like Saul, above all his fellows. I knew him first, not long after his arrival in England in 1837, through his acquaintance with my friend Joseph Toynebee, afterward of some repute as an aurist; but our intimacy dated from 1844, the year of the notorious letter-opening affair which disgraced the government of Lord Aberdeen. I think I first saw him at his Italian school, a school which he had founded and in which he gave regular lessons, being in all respects

its main support, for the gratuitous teaching of the poor Italians, chiefly the wretched organ-grinders of London, for whose benefit also he bestirred himself in other ways.

As I have said, I became intimate with Mazzini on occasion of the government's having ordered the opening (secret opening and fraudulent resealing) of his letters. He was then lodging in Devonshire street, a little street between Queen Square and Holborn. His suspicions were first aroused by a leader in the "Times," in which the writer referred to documents concerning an Italian association in London, and alluded to things not honestly to have been known by him. Then a letter-carrier, prompted partly by an Englishman's dislike of dirty work, partly moved by the strange magnetism which touched every one with whom Mazzini had any personal relations, gave him a further clew. If I recollect rightly, Lovett, the Chartist leader, had his letters (to or from Mazzini) opened also, as were mine. This made it our business; and, Lovett for some reason being unable to attend to it, it devolved upon me to help in bringing the matter before the House of Commons, through the agency of Thomas Duncombe, the radical member for Finsbury. Duncombe at first was very doubtful of our statements; but our proofs were clear and numerous. I used to post letters with a hair or small slip of paper under the seal (letters in those days, before envelopes came into general use, were sealed with wax). The method of opening enabled the operator to reseal, as if the seal had not been tampered with; but, not aware of the hair or slip of paper, these were invariably broken, by which, with the delay in delivery, we were always informed of the practical breach of confidence. It was this treason which drew forth Carlyle's manly letter in defense of Mazzini, when the editor of the "Times" sneered at Mazzini as "entirely unknown and entirely indifferent" to him, though "were he the most contemptible of mankind" it would not justify his treatment. Carlyle hotly wrote, and the "Times" dared not refuse to print:

* * "It may tend to throw further light on this matter if I now certify you, which I, in some sort, feel called upon to do, that M. Mazzini is not unknown to various competent persons in this country; and that he is very far indeed from being contemptible — none farther, or very few, of living men. I have had the honor to know M. Mazzini for a series of years; and whatever I may think of his practical insight and skill in worldly affairs, I can with great freedom testify to all men that he, if I have ever seen one such, is a man of genius and virtue, a man of sterling veracity, humanity, and nobleness of mind, one of those rare men, numerable, unfortunately, but as units in this world, who are worthy to be called martyr souls;

LAMENNAIS.

who, in silence, piously in their daily life, understand and practice what is meant by that. Of Italian democracies and Young Italy's sorrows, of extraneous Austrian emperors in Milan, or poor old chimerical Popes in Bologna, I know nothing and desire to know nothing; but this other thing I do know, and can here declare publicly to be a fact, which fact all of us that have occasion to comment on M. Mazzini and his affairs may do well to take along with us, as a thing leading toward new clearness, and not toward new additional darkness, regarding him and them."

From this time grew my intimacy with Mazzini. My family were living at Woodford, about eight miles from London, on the skirts of Hainault (oftener called Epping) Forest, I carrying on my business in the city. Mazzini would sometimes spend the Sunday with me, and it was under the trees, in our rambles about the forest, that I heard from his lips the story of the noble brothers Bandiera, decoyed and done to death by Austria through the letters copied by Lord Aberdeen. Aberdeen and Sir James Graham were the culprits—Foreign and Home Secretaries in an English quasi-Liberal government. Graham opened the letters and bore the greater share of odium; but it was Aberdeen who was the informer of Austria.

In 1847, at Mazzini's instigation, and looking to him for information, a society was formed in London, called "The People's International League," with the object of making the English public better acquainted with foreign affairs, partly for the sake of Italy and Poland, but also looking to other national questions likely to arise in Europe. How small the amount of information supplied by the newspapers of that day may be understood when I state that, engaged for a brief period on the "Spectator," then the best-con-

ducted of all our weekly papers, I found that all its foreign intelligence not borrowed from the two or three dailies was obtained from a single paper, the "Journal des Débats." The International League counted our foremost Radicals on its council or among its subscribers: W. J. Fox, the eloquent preacher, Colonel Peyronnet Thompson, and Peter A. Taylor (they, with Charles Villiers, the real beginners of the Anti-Corn Law movement), P. A. Taylor, Junior (the present member of Parliament), W. Bridges Adams (well known as an engineer), Douglas Jerrold, Thomas Duncombe, of post-office aid, and others. I had the honor of being honorary secretary, of writing, principally from Mazzini's dictation, our first address, and of lecturing for the League on the unity of Italy, and in defense of Ochsenein and the Swiss Government when the Catholic "Sonderbund" strove to break up the Confederation. I think I was the first

Englishman publicly to advocate the unity of Italy, then deemed by most of our politicians only an enthusiast's dream. But I name the League not so much for itself as to show the boundless activity of Mazzini, and on account of the opportunity it gave me for more frequent association with him. He always attended our council meetings, and always with him were present two Polish friends; of one I shall speak farther on; the other was Colonel Stolzman (whose letters also had been opened), an old soldier of Napoleon's, who had fought bravely during the Polish war, and who had been with Mazzini in Switzerland. The meetings were held in my house, and these three, when the meetings were over, generally remained for a glass of rum and water, that drink almost unknown on the Continent, and for an hour or more of conversation. The League did good work till 1848, when Mazzini's return to Italy, our Polish friends away also, threw us on our own resources. Some of our members, drawn in more out of personal adherence to Mazzini than from principle, his personal influence with them standing in the place of that, backed out; others were tired or lukewarm. The rapid course of events, too, in 1848 and 1849 seemed to many to render our work unnecessary. Enough that the endeavor was at an end. I have already spoken of the "Spectator." The little interest then (before Garibaldi's popularity) taken in foreign affairs may be seen in Carlyle's carelessness about "Young Italy's Sorrows," although at that time Mazzini was his frequent and welcomed visitor. Here I may note that Mazzini's review of Carlyle's "French Revolution," in the "Monthly Chronicle," contains the most thor-

ough and sufficient criticism of that notable book, a full recognition of the author's power, but pointing out his mistakes, both as philosopher and as historian. Not a history, but exaggerative pictures of the Revolution, is Mazzini's summing-up. He at this period was a valued contributor to the best English and French reviews, often depending on his pen for his living. His French was as excellent as his Italian. English, though he spoke and wrote it well, better than some of his translators, he seldom used, except in his intercourse with English people.

My next special recollection of him is at Lausanne, whither he had come after the defeat of Rome, escaping at Marseilles the search of the French police. When they came to look for him on the vessel which brought him from Italy, they passed without notice a man in his shirt-sleeves, coolly washing bottles in the cook's cabin; and so missed the triumvir, who had refused to be hidden like a stow-away. How well I call to mind the snowy February morning when, before daylight, after two days and nights of travel from the north of England, I got down from the Geneva diligence in Lausanne. I knew only that Mazzini was there, editing his "*Italy of the People*"; but where to find him I had no idea; I dared not make open inquiry, and I had not a single acquaintance or introduction. When daylight came I left my hotel and wandered through the streets, looking for some possible Italian exile. Italians and French I knew must be there; among the latter Félix Pyat, concerned in the protest against the French interference with Rome. At last, I stopped a passer-by, who I thought must be an Italian. I was right. We got into some sort of conversation in bad French (I could not speak Italian), and after general talk he trusted me enough to indicate where I "*might hear*" of my friend. I went. A letter could be forwarded, but "*he was not in the city.*" I wrote two lines and went back to my hotel. I had not long to wait before his note of welcome reached me. He and his always true comrade and friend, Aurelio Saffi, his fellow-triumvir, were living together. The outer and larger room was Saffi's, a small inner chamber was enough for Mazzini. For a week I spent my days with them. Perhaps, on the white wall over the chimney-piece, there may yet remain some sketches of flowers I made, to the great pleasure of Saffi, at finding they were common to both Italy and England. It was while I was there that an attempt was made, for the Piedmontese Government, to get hold of Mazzini,—frustrated by the fidelity of the Italians who were to be bribed to betray him. Treachery

had always shrunk before the daring of his faith. His trust in men made them honest. Once in London a man came to assassinate him. Mazzini, forewarned, received him. To the lying account the man gave of himself, he replied by quietly telling him whence he came, for what, and who and what he was. The man gave up his purpose. The net-work of politics was in Mazzini's hands. I think he knew of everything that passed or was prepared or projected in Europe. For himself he was as fearless as he was devoted; he never spared himself. Yet I have seen this man—dreaded by every monarchy, for that he was not only the Italian patriot, but also the apostle of Republicanism, the recognized leader of the European democracy,—I have seen him, when we have been going home from his Italian school, carry tenderly in his arms a little tired child, the child of one of his poor Italians. Feared and maligned by the Austrian enemies of his country, he was revered and loved, not only throughout Italy, but by all of the republican party elsewhere. Nor was he without honor and kindly regard from the more generous of his opponents, even from Victor Emmanuel himself, despite all policies of royal and constitutional Piedmont, or, as I would rather say, of the house of Savoy. Severe, self-contained, and inflexible, his heart was yet as gentle as a woman's. Not his the hardness of the fanatic, however absolute his faith. He was the Prometheus whose suffering abated not. Not only his intellect, his heart was in his work. When he came away from Rome, in 1849, after that heroic defense against the French, his hair was white with anxiety and grief. He was no less determined for the future. Once only I have seen him overcome by his emotions,—the tears standing in his eyes. Coming to me (I was then frequently seeing him), I noticed that something unusual was disturbing him. On inquiry, he told me that he had been visiting his friend Colonel Stolzmann; he had found him starving, starving in silence rather than be a burden to his friends, knowing how scanty were their means. So desperate at times was the lot of patriotic exile.

May I not here say something of Mazzini's political views? The world scarcely knows him except as the man whose thought directed the sword of Garibaldi, who, alternately thwarted and helped by the Piedmontese Cavour, did raise his Italy to nationhood. But he was more than this: he was the acknowledged head of European Republicanism; and, authorized and deputed by him to be the exponent of his principles in this country, it is a duty to lose no occasion for

saying what those principles were. Some interest, too, my readers may take in learning what I have meant by European Republicanism. I give no history of it but very briefly, neither to weary nor to obtrude. I would state what distinguishes the school of which he was the founder. So early as 1835, in his "*Foi et Avenir*," he broke away from the traditions of the first French Revolution, denied the necessity of looking always to France for the Revolutionary initiative; and boldly and distinctly declared the insufficiency of the theory of *rights*. Not right, but duty, he asserted to be the basis of human action; not the desire of happiness (even of "the greatest number"), but sacrifice the beginning of all real progress. So he took his stand at once as not merely the political but as a religious reformer. In the universality of duty he found the need of freedom for every people, toward growth into nationhood: that nationhood no longer mapped out to suit the convenience of a few royal families, but constituted according to natural fitness and attraction, for the sake of closer fellowship and greater power in the world's work. This may sufficiently indicate the starting-point, both religious and philosophical, of all his thought and action. His political beliefs were, to use his own words, but the consequences more or less direct, more or less apparent, of this supreme faith. With him the individual right was to be free *and fitted* for the public duty. Like Milton, he held that "the commonwealth ought to be but as one mighty growth and stature of an honest man, as big and compact in virtue as in body." Like Lamennais also, above all things religious, he insisted on the brotherhood of nations, on the duty of nations towards humanity. Whosoever separates families from families, and nations from nations, divides what God would have united.

I repeat, it is not only as the Italian that Mazzini is to be considered. Ardent lover of his country, his patriotism looked beyond the Alps; and, ever true to his world-wide creed, he may be forgiven for the hope that, in free Rome, he might one day proclaim a new religion to the world, not prefacing it with denial of the past. To him the past also was sacred, except where lost in the present, and so betraying the future. He, too, like Lamennais, when a reforming Pope seemed possible, appealed to established power to lead on the way of progress. For he was a builder, not only a revolutionist. Family, country, the holiness of work, the right of property as the fruit of work, the mutual duty of society and the individual,—these words are as the signposts of his belief and unintermitted teaching

to Italy, and, as he hoped, through Italy to the world. "We believe," he wrote in 1850, in the manifesto of the Central European Committee, a manifesto with the names also subscribed of Arnold Ruge, Ledru Rollin, and Albert Darasz (for the Polish Democratic Centralization),—"we believe in a social state having God and his law at the summit, the people, the universality of free citizens at its base, progress for rule, association as means, devotion for baptism, genius and virtue for lights upon the way. And that which we believe to be true for a single people, we believe to be true for all."

I am careful only to show the grounds and motive principles of Mazzini's thought and action. It is not here that I may develop his views upon particular political or social questions. I am not writing his history. Enough that, knowing intimately of his course, I find no swerving for the sake of temporary success, no stooping to buy success by the petty expediences of politicians.

And how the man was loved by all who came within his circle of fascination! I know of only one man to speak ill of him. I am sorry to say that man was an Italian, a refugee; but he was of the type of Bozza, the mosaic-worker in George Sand's "*Maitres Mosaistes*," ambitious, envious, grudging that any one should overtop himself. For the rest, he was surrounded by attached friends. Gentle with children, reverent and courtly toward women, manly and courteous he was with men. His hand-grasp was that of a brother, his smile had a woman's charm, and the clear, steady fire of his eyes spoke at once of energy and truth. Accompanying some Polish friends, I spent once a morning with Kossuth. Affable, agreeable, interesting, I was much pleased with him; but, with no intention of criticising him, I could not help observing a certain deadness of eye, not noticeable when he spoke in public. I thought then, perhaps unfairly, judging how the one man needed excitement to stir his spirit, how the soul of the other was an inner lamp, shining through him always. The strength of Mazzini's personal influence lay here. You could not doubt his glance. I think the same force was in his written words, though Harriet Martineau told me she could not understand them. I could understand why. She got at them only in translations by writers who had not understood what they translated. Also, she was not over-ready to receive new impressions. In English estimation he has suffered much through his translators. His Italians understood him, and the magic of his voice was potent to reach Garibaldi in Monte-Video and Foresti (Silvio Pellico's prison-mate at

Joseph Mazzini,

Spielberg) in New York. "Who is this Mazzini?" was Foresti's first question when he came out of his prison of so many years. Never man more than Mazzini deserved the characterization — He believes all he says.

I turn not away from him when I come to speak of his closest friend and comrade, Stanislas Worcell, my own friend too.

WORCELL.

WORCELL was a native of Volhynia, in some way connected with the royal Czartoryski family, a man of refined and poetic nature, possessor of large estates, and living the easy luxurious life of a wealthy nobleman. When Poland, in 1830, rose against the Czar, he armed a troop of his own peasantry and, placing himself at the head of the insurgents of his district, fought his way through the Russian forces till he reached Warsaw. There, elected a member of the Polish Diet, he sat as representative of Volhynia. After the taking of Warsaw by the Russians, and the overthrow of the Polish cause, escaping through Germany and Switzerland to France, he joined the exiles there, forming the Polish "Union," under the presidency of the historian Lelewel. He was of sufficient importance for the government of Louis Philippe to expel him, on the requisition of the Russian ambassador. For a time he took refuge in Belgium; thence passing to England, where I was introduced to him by Mazzini in 1844, the letter-opening year. Again in France for some while before the revolution of '48, he was in '49, with his friend Darasz, again expelled, under pretext that they were concerned in the manifestation of Ledru Rollin, Considerant, and others, against the French invasion of Rome. As republicans, of course, they were *concerned*. He returned to England, remaining there till his death, in 1857. I knew him intimately.

Contemporary history misses the name of Worcell. When some later Lelewel shall write the story of the Emigration, when Poland shall be again a nation, his name will be beside that of Kosciusko. Now, to him might be applied the words of Landor concerning the old Greek philosopher: "He neither lived nor died with the multitude; there are, however, some Clazomenians who know that Anaxagoras was of Clazomenia." Some republicans can yet remember that Worcell was of our best. We had called him our best, had there been no Mazzini.

Those two men were as brothers; Mazzini treating Worcell with the affection and respect due to an elder. It seemed almost as if the love in his heart for Jacobo Ruffini

WORCELL.

(the youthful friend and fellow-prisoner who killed himself when told by his Piedmontese jailers that Mazzini had betrayed him, they so seeking to persuade him to confess) had been transferred to the beloved Pole. Beloved and revered by all, he was the Nestor of the republican camp.

I know not how old he was. He never spoke of himself, nor of his family. He had left behind him in Poland a wife, a young son, and a brother, who probably looked on him as a patriotic fool; it may be as a monster of iniquity, a rebel. Of them, not from them, I think he sometimes heard; and now and then through half-friendly hands came some small scraps of what had once been his, to keep him from occasional want of bread, or to enable his most unselfish generosity to help some other suffering exile.

Brought up in luxury, highly educated, accomplished (not excepting Mazzini, I have never met a man who, so far as I could judge, was possessed of wider or profounder knowledge); his tastes literary and artistic; gentle, courtly, almost fastidious, yet dignified; a patrician in all but the patrician's haughty exclusiveness, this man gave up all, and he "had great possessions," to follow the shadow of patriotism; left all,— wife, child, fortune, ease, the student's calm, the pleasant ways of peace, for which none was ever better qualified, forsaking all personal joys and interests at the stern command of duty. Such men are the saviors of the world. Surely such devotion (not so singular among Poles) prophesies of the Poland yet to be.

And never in his extremest destitution, never under any agony of suffering, was word of complaint or of regret wrung from that most saintly and most devoted heart. Never accent of lament for himself profaned the lips of that most serene of martyrs, though he knew the depths of poverty: poverty of the affections,—two photographs, one of his child brought up as a Russian, this all, instead of home; material poverty, for of the little that came not regularly there were always sharers. So poor was he, yet uncomplaining, with the pride of a gentleman, the one sole vestige of his early days, that a friend who wanted to be of help had to take a lodging in the same house with him, in order that, under pretense of consulting him on certain matters, he might do little services not possible otherwise; yet, poor as that, when almost in his last days, remittances from abroad failing, he had to ask a loan, and the lender made it a condition that the money should be strictly applied to his own use, he indignantly refused to be so precluded from help to any whose need might be greater than his own. It was Sidney on the field of Zutphen over again. For the honor of the friend who so mistook him, let it be said that he promptly withdrew the condition, and was but the more delicate and unremitting in his after kindness.

Suffering continually from asthma, aggravated by his having to live, and living so poorly, in London, I do not recall a day through the latter years in which he was at ease save once when he visited me at Coniston. There, climbing with difficulty the fells behind my house, to get a better view of the lake and mountains, as he reached a height and rested, the pure mountain air revived him, and for the moment made him a new man. But weak, out of health, or in pain, he was ever ready, at any inconvenience, at any suffering or risk, to meet the constant calls upon him for advice or for exertion. Poor old man! I can see him now, scarcely able to walk and not fit to leave his bed, quitting his comfortless hotel in Liverpool, leaning upon my arm as he went to busy himself for the safe landing and bestowal of some two hundred and more Poles, escaped from their imprisonment with Kossuth at Kutayeh: two hundred and seventy gaunt men (all but nine of them Poles), worn, ragged soldiers of the Hungarian war for Hungarian freedom, for whom the English Government had no provision; in whom the Gladstones and Martineaus of wealthy Liverpool took no sort of interest. Their poor countryman stood almost alone in his feebleness to welcome them. The Government of that day, called Liberal, a Russell prime minister, took from the strangers

(as they had no money wherewith to pay the ordinary customs dues) a tenth of the biscuits remaining to them after a quick voyage. I saw the biscuits weighed upon the wharf by the unwilling custom-house officers, with a Polish cordon around the scales to keep off a hungry crowd—the thieves and the poor of Liverpool. One generous rich man in Liverpool, Peter Stewart, a cooper, found shelter for these unfortunates in an empty soap manufactory, gave money, too, for the immediate need; and a committee of working-men, followed by other such committees in different parts of the country, took charge of them till they could be placed in positions to support themselves. But Worcell was head and heart of this, as of all other matters of the Polish exile. To him, as chief of the democratic party, everything was referred. The whole body of refugees looked to him as to a father.

I might write on, not knowing when to pause, of this man whom in truth I loved as a father, of whose regard for me I am as proud as I was sure. Perhaps I speak fondly and too partially. Herzen, who also knew him, may take my place and speak for me; it will be only a change of words. It is from Herzen's Russian paper, "The Polar Star," that I now quote:

"On the 3d of February (1857), in a little street in London, in a poor chamber on the ground floor, there, hardly remarked, ceased a holy existence. Poland counts one martyr more. She will not refuse to lend his martyrology to us Russians. We need it for the teaching of our children.

"Worcell was a saint. I use this word with intention; it best expresses his character. The whole existence of this man was an act of unbounded devotedness, of complete self-abnegation, of incessant travail. All that most strikes us in the legends of the saints we find in him, trait for trait, with more of love, with a wider human element. * * * Twenty-six years he labored in exile for the organization of the democratic and republican party in the Polish emigration. Whelmed in misfortunes, privations, maladies, he was day and night at his work, with that calm serenity, that resigned gentleness, that candid simplicity, which a faith not to be shaken gives to a great heart.

"No one ever heard a single plaint from his mouth. Of that I am sure. He was sometimes sadder; that was all. I would know if any one of the friends intimate with him was ever witness to one of those moments of bitterness and indignation when wrath, overcoming faith, drags from us those cold and biting words of doubt and despair, with which man would revenge himself for the agonies he has felt. Never have I heard such words from Worcell's lips; and I was closely linked to him,—there was a time when I saw him every day.

"His was one of those whole natures,—I would say more,—one of those fanatical natures which, dominated by one thought, having one grand and only end in view, reach the calm of a perfect resolution, an imperturbable tranquillity, and through that to a great gentleness as well as to an inflexible will. Such have been the martyrs of science, the heroes of religion. For such men there is no stop, no fatigue, no return. The principal thing has been absolutely decided for

ALEXANDER HERZEN.

them in the forum of their own souls. The rest — the mere happening — does not occupy their thought. They have only to continue, to march on, *ora e semper*, holding on their way: misfortunes, poverty, abandonment, the sobs of the feeble, the cries of those who would hang back, the groans of the fallen, prison, chains, the gallows, — shall they halt on their way for that? Not they! They keep the same step, calm, austere, unbroken. That was the step of Worcell. It is the step of one of his friends, whom he passionately loved — Joseph Mazzini.

"Faithful soldier of Poland, he was always at his post, even to the hour when his hand, already stiffening in death, traced the touching words repeated by Ledru Rollin at his grave."

"Those words remind me of another time. Nine years ago, some days after the Revolution of February, Lamartine (like those husbands in some savage countries, who lie in state when their wives are brought to bed) was receiving congratulations on occasion of the birth of the Republic. Among the deputations one group held themselves apart, a group in which were men with white hair and grizzled mustaches. On their manly faces, furrowed by misfortune, one saw the severe intrepidity of the old soldier and the sadness of the exile. Their spokesman — it was Worcell — said to Lamartine, or rather to the French Republic: 'To every appeal of the peoples, in the years of struggle and distress, Poland has been first to answer *Here!* for she saw in every attempt for liberty a help for Poland. She is here now.' There was in these words something most sadly solemn, as if it were the involuntary reproach of a generous people which had been sacrificed.

"Toward the end of 1852, coming from Italy, I met Worcell in London. [Herzen came to organize a Russian propagandism, and spoke of it to Worcell, whose help was prompt. The printing-office of the Polish Centralization was placed at his disposal; and not only that, whatever means the Centralization commanded to send papers through Poland were at his service also. How his publications penetrated into and spread through Russia is well known.] Poor dear friend! I see him now, with that face so full of suffering, that intelligent look, those white hairs, that voice feeble from sickness, holding in his hands the

first sheet printed in Russian in London; and I hear him saying, 'My God! my God! a free Russian press! Ah! how much of the sad happenings of these last days is effaced by this bit of paper.' Afterward, taking both my hands in his, he repeated, 'Yes! we ought to march together: we have the same enemy: we ought to be united.'

"Worcell was of a nature eminently religious. That certain mysticism which we meet with almost always in the Polish poets had strong roots in his soul, without, however, having the power to trouble the great lucidity of his mind. His genius was logical, wide-sighted, but at the same time delicately subtle. Highly endowed with the faculty of abstract reasoning, he naturally became a profound mathematician. His active and ardent mind stopped not, however, at astronomy and geometry, but studied in turn all the natural sciences. His erudition was prodigious. He occupied himself with everything, was interested in everything, and forgot nothing. Speaking, well and elegantly, French, English, and German, he was thoroughly acquainted with modern literature. I often addressed myself to him as to a living cyclopædia; and the answer was always ready. Conscientious in everything, if he thought afterward that he had been wrong, he would next day write in correction. This mass of varied knowledge, with a reflection of mysticism thrown upon it, gave a peculiar originality to his conversation and to his way of looking at things.

"And all this — science and mysticism, history and mathematics — was only on the lower plane of his life. Above all was his religion, the thought of his whole existence, his faith in Poland. The rest was only recreation, relaxation. His powers, his dreams, his being, his whole soul, were there. His last words were an appeal to Mazzini standing beside him, that he would under no circumstances be unmindful of Poland. Mazzini wrote and showed him a few words. The old man could not speak, but his whole appearance was transfigured. His eyes brightened with a superhuman brilliance. He thanked him with a look in which content and ecstasy were as strong as death. I thought of St. Jerome receiving the last sacraments (Domenichino's picture in the Vatican). The same faith passing beyond the tomb, the same sacrifice, the same tranquillity at last."

HERZEN.

I CLAIM Herzen for our republican party, although, as Russian, his tendencies were naturally toward communism, and though he cherished some sort of belief that through Russia, rather than through effete Western Europe, the change from monarchical rule must come. Certainly, Russia is not to be judged by Western precedents; nor does it seem necessary, notwithstanding Palmerston, that it should follow the Western course from absolute to constitutional monarchy, from patriarchal rule to *laissez-faire*, before it can reach the republic. But I claim him, in spite of some heretical opinions, in virtue of his close fellowship and ever active assistance in our republican propagandism and action. His early life is well told by himself, in "My Exile." I need not repeat it here. He was the one man among the exiles who might be fairly called rich. Of noble family, like Worcell, when he had permission to travel, he

* When he could no longer speak, he made signs for a pen, and wrote — "*Soldat fidèle, j'ai achevé ma faction, — qu'un autre me relève!*" (My watch is over, let another take my place!)

THE FIRST RUSSIAN MARTYRS FOR REPUBLICANISM.

not intending to return, sold his estates; and the Czar, who would have confiscated them on account of his rebellious absence, found that they were mortgaged to one Rothschild, whom even a Czar might hesitate to offend. Herzen had secured an annuity. A voluntary exile, he had also been able to take his family with him. His wife, for the sake of whose health he had been allowed to go out of Russia, died soon after. He was alone when I first met him in Paris, in 1850, as I was returning from Lausanne. Probably he had remained there, but that the work for which he was preparing (he was already known by his book "On the Development of Revolutionary Ideas in Russia," written in French, and first published in France) was not to be carried on under the empire. He had, therefore, to come to England, whence he issued his "Kolokol, the Alarm Bell," which penetrated to the very chamber of the Czar and stirred the soul of Russia, unmoved for a quarter of a century.

Not first to move it, though first to move it with success, he took up the tradition of an earlier time, of Pestel and his companions, whose abortive attempt, on the accession of Nicholas, in 1825, may be chronicled as the first endeavor toward Russian freedom. Of them so little is known, that I may be allowed to say some few words.

Alexander's victorious army did not return from Paris after the fall of Napoleon with only laurel wreaths; they took some leaves of Western books, some thoughts of Western minds, and scarcely crossed the Slavonic frontier before secret societies began to stir the old-time stagnancy. Two brothers, Alexander and Nikita Mouravieff, officers in the army, organized, first in Lithuania and afterward in Petersburg, a political association. In Petersburg they were joined by Pestel, a colonel in the line and son of the governor

of Siberia. The conspiracy spread rapidly, enrolling soldiers and officers, men of the noblest families, such as Prince Troubetskoi, and young students and literary men, like Ryleiff and Bestujier. Pestel became the leader, a man of far-seeing thought and of great organizing capacity. The establishment of a republic and the emancipation of the serfs were his avowed objects. For nine years this revolutionary propagandism continued, spreading throughout Russia, unbetrayed. On the death of Alexander, the conspiracy culminated; but the more aristocratic leaders hung back, and their indecision lost the cause. I need not recount the well-known story of the massacre on Isaac's Plain, which inaugurated the accession of Nicholas, when whole regiments were mowed down by grape-shot. Pestel, Ryleiff, Sergius Mouravieff (not one of the Mouravieffs before named), Bestujier, and Kachofski, less fortunate, expiated their patriotism on the gallows. They were not forgotten. On the 25th of January, 1831, when the Polish Diet asserted their independence, the martyrdom of the Russian republicans was commemorated by a solemn procession. Five coffins, bearing their names, passed through the streets of Warsaw, under flags inscribed in Russian and Polish with the words, "For our liberty and yours."

In 1853, on the 29th of November (the always remembered anniversary of the outbreak of the Polish insurrection), I had the honor of taking part in a meeting (Worcell in the chair) in London, called by the Poles to urge the necessity of war with Russia,—a more earnest war, of course, than that carried on by Lord Aberdeen under Napoleon in the Crimea, a war of which the first campaign should have been through Poland. Herzen stood beside his Polish friend, Colonel Pianciani, Mazzini's trusty henchman, was there to speak for Mazzini (too ill to be present),

Arnold Ruge spoke for the Germans, Dr. Ronay for the Hungarians, Ledru Rollin for the French. No mere narrowness of an isolated patriotism could keep Herzen away from what he deemed the higher cause of justice to all nations. In private life he was the same. His home, where he was happy with his children (a boy and two girls), a pleasant country mansion on the side of the Thames, at Teddington, not far from the residence of the exiled Orleans family, where he lived simply, not meanly, was the resort of men of all countries. I was there on the day the news came of the death of the Czar Nicholas, in 1855. His rooms were crowded with exiles — Russians, Poles, Frenchmen, Germans, Italians. It was a modern Babel, a festival of polyglot congratulations, a confusion of men wild with a fierce delight, as in the saturnalia of old. Herzen, the impulsive Slavonian, was drunk with joy. Strolling through his grounds which reached the river, at one point but slightly fenced off from the public road, he flung money among a crowd of boys attracted by our uproar, merely to hear them shout, "Nicholas is dead." It was the passionate frenzy of the newly emancipated serf, child-like, not malevolent; he seemed to have need of uttering the jubilant feeling of his whole race.

Two years later, when we were fellow-mourners with Ledru Rollin and Mazzini at the burial of Worcell, when the coffin was to be carried from the chapel of Highgate Cemetery to the grave, Herzen, the tears coursing down his cheeks, stepped forward and placed himself beneath as one of the bearers. It was not only the impulsive action of a man who loved his friend; it meant also homage to the noble Pole, an acknowledgment of the debt of the Muscovite to Poland. "Poland amnesies us," he had said, beginning his speech at one meeting three years before.

Yet this man, the rich-blooded barbarian — impulsive, child-like, carried away by enthusiasm where his feelings were concerned — was wise and diplomatic, a profound and subtle thinker, choice of speech as well as ready, clear and concise as well as impressive, with remarkable power of apt illustration, witty, too, and a "lord of irony." Ever with some lightning-like flash withering the flowers of poetry in others, he was, though no verse-writer himself, a poet not only at heart, but in expression. His personal appearance is well described by Castelar: "Short of stature" (latterly inclined to corpulency), "with a large head, long fair hair, like a Goth's" (fair

in the eyes of a Spaniard — chestnut rather than fair), "clear complexion, light beard" (chestnut, too), "and small, luminous eyes, like those of the Huns, which so terrified the degenerate Romans." With these traits of the Northern races, adds Castelar, "he had, in the vividness of his speech, in the fire which animated it, in the strong emotion by which he was agitated, in the sudden transitions from the sublime to the grotesque, in his marvelous variety and inimitable grace, all the warmth and verve of the South."

The *ordonnance* for the emancipation of the serf, so long advocated by him, was Herzen's triumph. Dying at Paris in 1870, he had found his reward. One other of his dreams may also yet be realized. He pleased himself with visions for Siberia. In 1855 he wrote:

"Siberia has a great future; though now only looked upon as a reservoir containing money, furs, and other natural products, but cold, snow-covered, poor in provisions and means of communication, and thinly peopled. All that, however, is not correct. The Russian Government, which kills everything, which produces nothing but by the stick, does not understand how to give that impulse of life which would bring Siberia forward with American rapidity. We shall see what astonishing results will come when one day the mouth of the Amoor is opened for navigation, and America meets Siberia on the confines of China."

Professor Pumpelly's "Across Two Continents" confirms the views of Herzen.

Herzen has been accused of many things: of being a spy — the man who gave so many proofs of personal love and public devotion; — of being infected with Western and anti-Russian ideas, because he believed that empire is not nationality; of Slavophilism, while he was rebuking the Slavophiles for caring only to change the collar of German slavery (under the Romanoffs) for a Slavo-Byzantine collar, and while he ever consistently insisted upon the nationality of Poland. He has also been ranked among the communists. Certainly he recognized and defended what I may be allowed to call the native communism of Russia. A Russian could hardly turn away from that; but the dissolving acid of his irony, no less than the religious fervor of Mazzini, spared never the dogmatic systems of "Socialism" and "Communism," which in those days were the utopias of the West. A social reformer nevertheless, not to be satisfied with mere political change, a republican not only in name.

But it is time for me to stop, content if I have given some faint presentment of men whose thoughts yet live, whose names may not be forgotten.

W. J. Linton.

VERDI, THE COMPOSER.

FEW biographies of modern musicians have been written whereof the heroes still live, and among the men concerning whose personal characteristics very little has been told in the public prints Giuseppe Verdi stands first and foremost. It may be urged that, as an individual is best known by his deeds, so can Italy's greatest contemporary composer be studied to most advantage through his performances; nevertheless, as an acquaintance with the writer's twenty-seven operas will not enlighten one as to the noteworthy incidents of the composer's career, his appearance, or his peculiar habits, it is safe to presume that some curiosity on these points is still unsated. Under the circumstances Verdi's publisher, Signor Ricordi of Milan, has a claim on our gratitude for gathering in a neat volume a number of anecdotes touching the composer, printed long ago by M. Arthur Pougin in a Parisian musical journal; for supplementing these anecdotes with corrections and addenda, contributed by Verdi's friends; and for giving them, in a rather discursive way, perhaps, to the world at large. Time will come when a more ambitious and comprehensive work will be welcomed by the public and especially by *dilettanti*; and the production of a book of this sort will certainly loosen the hold of Ricordi's publication upon the thoughtful reader. For the present, however, the gossip character of the Milanese sketch, and the belief that a fair proportion of its contents will repay rehearsal and translation into English, may be an excuse for drawing liberally upon its facts, figures, and illustrations—the compiler of the volume carefully avoiding comment and criticism—for the behoof of the musician's English-speaking admirers.

The composer of the best-known operas of the age was born at Roncole, a small village in the duchy of Parma, three miles from Busseto. His father and mother, Carlo and Luigia Verdi, kept a wretched *osteria*, and as the patronage of the whole population of two hundred souls would have been insufficient to yield a living income, they carried on, besides, a petty trade in tobacco, coffee, sugar, and groceries. The exact date of their son's birth has never been ascertained, but the baptismal entry in the register of the church of San Michele being dated October 11, 1813, it is pretty certain that the infant must have been between twenty-four and forty-eight

hours old when christened Fortuninus Josephus Franciscus—to quote the Latin names embodied in the formal certificate. His childhood went by quietly enough. We learn that his mother bestowed most attention upon his education; that the lad was passionately fond of her; that he was rather timid, reserved, and even serious for his age; and that the first indications of his liking for music were afforded by his partiality for hand-organs, which he invariably followed about until their owners were far beyond the last houses of the village. Circumstances proved favorable to the development of his musical talent. There was no school at Roncole, but the church of San Michele was possessed of an organ, and the boy's parents, recognizing that their son would ere long have to earn his livelihood, thought that by confiding him to the care of the local organist he might in due course be appointed his successor. After a three-years' course of study the wishes of Verdi's parents were gratified, and the lad became organist of the parish church. He was then in his eleventh year, and tolerably ignorant, no doubt, in matters familiar to schoolboys generally; so his father at once decided that he should take up his abode at Busseto, where he could at least obtain elementary instruction, while discharging his duties as village organist on Sundays and holidays. Verdi sustained the double part of pupil and *maestro* for the seven years of a Biblical term of servitude. On week-days he studied at Busseto, and, on Sundays and whenever the numerous *feste* of the church came about, he was beheld at the organ of San Michele. Small as were his emoluments, they were not to be despised, for his parents were well-nigh as poor as people in sunny Italy can be. The honoraria were insignificant enough for all that: including fees for funeral services, christenings, and marriages, they did not exceed one hundred *lire* (twenty dollars) per annum,—this slender amount, however, being somewhat augmented by the collection which, in accordance with an established usage, the organist always took up at harvest-time. Two years rolled by, and young Verdi learned to read, write, and cipher. As a reward for his industry his father got him employment in a distillery managed by one Antonio Barezzi, an amateur of no mean ability. Verdi's admission to Barezzi's household finally determined the bent of his career.

Busseto is a small town with a population

THE BIRTHPLACE OF GIUSEPPE VERDI, RONCOLE, ITALY.

of two thousand souls. The history of the duchy of Parma records that its inhabitants were always noted for their ardent love of music; and Barezzi was among the most faithful worshipers of local traditions. His abode was the headquarters of the Philharmonic Society of the place; it was provided with a small concert-hall, in which the musical performances of the season were given, and the rooms were filled with instruments of every description. Under the influence of these surroundings Verdi's penchant for his art grew stronger and stronger. He devoted all his leisure hours to close study, never missed a rehearsal and concert held under Signor Barezzi's roof, and did an amount of copyist's work that finally won him the good graces of Ferdinando Provesi, his teacher, who was the town organist and the conductor of all musical affairs occurring at Busseto. Provesi conceived a strong affection for young Verdi, and when the latter attained his seventeenth year his instructor resigned the position of *maestro* of the Philharmonic Society in favor of his pupil, who also replaced him occasionally at the organ of the cathedral. The archives of the society contain abundant proofs of the youth's industry. He composed a good deal, instrumented his compositions, and copied the parts with his own hand. It was clear, however, that so small a place as Busseto offered no field for the exercise of his talent. He soon became aware of the fact, and conferred on the subject with Barezzi and Provesi. Milan was not remote, and the question arose

as to the advisability of going thither. Barezzi set about gathering the requisite funds, and succeeded in obtaining for his *protégé* a yearly income of six hundred francs, payable for two successive years, the total amount constituting the revenue of one of four scholarships in the gift of the Monte di Pietà of Busseto, a charitable institution founded in the days of the plague for the purpose of helping the poor and encouraging native talent. As the annual stipend of six hundred francs appeared insufficient to meet the young man's needs, Barezzi made up the requisite amount, and, further, gave Verdi letters to Seletti, a personal friend, to whose care he commended him with special earnestness.

Verdi's first disappointment befell him in Milan. Immediately on arriving, having been assigned a room in Seletti's house, he visited the Conservatory and applied for admission. The institution was then directed by Francesco Basily, an aged musician of unquestionable skill and experience, but from all accounts a man utterly devoid of artistic instinct and sensibility. Strange to say, he could make nothing of the new-comer, and Verdi's application was rejected on the ground that the youth showed no disposition for music. Fétis, in his "Universal Biography," suggests odd reasons for Basily's decision. To his thinking the icy air, impassible countenance, thin lips, and steely *ensemble* might have indicated the candidate's intelligence and fitness for diplomacy, but could never have been the outward signs of the soul of a creative artist. Aside from the

worthlessness of Fétis's argument in favor of admitting a student on the promise of his looks, it is evident that the Belgian writer never saw the composer under the influence of unusual excitement. A glance at Verdi seated at the conductor's desk during a representation of "Aïda" in the Paris Opera House would dispel any uncertainty as to the expressiveness and power of the strong if simple and rugged face of the great musician. Fortunately all Basily's co-laborers shared not his views. The youth was not discouraged, and instead of withdrawing from the contest he turned elsewhere for instruction. He had a letter to Alessandro Rolla, leader of the orchestra of La Scala, and Rolla sent him to Vincenzo Lavigna, who at that period was engaged as *maestro al cembalo*, or accompanist, in the same theater, and had brought forth some operas which had achieved a fair measure of success. Verdi addressed himself to Lavigna, and laid before him the same compositions he had presented to Basily. The result was wholly different, for Lavigna instantly consented to give Verdi lessons, and soon afterwards predicted to Barezzi, who never lost sight of his favorite, that the time would come when Verdi would do honor to his master and country. Meanwhile the student became known in the art-circles of the Lombard capital. There was then in existence in Milan — and there still exists there, by the way — an association of *dilettanti* calling themselves the Società Filodrammatica, that gave a semi-public entertainment on Friday of each week. In 1831 the Società was preparing to bring out Haydn's "Creation," when, of a sudden, the *maestro* in charge took fright at the difficulty of his task and laid down his *bâton*. One Masini, a singing-teacher, who was to direct the choral part of the performance, said to the managing committee, over whose deliberations Count Renato Borromeo presided:

"I know but one man here that can help us out of our plight — *il maestrino*."

"Who is the *maestrino*?" inquired Duke Visconti.

"His name is Verdi," was Masini's answer, "and he reads the most puzzling scores at sight."

"Well," said the Duke, "send for him."

Masini obeyed, and Verdi speedily made his appearance. He was handed the score of "The Creation," and he undertook to direct the performance. Rehearsals commenced, and the final rendering of the oratorio was set down as most creditable to all concerned. Toward the same period he devoted his attention to the composition of several works intended for the public, and marches, overtures, symphonies, and cantatas followed each other

in rapid succession. The marches were mainly composed for the Philharmonic Society of Busseto, where they were performed on the holy days of the church, and one of the series was refashioned and did duty as the funeral march in "Nabucco"; while fragments of other achievements bearing the same date and never published came in with good effect in "I Lombardi."

In 1833 Ferdinando Provesi passed away, at the ripe age of seventy. The Monte di Pietà had contributed to Verdi's maintenance with a view to securing his services as successor to Provesi, and the debt of gratitude had to be paid. Verdi returned to Busseto, and carried on a protracted struggle with one Ferrari, a mediocre musician, who coveted the position of *maestro di musica*, and was supported in his claims by the clergy. For four or five years Busseto, thanks to the obstinacy of the rival parties, profited by the labors of two *maestri*. The admirers of Ferrari had possession of the cathedral, but Verdi and his orchestral and choral forces were accorded the use of a small chapel belonging to the Franciscan monks, and there the motets of the young composer were listened to every Sunday, while an afternoon performance of the band on the piazza followed divine service, and attracted the whole population. His more pretentious works were executed in the Franciscan church, and when Verdi played the organ and directed the performance of some new composition, the cathedral presented a beggarly array of empty benches, while the rival house of prayer was filled to overflowing. His fame, moreover, extended in every direction, and ere long all the villages of the vicinity strove to secure a visit from the *maestro* and his associates. Often two or three omnibuses drove over the hot white roads, and bore off Verdi and his choir and band to some hospitable hamlet near by. Mass and vespers were sung, an *al fresco* concert was given, and a festal day was merrily spent. The southern demonstrations of joy and enthusiasm with which the *maestro* was greeted on occasions of this kind can hardly have been forgotten, even amid the pomp and brilliancy of later triumphs.

During Verdi's stay at Busseto, which ended in 1838, when he quitted the town and took up his abode in Milan, one important event in his private life demands mention. Barezzi, although the father of a numerous family, had always treated his *protégé* as a son. The terms of intimacy upon which Verdi lived with his benefactor's children ripened, in respect of Barezzi's eldest daughter, into a stronger feeling. His boyish attachment for Margherita Barezzi, who is described as hav-

ing been comely and intelligent, developed into love. Margherita was impressed with the talent and industry of the youth, and she believed in his future. The young people sought Barezzi's consent to their marriage, and the father met the request with a reply that he should never refuse to give a child of his in marriage to a worthy young man whose capacity and steadiness he regarded as quite as valuable a possession as wealth. The wedding was celebrated in 1836, when Verdi was in his twenty-third year. Two years afterward, when Margherita had borne him two children, his engagement with the municipality having expired, and the annual honorarium of three hundred lire being quite insufficient for the support of the composer and his family, his *lares* and *penates* were made ready for removal, and once again the musician journeyed toward Milan.

From the day of his arrival in the chief city of Lombardy, Verdi became possessed of a single thought and object: success on the lyric stage. Fortune served him admirably from the first. He became acquainted with a young poet, Temistocle Solera by name, whose ambition ran in the same groove. Solera was but nineteen, and a good musician as well as a clever librettist. The two aspirants to fame having determined to strike up an alliance, Solera wrote a libretto, entitled "Oberto, Conte di San Bonifacio," to which Verdi composed the music. The first performance of "Oberto" was given at La Scala on the evening of November 17, 1839, and the work was received with so much favor that Merelli, who was then the *impresario* of the house, bound Verdi by contract to supply him with three additional operas. If Merelli had stipulated that the novelties were to be *opere serie*, the result would have been more felicitous for both manager and artist. Unluckily he did not, and one of the few failures of Verdi's art life was the consequence. For some occult reason he chose an old libretto by Felice Romani that one Gyrowetz had already set to music, and addressed himself to the task of furnishing it with a score. The current of the composer's talent never lay in the direction of *opera buffa* or *mezzo carattere* music, and circumstances made his attempt to produce comic music more hopeless still. While busy with his new work an event occurred that almost broke his heart and unsettled his reason. His beloved wife was stricken down with brain fever, and after a few days' illness she died, leaving the composer in a condition more easily imagined than described. Though beside himself with grief, he had to finish the opera he had begun, and it will be generally conceded that, under the

influence of such a misfortune, the production of music of a light order was out of the question. "Un Giorno di Regno," under which title the fresh setting of "Il finto Stanislao" was made known at La Scala on September 5, 1840, had a memorable downfall; it proved, to use an Italian term, *un fiasco d'una sera*.

The failure of "Un Giorno di Regno" was a sad blow to Verdi's aspirations. After the death of his wife, and before the first representation of his second opera, he had resolved upon renouncing dramatic composition, and, in fact, his distress was so acute that his sole apparent desire was to seek solitude and oblivion. The ill-success of his latest achievement strengthened his decision to cease writing for the stage, and, after the withdrawal of "Un Giorno" from the boards, he waited upon Merelli and asked to be released from his contract. The fiasco of "Un Giorno" had been attended with so much *éclat* that it seemed hard to realize that the *impresario* would refuse to grant the composer's request. He did so, however, and it was only after a long discussion that he consented not to enforce the obligation. "Be it as you will," said Merelli at last. "I cancel the agreement; but remember, should you ever change your mind, my house is always open to you, and on the same terms as formerly." The grateful musician grasped Merelli's hand and pressed it warmly. Then he hastened home, gave orders to sell all his furniture except the Viennese piano that his wife was wont to play upon, and started for Busseto, where he took up his abode with his brother-in-law, and for a few months lived in melancholy contemplation of the past.

None of Verdi's associates expressed the slightest astonishment when, before the year was at an end, they met him again in Milan. The dull life of Busseto was scarcely suited to a man used to the feverish stir and stimulating tumult of a great city; and although Verdi proposed to devote himself wholly to teaching, he yearned for the inspiring impressions of metropolitan scenes. But he clung to his determination not to write for the stage, and Merelli's hints and entreaties went for a long time unheeded. Chance turned out the motive power that urged him to action. One evening, when about to look in at La Scala for a few minutes, he encountered Merelli. "I was just thinking of you," was the *impresario's* greeting. "Come into my office." Verdi followed him, and Merelli proceeded to explain that, requiring a libretto for Nicolai, he had charged Solera with writing it, but that Nicolai had declared the libretto unmusical and generally worthless, and had returned it. "I am not quite ignorant on these subjects," continued Merelli, "and I confess I do not

share the composer's opinion; still, as I do not propose to pay Solera for valueless work, I should like your judgment. Will you oblige me by glancing at the libretto?"

"Certainly," was the answer.

Verdi took the book, entered the auditorium, exchanged a few words with an acquaintance, and then walked home. He promptly set about fulfilling the promise made to Merelli, and, opening Solera's libretto, began to read it. Struck by the grandeur of the Biblical story chosen by the poet, tempted by the opportunities it held out to a composer, and carried away by the pathetic and forceful situations that unfolded themselves in quick succession, he finally wrought himself into a sort of fever, under the spell of which he seated himself at the piano and improvised a score, adapting the melodies, as he progressed, to Solera's verses, and keeping to the task until dawn made the lamp burn dim and the last scene of the opera was reached. The impression produced by the perusal of "Nabucco" was profound, and proved to be durable; but it was unrevealed by word or look when the musician, that same afternoon, called upon Merelli.

"Here," said he, "is Solera's libretto. I find it excellent, and am much astonished that Nicolai should not have recognized its worth."

"If so it be," was Merelli's reply, "we can come to an understanding. Nicolai having declined to set the book to music, I have sent him another, on which he is now engaged. As 'Nabucco' pleases you, take it home, write your score, and when it is finished we shall bring it out at La Scala."

"No, no," said Verdi; "you know very well that I shall not compose any more music for the stage."

"You are a child," retorted Merelli; "here is 'Nabucco,' and to work!"

Verdi yielded to Merelli's affectionate pleading, and, silencing the scruples that had kept him idle for a year, he commenced wedding Solera's words to his own inspired themes. While thus engaged Nicolai completed the score of the libretto intrusted to him by Merelli. But the composer of "Il Proscritto" was no luckier with this opera than Verdi had been with "Un Giorno," and it turned out one of the noisiest failures recorded in the annals of La Scala. Merelli, of course, was most anxious to produce Verdi's work, which was finished in a few months. Only one obstacle lay in the path of success — the fact that the choral forces of La Scala were rather limited in numbers. Merelli declined to increase their force, whereupon one Pasini, a well-known *dilettante*, offered to defray the expense of a supplementary chorus. Verdi proudly rejected

the offer and assumed the responsibility of some additional engagements himself. In other respects Merelli was sufficiently liberal, and the scenery and costumes were quite new. It was agreed between the composer and the manager that the amount to be paid for the right of publishing the score should be divided between them.

The success of the opera began with the earliest rehearsals. During their progress, if the chroniclers are to be trusted, the theater was in a state of revolution. The style of the music was so novel, its progress, as illustrative of the action of the drama, so swift and powerful, and its tone-color so brilliant, as to excite wonder and enthusiasm. The demonstrations of approval that attended the final rehearsals were insignificant in comparison with the incidents of the first performance of the opera. An ancient custom, still adhered to in those days, made it incumbent on the composer to sit in the orchestra, between the principal violoncellist and the principal double-bass player, nominally for the purpose of turning the leaves of the music placed before these humble *confrères*, but in reality to stand or fall, in person, with his work. On March 9, 1842, when Verdi took his seat beside the first 'cello, this man, Merighi, the instructor of the world-renowned Piatti, said: "*Maestrino*, I wish I were in your place to-night!" His good opinion of the composer's chances of success was not exaggerated. The applause was frequent and tremendous, and the finale of the first act, especially, called forth a display of frenzied delight such as northern readers can scarcely realize. Of the artists that took part in the representation of "Nabucco" only two need be mentioned in this notice, Giorgio Ronconi and Signorina Strep-poni. The great baritone was then in the zenith of his fame, and his superb voice and matchless histrionic talent must have contributed largely to the impressiveness of the opera. Signorina Strep-poni, whose artistic career extended over a few seasons only, would hardly be remembered for her achievements, but is not likely to be forgotten in her latest *rôle*, that of the composer's wife. She married Verdi a few years after the production of "Nabucco," and quitted the stage long before her youth had vanished.

The success of "Nabucco" placed Verdi on a plane with Donizetti, Mercadante, Pacini, and Ricci; and on the evening of the third representation of the new work he was summoned into the managerial office and formally notified that he had been chosen to write the opera for the *gran stagione di carnevale*. Fifteen months elapsed, and "I Lombardi" was brought forth, with Mme.

Frezzolini in the leading character. The Archbishop of Milan, Cardinal Gaisruk, endeavored to prevent the representation of the work, arguing that certain portions of the libretto were sacrilegious; but the chief of police, Torresani by name, looked into the matter and took the risk of allowing the curtain to rise upon "I Lombardi," which had its first hearing on February 11, 1843, and was received, as expected, with great favor. The musician's next victory was won in the Teatro della Fenice in Venice on March 9, 1844, when "Ernani" was given. The libretto, founded upon Hugo's play, was supplied by the poet Francesco Maria Piave, a writer of no marked skill, but a dramatist of sufficient cleverness and pliability to carry out the composer's instructions. Piave, who subsequently wrote the libretti of "Rigoletto," "La Traviata," and half a dozen other operas, sank in due course into a sort of literary slavery. His pride became wholly subservient to the musician's plans and whims, and criticisms as to the lack of dignity involved in continual self-sacrifice were invariably met with the answer, in the local dialect: "*El mestre vol cussi e basta.*" In respect of "Ernani" and most of his other achievements, the *maestro's* judgment, be it noted, was correct, and the first-named work was as enthusiastically greeted in Venice as was "Nabucco" in Milan.

It would be impossible, however, to bring within the limits of this article a record even of the thousand and one incidents that attended the early performances of the twenty-seven operas which Italy's great composer has made known to the world. The scope of this notice renders it necessary to make the merest mention of each successive production, and to dwell with like brevity on the more important events of the musician's art existence. "I Due Foscari," given in 1844 at the Teatro dell' Argentina in Rome, was only moderately successful, and "Giovanna d' Arco," brought out at La Scala on February 15, 1845, though more favored, produced a rather mild impression in Milan, and a somewhat unsatisfactory one whenever it was sung elsewhere. "Alzira," at the San Carlo in Naples, and "Attila," at La Fenice, were no more fortunate than "Giovanna," and "Macbeth," listened to at the Pergola in Florence in 1847, was coolly received. The last-named opera, recast as to libretto and score, was essayed at the Théâtre Lyrique in Paris in 1865, and fared no better than in its youth. Some of its preceding performances in Italy, however, created no little excitement. It was given at La Fenice in Venice just before the revolution of 1848. Palma, a Spanish tenor and a great Liberal, stepped forth in the third act and sang the

famous air "La patria tradita," embodying the appeal of a betrayed land for freedom from her oppressors. Palma bore a tri-colored cockade in his hat, and his delivery of the verses and music was so impassioned that the public, in the words of Kean, rose at him, joined in the chorus, and gave vent to "seditions" cries. The Government feared that the aria might be the spark that would fire the mine, and matters assumed so alarming an aspect that the interference of the royal grenadiers was finally sought and order temporarily restored. It was not known then, and probably few persons are even now aware, that the words of "La patria tradita" were written by Andrea Maffei, one of the most accomplished of Italian *litterati*, whom critics christened the "honey-tongued poet," and whose translations of Milton and Moore are accounted among the happiest efforts of the kind. How marked the contrast between Maffei's lines and the turgid and conventional "lengths" of Piave may be observed by the least analytical reader of the libretto. Meantime Verdi's fame had traveled from Italy to France, and from France to England, whence a commission for an opera ultimately reached him. "I Masnadieri," founded upon Schiller's "Die Räuber," was its fruit, and the work was brought forth at Her Majesty's Theatre in London on July 25, 1847. It was listened to with attention, but coldly, and subsequent performances in Italy were received quite as indifferently. "Il Corsaro," founded upon Byron's "Corsair," and performed at Trieste in October, 1848, and "La Battaglia di Legnano," given in Rome in January, 1849, were also unsuccessful, though the opportuneness of some of the situations of the latter opera caused its first representations to elicit considerable applause. Better fortune was in store for Verdi's next achievement. He had engaged to enrich the San Carlo in Naples with a new opera, and "Luisa Miller" was in readiness in the fall of 1849. Verdi started for Naples to conduct the rehearsals, and at this stage of events his troubles commenced. "Alzira," sung at the San Carlo four years previous, had failed to please, and the composer's Neapolitan friends, with the native superstition strong upon them, lay the blame of the *fiasco* upon the "evil eye" of the composer Capecelatro, who was regarded as a *jettatore* of the very first water, and whose approach was dreaded accordingly by every right-minded Neapolitan. As soon as Verdi reached Naples and was settled at the Hôtel de Russie, his intimates and admirers, to prevent the possibility of a meeting with Capecelatro, stood guard over him, telling themselves off in watches, and doing sentry duty at his door day and night.

ORIGINAL SCORE OF "IL TROVATORE."

"'La Traviata' last night was a failure. Am I at fault, or are the singers? Time will decide." As a matter of fact, the first act was applauded, but the remainder of the opera was listened to in unbroken silence. The unfitness of the artists for their work seems to have been the chief cause of the *fiasco*. Signora Donatelli was altogether too healthy a *Violetta*; Signor Graziani, the *Alfredo*, was frightfully hoarse, and Signor Varesi, the baritone, is reported to have considered his rôle so far beneath his merits as to have persistently slighted it, both in respect of action and singing. The music, too, was so different in style from that which these persons were used to interpret that they failed to endow it with the requisite tone-color and accent. And, finally, the eye was wearied by a monotonous succession of men and women in the somber garments constituting modern attire; for "La

Traviata" was not then performed with dresses of the period of Louis XIII., but in the garb of the nineteenth century. Only a twelvemonth was needed to bring about the composer's revenge. "La Traviata" was revived at another theater in Venice a year afterwards, with a slightly abridged score, with new artists, and with scenic costume similar to that in use nowadays. The verdict of the audience reversed the opinion expressed at La Fenice in 1853, and ever since "La Traviata" has held a prominent place in the *répertoire* of the leading opera-houses of the civilized world.

Space is wanting, as observed already, for minute particulars concerning the production of each of Verdi's works. His "Vêpres Siciliennes," composed on a libretto by Scribe and Duveyrier, in view of the Paris exhibition of 1855, was sung with success in the French capital on June 13th of that year; "Simone Boccanegra" was unsuccessful in Venice in 1857. Possibly Piave, whose librettos are not to be commended for conspicuous dramatic or literary worth, should have been held responsible for more than his usual share of the joint task, one of Verdi's most impartial commentators declaring that he had to read through the libretto six

times before he could make out its purport. Then came a revised edition of "Stiffelio," under the title of "Aroldo," and in 1859, at the Teatro Apollo in Rome, "Un Ballo in Maschera," touching the performance of which a few details must be supplied. It was originally intended for the San Carlo Theater. Verdi was in Naples and about to commence rehearsals, when, on January 13, 1858, news of Orsini's attempt upon the life of the Emperor Napoleon was received. The police became more vigilant than ever, and the censors were so fearful of creating an excitement that they immediately refused to license the representation of "Un Ballo." After the abortive conspiracy in Paris it was deemed impolitic to depict upon the stage the murder of a king, and it must be remembered that the libretto of the new work was founded upon the story of Gustavus

III., by Scribe, the Swedish monarch not having yet been transformed into "Ricardo Warwick, Governor of Boston." The Neapolitan *impresario* besought the composer to adapt his music to a new plot; the musician obstinately refused to accede to the request. The whole population sided with Verdi, who would at once have quitted Naples for good, but for the fact that the management held him to his contract to produce a new opera. At length a compromise was agreed upon, and Verdi, having bound himself to write another score as soon as practicable, was allowed to depart for Rome, where the board of censors, after compelling the composer to change the historical personages into the purely mythical characters now introduced, sanctioned the production of "Un Ballo." It was sung in the presence of a most enthusiastic audience at the Apollo Theater, on the evening of February 17, 1859.

Between 1859 and the present year Verdi has written but three operas, all of which have been composed in fulfillment of commissions for opera-houses on foreign soil: "La Forza del Destino," in deference to a command from the Court of St. Petersburg; "Don Carlos," in execution of an order from the Paris Opera-House; and "Aïda," by command of the Viceroy of Egypt. The plot of "La Forza" was taken by Piave from a Spanish drama entitled "Don Alvar," which a third of a century ago was received with applause in Madrid. The success of the play, however, did not insure the success of the opera, and "La Forza" was a disappointment. So was "Don Carlos," given at the Paris Opera-House on March 11, 1867, and listened to by the Imperial Court and an audience of exceptional brilliancy. Verdi's ultra admirers insist to this day that the dissatisfaction expressed by the Empress Eugénie at the allusions to the priesthood chilled the enthusiasm of the imperial household, and naturally reacted upon the public; but the cause of the comparative failure of the work was, by general consent, to be sought in the somber coloring and labored style of the music.

"Aïda" is to be numbered among the rare efforts that have been successful in spite of being put forth, so to speak, "to order." A new Italian opera-house had just been built in Cairo, and the Khedive, Ismaïl Pasha, applied to Verdi, asking his terms for an opera to be written upon a libretto provided with a national subject. The musician demanded four thousand pounds sterling, and six thousand if his presence was required to conduct the rehearsals. The proposal was accepted, and a sketch of the plot of the libretto, suggested

by Mariette Bey, the celebrated Egyptian scholar, sent to Verdi for his approval. Subsequently Ghislanzoni wrote out the libretto, to which, by the way, the composer himself added the powerful scene of *Radames's* trial, in the third act. When the opera was in readiness Verdi was requested to direct the rehearsals. His dread of the sea led him to decline the invitation,—in spite of which fact the Khedive generously paid him the full sum of six thousand pounds,—and Signor Bottesini was chosen to occupy the conductor's desk. The scenery and costumes were making in Paris, on designs from Mariette Bey, when the Franco-Prussian war broke out, and the *matériel*, stored in the beleaguered city, had to remain there until peace was declared. The first representation of "Aïda" was thus deferred a full twelvemonth beyond the date originally decided upon. It took place, at last, on the 24th of December, 1871. From the dress-rehearsal, which was held on the evening of the 23d, and lasted from half-past seven o'clock until half-past three in the morning, it was feared that the first hearing would have to be postponed once more; but the Khedive would brook no further delay, and on the next evening everything went well. "Aïda" was completely successful. Its production at La Scala, in Milan, six weeks later, gave birth to one of those enthusiastic demonstrations of approval that are never witnessed outside of Italy. Since the production of "Aïda" only one comparative novelty bearing Verdi's name has come before the public. This was in shape of a *rifacimento* of his early "Simone Boccanegra," and was well received in Italy and, if we are not mistaken, in Spain. The baritone Maurel, whom English and American audiences have not forgotten, was elected by the composer to represent the principal personage of the opera.

Even in Italy one can find detractors of Verdi, though very few, I imagine, are notable for the frankness and business talent of one Signor Prospero Bertani. "Aïda," it appears, was sung in Parma early in May, 1872. On May 8th Verdi received from Reggio, dated May 7th, the following curious epistle:

"SIGNOR VERDI GENTILISSIMO:

"On the 2d instant I proceeded to Parma, attracted thither by the celebrated opera 'Aïda,' and half an hour before the curtain rose I occupied seat No. 120, expecting much of the entertainment. I admired the *mise en scène*, listened with great pleasure to the artists, and endeavored to lose nothing. After the opera I inquired of myself whether I was satisfied, and received a negative answer. I returned to Reggio, and in the railway carriage hearkened to the passengers' opinions; all were agreed that 'Aïda' was a great opera. Then I determined to hear it anew, and on the 4th instant journeyed to Parma again and tried hard to get along without a seat, but was finally compelled, on

account of the crush, to pay five *lire* for a stall, whence I watched the performance with comfort. Afterwards I came to the conclusion that no number in the opera awakes enthusiasm or electrifies, that without spectacular incidents it would never be permitted to come to a finish, and that, after having been given in two or three theaters, it will be consigned to the dust of the archives. Now, my dear Verdi, you cannot imagine how vexed I am at having expended on these two occasions thirty-two *lire*, and especially when I remember that I am dependent upon my family for support: the money laid out assumes the shape of horrible specters and disturbs my peace of mind. Hence I look to you for speedy reimbursement of my outlay. My account is as below:

Railway — One trip to Parma.....	L. 2.60
“ Return.....	3.30
Seat at Theater.....	8.00
Wretched Supper at Station.....	2.00
<hr/>	
Same trip, repeated.....	15.90
	15.90
Total.....	L. 31.80

“I hope you will relieve my annoyance, and in this belief, salute you, heartily,
“BERTANI.
“Address, Bertani Prospero, Via S. Domenico, N. 5.”

The astonishment of Verdi when he received this epistle may be imagined; however, he thought fit to look into the matter, and wrote to Signor Ricordi to have his banker at Reggio pay Signor Bertani—if such a person was in existence—the sum of L. 27.80. “I am aware that this is not the entire amount he claims,” added the *maestro*, “but as for paying for his supper at the station—oh no! He might have had supper at home.” And he concludes: “Be it understood that you are to take a receipt for the money, and also a small memorandum, by the terms of which Signor Bertani engages not to hear any of my new operas; he will thus avoid the visitation of specters and spare me the necessity of paying additional traveling expenses.” Ricordi wrote to Reggio, and to his astonishment discovered that Bertani was no imaginary being, and that he was in sober earnest. In due season Verdi was handed the document of which a translation follows, and the story was brought to a close:

“REGGIO, May 15, 1872.

“The undersigned declares having received from *il maestro* G. Verdi L. 27.80 in full reimbursement of two trips to Parma to listen to ‘Aida,’ the composer of which opera thinks fit I should be repaid for the journeys, I not having found the work to my liking. It is also understood that I shall not again hear any new operas by the *maestro* Verdi, save at my own expense, whatever my judgment as to their merits.
(Signed) “BERTANI PROSPERO.”

The list of Verdi's productions, in addition to the operas referred to already, includes a “Messa da Requiem,” written in 1873 in memory of Alessandro Manzoni, one part of a “Hymn of Nations” (the three other divi-

sions of which were written by Meyerbeer, Auber, and Sterndale Bennett), executed in London in 1862, an instrumental quartet, and a number of songs.

Thus much attention having been given to the musician's achievements, something should be said in relation to the man. He figured in politics for a few years, but rather through willingness to lend the brilliancy of his name to a representation of Italy's prominence in art, than with any other object. His fellow-citizens of Busseto, however, thought differently; when the duchy of Parma sought annexation to Italy, they remembered that Verdi had always been a Liberal, that he never went to court, and that he avoided meeting the Austrian residents. So they sent him to the Chamber of Deputies. After this honor was conferred upon him, Verdi was somewhat embarrassed as to his position, and Count Cavour's proposal to have him elected to the first Italian Parliament distressed him considerably. “I know you are not a politician,” said Cavour, “but I desire that all men who have won distinction in the world of Italian art, science, or literature should meet in our first Parliament.” Verdi was elected, of course, and served two or three years before resigning. In spite of his aversion to public life, King Victor Emmanuel appointed him a senator in 1875. His name will go down to posterity in connection with the political history of Italy, for, in addition to adorning the rolls of the Senate, it was used in 1859 and 1860 as a national rallying-cry and symbol during the Italian struggle for freedom. In those troublous days it was treason, naturally, to shout, “Viva Victor Emmanuele, Rè d' Italia,” and when some phrase was sought as a sort of password and battle-shout, the people discovered that by writing and crying “Viva Verdi!” they gave utterance, in regular succession, to the initial letters of the forbidden sentence.

Verdi seldom leaves his native land. “L'amore del campanile,” as the Italians put it (“the love of the steeple”), is as strong in him now as in his boyhood. He generally passes the winter in Genoa, and the summer at his splendid country-house of Sant' Agata, not far from Busseto. The estate stands almost in solitude in the center of a vast plain; a church and two or three peasants' houses being the only buildings in proximity to the *maestro's* dwelling. The surroundings are not at all picturesque. The soil is under thorough cultivation, but the well-tilled fields have no charm for the eye, and the long rows of poplars and the shallow brook babbling beside them are totally devoid of poetic or pictorial suggestiveness. The visitor comes suddenly upon two weeping-willows, and, beyond, a row of close-

planted trees half conceals a simple dwelling from the glance of the passer-by. Beyond the house a fine garden extends down to a small artificial lake. The *maestro* usually writes in his bedroom, situated on the ground floor and looking out upon the garden. The apartment is furnished with artistic profusion; a magnificent piano, a library, a massive inkstand, numberless sketches, statuettes, vases, and knick-knacks, court and repay inspection. Above the piano hangs an oil-painting of the aged Barezzi, Verdi's earliest friend and Mæcenæas, whose memory he still reveres.

The composer is an early riser. At Sant' Agata he is stirring at five in the morning. After the habitual cup of black coffee he takes a stroll in the garden. Then he rambles through the fields and gives orders to his gardener, previous to visiting the stables and barn-yard. In a couple of hours one stroke upon a bell summons him to a cup of *café au lait*, partaken of with his wife. At half-past ten the bell sounds again, and this time a more substantial meal, to be followed by a game of billiards or a long walk, is shared. The letter-carrier is due at two o'clock, and with his appearance the one hour of excitement of the day is welcomed. What with reading and writing five o'clock is soon at hand, and dinner is served. Then the composer indulges in a ride, and the evening is whiled away in conversation. At ten Verdi sets an example of early retirement; he disappears, and everybody does likewise.

At Busseto Verdi is fairly worshiped. The inhabitants once made up their minds that he ought to write an opera and have it performed on the spot, in order to raise funds for building a theater. The *maestro* did not view the matter in the same light, but expended ten thousand *lire* upon the construction of a local opera-house, which bears over its portico the name "Teatro Verdi." Among the memories of his childhood that Busseto most jealously preserves, one of special interest is placed in the dwelling of the Barezzis. Here it was that Verdi lived until 1849, when he bought Sant' Agata, a sorry place in those days, in comparison with the present domain. Through the care of Signor Demetrio Barezzi, a son of Verdi's old friend, the composer's room is in the same condition as when he occupied it, and the custodian shows it with pride to the sight-seeing tourist. If Verdi were to revisit the place, he would experience little difficulty in recognizing its every nook and corner. The familiar spirit of the house, however, would hardly recognize the man. As a youth the composer was pale and thin, with sunken

cheeks and eyes; the Verdi of the present is tall, powerful, and as cordial and robust in manner as he was taciturn and feeble in years gone by.

Time and space are both wanting for even a hasty estimate of the part Verdi's music has played in the musical history of the century. Whether, in driving from the field the gentle strains of Cimarosa and Paisiello, in counter-acting what Scudo calls the "debilitating irony" of Rossini's writings, and in swaying the attentive masses by appealing to their senses rather than to their imagination and intellect, he has contributed as largely to the growth of taste as a more skilled and thoughtful musician endowed with the same splendid creative faculty might have done, are questions that must remain open for discussion. In spite of his easy victories over audiences in a land where the listener goes into ecstasies over one fine *cantabile* phrase, and in which a single solo and a single duet will save an opera from oblivion, Verdi has not disregarded the ever-widening influence of German thought; and if he has not aimed at conciliating the disciples of pure Wagnerism, he has at least sought to free his later works from the absurdities characterizing many of his earliest achievements. In "La Forza del Destino," in "Don Carlos," and especially in "Aïda," he has shown a desire to make his scores something more than collections of ballads and dance-themes; and in none of his mature efforts does the student happen upon the vulgar and saltatorial measures of which some of the choruses in "Ernani" may be cited as frightful examples. As a creative composer he stands without a rival. No one since Rossini has possessed the gift of melody and natural tone-color in so remarkable a degree, and the poorest of his operas would enrich for life, as to themes, any of the over-ambitious and hard-working — after the fashion of the mosaic-makers of Venice — successful composers of modern France, Italy, and Germany. As to the future, Verdi's admirers need entertain no apprehensions. In half a century hence the complex civilization of the age may render "Tristan and Isolde" musical food for infants, while the Verdian *répertoire* will seem as remote as Lulli's and Monteverde's operas now appear. But some noble monuments of the composer's matchless powers will surely remain. Just as the sestet from "Lucia" will never pass away, so will the quartet from "Rigoletto" and the "Miserere" from "Il Trovatore" endure for many ages, and move millions of listeners to passion and to tears.

Frederick A. Schwab.

TROUBLE ON LOST MOUNTAIN.

HERE is no doubt that when Miss Babe Hightower stepped out on the porch, just after sunrise one fine morning in the spring of 1876, she had the opportunity of enjoying a scene as beautiful as any that nature offers to the human eye. She was poised, so to speak, on the shoulder of Lost Mountain, a spot made cheerful and hospitable by her father's industry, and by her own inspiring presence. The scene, indeed, was almost portentous in its beauty. Away above her the summit of the mountain was bathed in sunlight, while in the valley below the shadows of dawn were still hovering — a slow-moving sea of transparent gray, touched here and there with silvery reflections of light. Across the face of the mountain that lifted itself to the skies a belated cloud trailed its wet skirts, revealing, as it fled westward, a panorama of exquisite loveliness. The fresh, tender foliage of the young pines, massed here and there against the mountain-side, moved and swayed in the morning breeze until it seemed to be a part of the atmosphere, a pale-green mist that would presently mount into the upper air and melt away. On a dead pine a quarter of a mile away, a turkey-buzzard sat with wings outspread to catch the warmth of the sun, while far above him, poised in the illimitable blue, serene, almost motionless, as though swung in the center of space, his mate overlooked the world. The wild honeysuckles clambered from bush to bush, and from tree to tree,

mingling their faint, sweet perfume with the delicious odors that seemed to rise from the valley, and float down from the mountain to meet in a little whirlpool of fragrance in the porch where Miss Babe Hightower stood. The flowers and the trees could speak for themselves; the slightest breeze gave them motion; but the majesty of the mountain was voiceless; its beauty was forever motionless. Its silence seemed more suggestive than the lapse of time, more profound than a prophet's vision of eternity, more mysterious than any problem of the human mind.

It is fair to say, however, that Miss Babe Hightower did not survey the panorama that lay spread out below her, around her, and above her with any peculiar emotions. She was not without sentiment, for she was a young girl just budding into womanhood, but all the scenery that the mountain or the valley could show was as familiar to her as the fox-hounds that lay curled up in the fence-corners, or the fowls that crowed and clucked and cackled in the yard. She had discovered, indeed, that the individuality of the mountain was impressive, for she was always lonely and melancholy when away from it; but she viewed it, not as a picturesque affair to wonder at, but as a companion with whom she might hold communion. The mountain was something more than a mountain to her. Hundreds of times, when a little child, she had told it her small troubles, and it had seemed to her that the spirit of comfort dwelt somewhere near the precipitous summit. As she grew older the mountain played a less important part in her imagination, but she continued to regard it with a feeling of fellowship which she never troubled herself to explain or define.

Nevertheless, she did not step out on the porch to worship at the shrine of the mountain, or to enjoy the marvelous picture that nature presented to the eye. She went out in obedience to the shrilly uttered command of her mother —

"Run, Babe, run! That pleggèd old cat's a-tryin' to drink out'n the water-bucket. Fling a cheer at 'er! Sick the dogs on 'er."

The cat, understanding the situation, promptly disappeared when it saw Babe, and

the latter had nothing to do but make such demonstrations as are natural to youth, if not to beauty. She seized one of the many curious crystal formations which she had picked up on the mountain and employed for various purposes of ornamentation, and sent it flying after the cat. She threw with great strength and accuracy, but the cat was gone. The crystal went zooming into the fence-corner, where one of the hounds lay, and this sensitive creature, taking it for granted that he had been made the special object of attack, set up a series of loud yells by way of protest. This aroused the rest of the dogs, and in a moment that particular part of the mountain was in an uproar. Just at that instant a stalwart man came around the corner of the house. He was bareheaded and wore neither coat nor vest. He was tall and well made, though rather too massive to be supple. His beard, which was full and flowing, was plentifully streaked with gray. His appearance would have been strikingly ferocious but for his eyes, which showed a nature at once simple and humorous—and certainly the strongly molded, square-set jaws and the firm lips needed some such pleasant corrective.

"Great Jerusalem, Babe!" cried this mild-eyed giant. "What could 'a' possessed you to be a-chunkin' ole Blue that away? Ag'in' bullaces is ripe you'll git your heart sot on 'possum, an' whar' is the 'possum comin' from ef ole Blue's laid up? Blame my hide ef you ain't a-cuttin' up some mighty quare capers for a young gal."

"Why, Pap!" exclaimed Babe, as soon as she could control her laughter, "that rock didn't tetch ole Blue. He'ssechamake-believe, I'm a great mind to hit him a clip jest to show you how he can go on."

"Now don't do that, honey," said her father. "Ef you want to chunk anybody, chunk me. I kin holler lots purtier'n ole Blue. An' ef you don't want to chunk me chunk your mammy fer ole acquaintance sake. She's big an' fat."

"Oh, Lordy!" exclaimed Mrs. Hightower from the inside of the house. "Don't set her atter me, Abe—don't, fer mercy's sake. Get her in the notion, an' she'll be a-yerkin' me aroun' thereckly like I wuz a rag-baby. I'm a-gittin' too ole fer ter be romped aroun' by a great big double-j'inted gal like Babe. Projick wi' er yourself, but make 'er let me alone."

Abe turned and went around the house again, leaving his daughter standing on the porch, her cheeks glowing and her black eyes sparkling with laughter. Babe loitered on the porch a moment, looking into the valley. The gray mists had lifted themselves into the upper

air, and the atmosphere was so clear that the road leading to the mountain could be followed by the eye, save where it ran under the masses of foliage; and it seemed to be a most devious and versatile road, turning back on itself at one moment only to plunge boldly forward the next. Nor was it lacking in color. On the levels it was of dazzling whiteness, shining like a pool of water, but at points where it made a visible descent, it was alternately red and gray. Something or other on this variegated road attracted Miss Babe's attention, for she shaded her eyes with her hand and leaned forward. Presently she cried out:

"Pap!—oh, Pap! there's a man a-ridin' up Peevy's Ridge."

This information was repeated by Babe's mother, and in a few moments the porch, which was none too commodious, though it was very substantial, was occupied by the entire Hightower family, which included Grandsir Hightower, a white-haired old man, whose serenity seemed to be borrowed from another world. Mrs. Hightower herself was a stout, motherly-looking woman, whose whole appearance betokened contentment, if not happiness. Abe shaded his eyes with his broad hand and looked towards Peevy's Ridge.

"I reckon may be it's Tuck Peevy hisse'f," Mrs. Hightower remarked.

"That's who I 'lowed hit wuz," said Grandsir Hightower, in the tone of one who had previously made up his mind.

"Well, I reckon I ought to know Tuck Peevy," exclaimed Babe.

"That's so," said Grandsir Hightower. "Babe oughter know Tuck. She oughter know him certain an' shore; bekaze he's bin a-floppin' in an' out er this house ever' Sunday fer mighty nigh two year'. Some sez he likes Babe, an' some sez he likes Susan's fried chicken. Now, in my day and time——"

"He's in the deen, now," said Babe, interrupting her loquacious grandparent, who threatened to make some embarrassing remark. "He's a-ridin' a gray."

"He's a mighty early bird," said Abe, "less'n he's a headin' fer the furdur side. May be he's a revenue man," he continued. "They say they're a-gwine to heat the hills mighty hot from this on."

"You hain't got nothing gwine on down on the branch, is you, Abe?" inquired Grandsir Hightower, with pardonable solicitude.

"Well," said Abe, evasively, "I hain't kindled no fires yit, but you better b'lieve I'm a-gwine to keep my beer from sp'ilin'. The way I do my countin', one tub of beer is natchally wuth two revenue chaps."

By this time the horseman who had attracted Babe's attention came into view again. Abe studied him a moment and remarked:

"That hoss steps right along, an' the chap a-straddle of him is got on store-clo'es. Fetch me my rifle, Babe. I'll meet that feller half-way an' make some inquirements about his famerly, an' may be I'll fetch a squirl back."

With this Abe called to his dogs and started off.

"Better keep your eye open, Pap," cried Sis. "May be it's the sheriff."

Abe paused a moment and then pretended to be hunting a stone with which to demolish his daughter, whereupon Babe ran laughing into the house. The allusion to the sheriff was a stock joke in the Hightower household, though none of them made such free use of it as Babe, who was something more than a privileged character, so far as her father was concerned. On one occasion shortly after the war, Abe had gone to the little county town on business, and had been vexed into laying rough hands on one of the prominent citizens who was a trifle under the influence of liquor. A warrant was issued, and Dave McLendon, the sheriff of the county, a stumpy little man, whose boldness and prudence made him the terror of criminals, was sent to serve it. Abe, who was on the lookout for some such visitation, saw him coming, and prepared himself. He stood in the doorway, with his rifle flung carelessly across his left arm.

"Hold on thar, Dave!" he cried, as the latter came up. The sheriff, knowing his man, halted.

"I hate to fling away my manners, Dave," he went on, "but folks is gittin' to be mighty funny these days. A man's obleeged to s'arch his best frien's 'fore he kin find out the'r which-aways. Dave, what sort of a dockymment is you got ag'in' me?"

"I got a warrant, Abe," said the sheriff pleasantly.

"Well, Dave, hit won't fetch me," said Abe.

"Oh, yes!" said the sheriff. "Yes it will, Abe. I bin a-usin' these kind er warrants a mighty long time, an' they fetches a feller every whack."

"Now, I'll tell you what, Dave," said Abe, patting his rifle, "I got a dockymment here that'll fetch you a blame sight quicker'n your dockymment'll fetch me; an' I tell you right now, plain an' flat, I hain't a-gwine to be drug aroun' an' slapped in jail."

The sheriff leaned carelessly against the rail fence in the attitude of a man who is willing to argue an interesting question.

"Well, I tell you how I feel about it, Abe," said the sheriff, speaking very slowly. "You

kin shoot me, but you can't shoot the law. Bang away at me, an' thar's another warrant atter you. This yer one what I'm already got don't amount to shucks, so you better fling on your coat, saddle your horse, an' go right along wi' me thes ez neighborly ez you please."

"Dave," said Abe, "if you come in at that gate you er a goner."

"Well, Abe," the sheriff replied, "I 'lowed you'd kick; I know what human natur' on these hills is, an' so I thes axed some er the boys to come along. They er right down thar in the holler. They hain't got no mo' idea what I come fer'n the man in the moon; yit they'd make a mighty peart posse. Tooby shore, a great big man like you ain't afeard fer ter face a little bit er law."

Abe Hightower hesitated a moment, and then went into the house. In a few minutes he issued forth and went out to the gate where the sheriff was. The faces of the two men were a study. Neither betrayed any emotion nor alluded to the warrant. The sheriff asked after the "crap," and Abe told him it was "middlin' peart," and asked him to go into the house and make himself at home until the horse could be saddled. After a while the two rode away. Once during the ride Abe said:

"I'm mighty glad it wa'n't that feller what run ag'in you last fall, Dave."

"Why?" asked the sheriff.

"Bekaze I'd 'a' plugged him, certain an' shore," said Abe.

"Well," said the sheriff, laughing, "I wuz a-wishin' mighty hard thes about that time that the t'other feller had got 'lected."

The warrant amounted to nothing, and Abe was soon at home with his family, but it suited his high-spirited daughter to twit him occasionally because of his tame surrender to the sheriff, and it suited Dave to treat the matter good-humoredly.

Abe Hightower took his way down the mountain, and about two miles from his house, as the road ran, he met the stranger who had attracted Babe's attention. He was a handsome young fellow, and he was riding a handsome horse—a gray, that was evidently used to sleeping in a stable where there was plenty of feed in the trough. The rider also had a well-fed appearance. He sat his horse somewhat jauntily, and there was a jocund expression in his features very pleasing to behold. He drew rein as he saw Abe, and gave a military salute in a careless, off-hand way that was in strict keeping with his appearance.

"Good-morning, sir," he said.

"Howdy?" said Abe.

"Fine day this."

"Well, what little I've saw of it is purty tollerbul."

The young fellow laughed, and his laughter was worth hearing. It had the ring of youth in it.

"Do you chance to know a Mr. Hightower?" he asked, throwing a leg over the pommel of the saddle.

"Do he live anywhere aroun' in these parts?" Abe inquired.

"So I'm told."

"Well, the reason I ast," said Abe, leaning his rifle against a tree, "is bekaze they mought be more'n one Hightower runnin' loose."

"You don't know him, then?"

"I know one on 'em. Any business wi' him?"

"Well, yes — a little. I was told he lived on this road. How far is his house?"

"Well, I'll tell you," — Abe took off his hat and scratched his head, — "some folks mought take a notion hit wuz a long ways off, an' then, ag'in, yuther folks mought take a notion that hit wuz lots nigher. Hit's accordin' to the way you look at it."

"Is Mr. Hightower at home?" inquired the young stranger, regarding Abe with some degree of curiosity.

"Well," said Abe, cautiously, "I don't reckon he's right slam bang at home, but I lay he ain't fur off."

"If you happen to see him, pray tell him there's a gentleman at his house who would like very much to see him."

"Well, I tell you what, mister," said Abe, speaking very slowly. "You're a mighty nice young feller, — anybody kin shet the'r eyes and see that, — but folks 'roun' here is mighty kuse; they is that away. Ef I wuz you, I'd thes turn right 'roun' in my tracks 'n' let that ar Mr. Hightower alone. I wouldn't pester wi' 'im. He hain't no fitten company fer you."

"Oh, but I must see him," said the stranger. "I have business with him. Why, they told me down in the valley that Hightower, in many respects, is the best man in the county."

Abe smiled for the first time. It was the ghost of a smile.

"Shoo!" he exclaimed. "They don't know him down thar nigh as good as he's know'd up here. An' that hain't all. Thish yer Mister Hightower you er talkin' about is got a mighty bad case of measles at his house. You'd be ableezde to ketch 'em ef you went thar."

"I've had the measles," said the stranger.

"But these here measles," persisted Abe, half shutting his eyes and gazing at the young man steadily, "kin be cotched twice-t. Theyer wuss'n the small-pox — lots wuss."

"My dear sir, what do you mean?" the young man inquired, observing the significant emphasis of the mountaineer's language.

"Hit's thes like I tell you," said Abe.

"Looks like folks has mighty bad luck when they go a-rippitin' hether an' yan on the mounting. It hain't been sech a monst'us long time sence one er them revenue fellers come a-paradin' up thish yer same road, a-makin' inquirements for Hightower. He cotch the measles; bless you, he took an' cotch 'em by the time he got in hailin' distance of Hightower's, an' he had to be toted down. I disremember his name, but he wuz a mighty nice-lookin' young feller, peart an' soople, an' thes about your size an' weight."

"It was no doubt a great pity about the revenue chap," said the young man sarcastically.

"Lor', yes!" exclaimed Abe, seriously; "lots er nice folks must 'a' cried about that man."

"Well," said the other, smiling, "I must see Hightower. I guess he's a nicer man than his neighbors think he is."

"Shoo!" said Abe, "he hain't a bit nicer'n what I am, an' I lay he hain't no purtier. What mought be your name, mister?"

"My name is Chichester, and I'm buying land for some Boston people. I want to buy some land right on this mountain if I can get it cheap enough."

"Jesso," said Abe, "but wharbouts in thar do Hightower come in!"

"Oh, he knows all about the mountain, and I want to ask his advice and get his opinions," said Chichester.

Something about Mr. Chichester seemed to attract Abe Hightower. Perhaps it was the young fellow's fresh, handsome appearance; perhaps it was his free-and-easy attitude, suggestive of the commercial tourist, that met the approbation of the mountaineer. At any rate, Abe smiled upon the young man in a fatherly way and said:

"'Twixt you an' me an' yon pine, you hain't got no fuder to go fer to strike up wi' Hightower. I'm the man you er atter."

Chichester regarded him with some degree of amazement.

"My dear sir," he exclaimed, "why should you desire to play the sphinx?"

"Spinks?" said Abe, with something like a grimace; "the Spinks famerly lived fuder up the mounting, but they er done bin weeded out by the revenue men too long ago to talk about. The ole man's in jail in Atlanty er some'rs else, the boys is done run'd off, an' the gal's a trollop. No Spinks in mine, cap', ef you please!"

Chichester laughed at the other's earnestness. He mistook it for drollery.

"I let you know, cap'," Abe went on, "you can't be boss er your own doin's an' give ever' passin' man your name."

"Well, I'm very glad to meet you," said Chichester heartily; "I'll have a good deal of business in this neighborhood first and last, and I'm told there isn't anything worth knowing about the mountain that you don't know."

"That kind er talk," Abe replied, "kin be run in the groun', yit I hain't a-denyin' but what I've got a kind er speakin' acquaintance wi' the neighborhood whar I'm a-livin' at.

mountain was so bracing that he felt as if he could fast a week and still fatten.

"Well, sir," Abe remarked, "hit's mighty little we er got to offer, an' that little's mighty common, but, sech as 'tis, you er more'n welcome. Hit's diffunt wi' me when the mornin' air blows at me. Hit makes me wanter nibble at somepin'. I dunner whar you come from, an' I ain't makin' no inquirements, but down

"I RECKON BREAKFAST WILL BE READY."

Ef you er huntin' my house, thes drive right on. I'll be thar ag'in you git thar."

Chichester found a very cordial welcome awaiting him when he arrived at Hightower's house. Even the dogs were friendly, and the big cat came out from its hiding-place to rub against his legs as he sat on the little porch.

"By the time you rest your face an' han's," said Abe, "I reckon breakfast'll be ready."

Chichester, who was anxious to give no trouble, explained that he had had a cup of coffee at Peevy's before starting up the mountain. He said, moreover, that the

in these parts you can't spat a man harder betwixt the eyes than to set back an' not break bread wi' 'im."

Mr. Chichester had been warned not to wound the hospitality of the simple people among whom he was going, and he was quick to perceive that his refusal to "break bread" with the Hightowers would be taken too seriously. Whereupon, he made a most substantial apology—an apology that took the shape of a ravenous appetite, and did more than justice to Mrs. Hightower's fried chicken, crisp biscuits, and genuine coffee.

Mr. Chichester also made himself as agreeable as he knew how, and he was so pleased with the impression he made that he, on his side, admitted to himself that the Hightowers were charmingly quaint, especially the shy girl of whom he caught a brief glimpse now and then as she handed her mother fresh supplies of chicken and biscuits.

There was nothing mysterious connected with the visit of Mr. Chichester to Lost Mountain. He was the agent of a company of Boston capitalists who were anxious to invest money in Georgia marble quarries, and Chichester was on Lost Mountain for the purpose of discovering the marble beds that had been said by some to exist there. He had the versatility of a modern young man, being something of a civil engineer and something of a geologist; in fine, he was one of the many "general-utility" men that improved methods enable the high schools and colleges to turn out. He was in the habit of making himself agreeable wherever he went, but behind his levity and general good humor there was a good deal of seriousness and firmness of purpose.

He talked with great freedom to the Hightowers, giving a sort of commercial coloring, so to speak, to the plans of his company with respect to land investments on Lost Mountain; but he said nothing about his quest for marble.

"The Lord send they won't be atter fetchin' the railroad kyars among us," said Grandsir Hightower fervently.

"Well, sir," said Chichester, "there isn't much danger."

"Now, I dunno 'bout that," said the old man querulously, "I dunno 'bout that. They're gittin' so these days they'll whirl in an' do e'enamost anything what you don't want 'em to do. I kin stan' out thar in the hoss-lot any cle'r day an' see the smoke er their engines, an' sometimes hit looks like I kin hear 'em snort an' cough. They er plenty nigh enough. The Lord send they won't fetch 'em no nigher. Fum Giner'l Jackson's time plump tell now, they er bin a-fetchin' destruction to the country. You'll see it. I mayn't see it myself, but you'll see it. Fust hit was Giner'l Jackson an' the bank, an' now hit's the railroad kyars. You'll see it!"

"And yet," said Chichester, turning towards the old man, as Hope might beam benignantly on the Past, "everybody and everything seems to be getting along very well. I think the only thing necessary now is to invent something or other to keep the cinders out of a man's eyes when he rides on the railroads."

"Don't let 'em fool you," said the old man earnestly. "Ever'thing's in a tangle, an' ther'

hain't no Whig party for to ontangle it. Giner'l Jackson an' the cussid bank is what done it."

Just then Miss Babe came out on the little porch and seated herself on the bench that ran across one end. "Cap'," said Abe, with some show of embarrassment, as if not knowing how to get through a necessary ceremony, "this is my gal, Babe. She's the oldest and the youngest. I'm name' Abe an' she's name' Babe, sort er rhymin' like."

The unaffected shyness of the young girl was pleasant to behold, and if it did not heighten her beauty, it certainly did not detract from it. It was a shyness in which there was not an awkward element, for Babe had the grace of youth and beauty, and conscious independence animated all her movements.

"'Ceppin' me an' the ole 'oman," said Abe, "Babe is the best-lookin' one er the famerly."

The girl reddened a little, and laughed lightly with the air of one who is accustomed to give and take jokes, but said nothing.

"I heard of Miss Babe last night," said Chichester, "and I've got a message for her."

"Wait!" exclaimed Abe, triumphantly; "I'll bet a hoss I kin call the name 'thout movin' out'n my chair. Hold on!" he continued. "I'll bet another hoss I kin relate the message word for word."

Babe blushed violently, but laughed good-humoredly. Chichester adjusted himself at once to this unexpected informality, and allowed himself to become involved in it.

"Come, now!" he exclaimed, "I'll take the bet."

"I declare!" said Mrs. Hightower, laughing, "you all oughtn' to pester Babe that away."

"Wait!" said Abe. "The name er the man what sont the word is Tuck Peevy, an' when he know'd you was a-comin' here, he sort er sidled up an' ast you for to please be so good as to tell Miss Babe he'd drap in nex' Sunday, an' see what her mammy is a-gwine ter have for dinner."

"Well, I have won the bet," said Chichester. "Mr. Peevy simply asked me to tell Miss Babe that there would be a singing at Philadelphia camp-ground Sunday. I hardly know what to do with two horses."

"May be you'll feel better," said Abe, "when somebody tells you that my hoss is a mule. Well, well, well!" he went on. "Tuck didn't say he was comin', but I be boun' he comes, an' more'n that, I be boun' a whole passel er gals an' boys'll foller Babe home."

"In giner'ly," said Grandsir Hightower, "I hate for to make remarks 'bout folks when they hain't settin' whar they kin hear me, but that ar Tuck Peevy is got a mighty bad eye."

I hearn 'im a-quollin' wi' one er them Simmons boys las' Sunday gone wuz a week, an' I tell you he's got the Ole Boy in 'im. An' his appetite's wuss'n his eye."

"Well," said Mrs. Hightower, "nobody 'roun' here don't begrudge him his vittles, I reckon."

"Oh, by no means — by no manner er means," said the old man, suddenly remembering the presence of Chichester. "Yit they oughter be reason in all things; that's what I say — reason in all things, speshually when hit comes to gormandizin'."

The evident seriousness of the old man was very comical. He seemed to be possessed by the unreasonable economy that not infrequently seizes on old age.

"They hain't no begrudin' 'roun' here," he went on. "Lord! ef I'd 'a' bin a-begrudin' I'd 'a' thes natchally bin e't up wi' my begrudges. What wer' the word the poor creetur sent to Babe?"

Chichester repeated the brief and apparently uninteresting message, and Grandsir Hightower groaned dismally.

"I dunner what sot him so ag'in' Tuck Peevy," said Abe, laughing. "Tuck's e'en about the peartist chap in the settlement, an' a mighty handy man, put 'im whar you will."

"Why, Aberham!" exclaimed the old man, "you go on like a man what's done gone an' took leave of his sev'm senses. You dunner what sot me ag'in' the poor creetur? Why, time an' time ag'in' I've tol' you it's his ongodly hankerin' atter the flesh-pots. The Bible's ag'in' it, an' I'm ag'in' it. Wharbouts is it put down that a man is ever foun' grace in the cubberd?"

"Well, I lay a man that works is boun' ter eat," said Abe.

"Oh, I hain't no 'count, — I can't work," said the old man, his wrath, which had been wrought to a high pitch, suddenly taking the shape of plaintive humility. "Yit 'tain't for long. I'll soon be out'n the way, Aberham."

"Shoo!" said Abe, placing his hand affectionately on the old man's shoulder. "You er mighty nigh as spry as a kitten. Babe, honey, fill your grandsir's pipe. He's a-missin' his mornin' smoke."

Soothed by his pipe, the old man seemed to forget the existence of Tuck Peevy, and his name came up for discussion no more.

But Chichester, being a man of quick perceptions, gathered from the animosity of the old man, and the rather uneasy attitude of Miss Babe, that the discussion of Peevy's appetite had its origin in the loyer-like attentions which he had been paying to the girl. Certainly Peevy was excusable, and if his attentions had been favorably received, he was to

be congratulated, Chichester thought, for in all that region it would have been difficult to find a lovelier specimen of budding womanhood than the young girl who had striven so unsuccessfully to hide her embarrassment as her grandfather proceeded, with the merciless recklessness of age, to criticise Peevy's strength and weakness as a trencherman.

As Chichester had occasion to discover afterwards, Peevy had his peculiarities, but he did not seem to be greatly different from other young men to be found in that region. One of his peculiarities was that he never argued about anything. He had opinions on a great many subjects, but his reasons for holding his opinions he kept to himself. The arguments of those who held contrary views he would listen to with great patience, even with interest, but his only reply would be a slow, irritating smile and a shake of the head. Peevy was homely, but there was nothing repulsive about his homeliness. He was tall and somewhat angular; he was sallow; he had high cheekbones, and small eyes that seemed to be as alert and as watchful as those of a ferret; and he was slow and deliberate in all his movements, taking time to digest and consider his thoughts before replying to the simplest question, and even then his reply was apt to be evasive. But he was good-humored and obliging, and, consequently, was well thought of by his neighbors and acquaintances.

There was one subject in regard to which he made no concealment, and that was his admiration for Miss Babe Hightower. So far as Peevy was concerned, she was the one woman in the world. His love for her was a passion at once patient, hopeful, and innocent. He displayed his devotion less in words than in his attitude; and so successful had he been that it was generally understood that by camp-meeting time Miss Babe Hightower would be Mrs. Tuck Peevy. That is to say, it was understood by all except Grandsir Hightower, who was apt to chuckle sarcastically when the subject was broached.

"They hain't arry livin' man," he would say, "what's ever seed anybody wi' them kind er eyes settled down an' married. No, sirs! Hit's the vittles Tuck Peevy's atter. Why, bless your soul an' body! he thes natchally dribbles at the mouth when he gits a whiff from the dinner-pot."

Certainly no one would have supposed that Tuck Peevy ever had a sentimental emotion or a romantic notion, but Grandsir Hightower did him great injustice. Behind his careless serenity he was exceedingly sensitive. It is true he was a man difficult to arouse; but he was what his friends called "a mighty tetchy man" on some subjects, and one of these

BABE FOLLOWED HIM TO THE GATE, AND STOOD LOOKING AFTER HIM." (SEE PAGE 434.)

subjects was Babe. Another was the revenue men. It was generally supposed by Peevy's acquaintances on Lost Mountain that he had a moonshine apparatus over on Sweetwater; but this supposition was the result, doubtless, of his well-known prejudice against the deputies sent out to enforce the revenue laws.

It had been the intention of Chichester to remain only a few days in that neighborhood, but the Hightowers were so hospitably inclined, and the outcroppings of minerals so interesting, that his stay was somewhat prolonged. Naturally, he saw a good deal of Peevy, who knew all about the mountain, and who was frequently able to go with him on his little excursions when Abe Hightower was otherwise engaged. Naturally enough, too, Chichester saw a great deal of Babe. He was interested in her because she was young and

beautiful, and because of her quaint individuality. She was not only unconventional, but charmingly so. Her crudeness and her ignorance seemed to be merely phases of originality.

Chichester's interest in Babe was that of a studiously courteous and deferent observer, but it was jealously noted and resented by Tuck Peevy. The result of this was not at first apparent. For a time Peevy kept his jealous suggestions to himself, but he found it impossible to conceal their effect. Gradually he held himself aloof, and finally made it a point to avoid Chichester altogether. For a time Babe made the most of her lover's jealousy. After the manner of her sex, she was secretly delighted to discover that he was furious at the thought that she might inadvertently have cast a little bit of a smile at Mr.

Chichester, and on several occasions she heartily enjoyed Peevy's angry suspicions. But after a while she grew tired of such inconsistent and foolish manifestations. They made her unhappy, and she was too vigorous and too practical to submit to unhappiness with that degree of humility which her more cultivated sisters sometimes exhibit.

One Sunday afternoon, knowing Chichester to be away, Tuck Peevy sauntered carelessly into Hightower's yard and seated himself on the steps of the little porch. It was his first visit for several days, and Babe received him with an air of subdued coolness and indifference that did credit to her sex.

"Wharbouts is your fine gent this mornin'?" inquired Peevy, after a while.

"Wharbouts is who?"

"Your fine gent wi' the sto'-clo'es on."

"I reckon you mean Cap'n Chichester, don't you?" inquired Babe innocently.

"Oh, yes!" exclaimed Peevy; "he's the chap I'm a-makin' my inquiresments atter."

"He's over on Sweetwater, I reckon. Least-ways thar's whar he started to go."

"On Sweetwater. Oh, yes!" Peevy paused and ran his long slim fingers through his thin straight hair. "I'm mighty much afear'd," he went on after a pause, "that that fine gent o' your'n is a-gwine ter turn out for to be a snake. That's what I'm afear'd un."

"Well," said Babe, with irritating coolness, "he don't do any of his sneakin' aroun' here. Ef he sneaks, he goes some'ers else to sneak. He don't hang aroun' an' watch his chance to drap in an' pay his calls. I reckon he'd walk right in at the gate thar ef he know'd the Gov'nor er the State wuz a-settin' here. I'm mighty glad I hain't saw none er his sneakin'."

Peevy writhed under this comment on his own actions, but said nothing in reply.

"You don't come to see folks like you use-ter," said Babe, softening a little. "I reckon you er mighty busy down thar wi' your craps."

Peevy smiled until he showed his yellow teeth. It was not intended to be a pleasant smile.

"I reckon I come lots more'n I'm wanted," he replied. "I hain't got much sense," he went on, "but I got a leetle bit, an' I know when my room's wuth more'n my comp'ny."

"Your hints has got more wings'n stings," said Babe. "But ef I had in my min' what you er got in yourn —"

"Don't say the word, Babe!" exclaimed Peevy, for the first time fixing his restless eyes on her face. "Don't!"

"Yes, I'll say it, Tuck," said Babe solemnly. "I oughter 'a' said it a long time ago when you wuz a-cuttin' up your capers bekaze Phli Varnadoe wuz a-comin' here to see Pap. I oughter 'a' said it then, but I'll say it now,

right pine-blank. Ef I had in my min' what you er got in yourn, I wouldn't never darken this door no more."

Peevy rose and walked up and down the porch. He was deeply moved, but his face showed his emotion only by a slight increase of sallowness. Finally he paused and looked at Babe.

"I lay you'd be mighty glad ef I didn't come no more," he said, with a half smile. "I reckon it kinder rankles you for to see old Tuck Peevy a-hangin' roun' when the tother feller's in sight."

Babe's only reply was a scornful toss of the head.

"Oh, yes!" Peevy went on, "hit rankles you might'y; yit I lay it won't rankle you so much atter your daddy is took an' jerked off to Atlanty. I tell you, Babe, that ar man is one er the revenues — they hain't no two ways about that."

Babe regarded her angry lover seriously.

"Hit ain't no wonder you make up your min' ag'in' him when you er done made it up ag'in' me. I know in reason they must be some'n' 'nother wrong when a great big grown man kin work hisself up to holdin' spite. Goodness knows, I wish you wuz like you userter be when I fust know'd you."

Peevy's sallow face flushed a little at the remembrance of those pleasant, peaceful days, but, somehow, the memory of them had the effect of intensifying his jealous mood.

"'Taint me that's changed aroun'," he exclaimed passionately, "an' 'tain't the days nuther. Hit's you — you! An' that fine gent that's a-hangin' roun' here is the 'casion of it. Ever'whar I go hit's the talk. Babe, you know you er lovin' that man!"

Peevy was wide of the mark, but the accusation was so suddenly and so bluntly made that it brought the blood to Babe's face — a tremulous flush that made her fairly radiant for a moment. Undoubtedly Mr. Chichester had played a very pleasing part in her youthful imagination, but never for an instant had he superseded the homely figure of Tuck Peevy. The knowledge that she was blushing gave Babe an excuse for indignation that women are quick to take advantage of. She was so angry, indeed, that she made another mistake.

"Why, Tuck Peevy!" she cried, "you shorely must be crazy. He wouldn't wipe his feet on sech as me!"

"No," said Peevy, "I 'lowed he wouldn't, an' I 'lowed as how you wouldn't wipe your feet on me." He paused a moment, still smiling his peculiar smile. "Hit's a long ways down to Peevy, ain't it?"

"You er doin' all the belittlin'," said Babe.

"Oh, no, Babe! Ever'thing's changed.

Why, even them dogs barks atter me. Ever'-thing's turned wrongsud-outerds. An' you er changed wuss'n all."

"Well, you don't reckon I'm a-gwine ter run out'n the gate thar an' fling myself at you, do you?" exclaimed Babe.

"No, I don't. I've thes come to-day for to git a cle'r understandin'." He hesitated a moment and then went on: "Babe, will you marry me to-morrow?" He asked the question with more eagerness than he had yet displayed.

"No, I won't!" exclaimed Babe, "ner the nex' day nuther. The man I marry'll have a lots better opinion of me than what you er got."

Babe was very indignant, but she paused to see what effect her words would have. Peevy rubbed his hands nervously together, but he made no response. His serenity was more puzzling than that of the mountain. He still smiled vaguely, but it was not a pleasing smile. He looked hard at Babe for a moment, and then down at his clumsy feet. His agitation was manifest, but it did not take the shape of words. In the trees overhead two jays were quarreling with a cat-bird, and in the upper air a bee-martin was fiercely pursuing a sparrow-hawk.

"Well," he said, after a while, "I reckon I better be gwine."

"Wait till your hurry's over," said Babe, in a gentler tone.

Peevy made no reply, but passed out into the road, and disappeared down the mountain. Babe followed him to the gate, and stood looking after him, but he turned his head neither to the right nor to the left, and in a little while she went into the house with her head bent upon her bosom. She was weeping.

Grandsir Hightower, who had shuffled out on the porch to sun himself, stared at the girl with amazement.

"Why, honey!" he exclaimed, "what upon the top side er the yeth ails you?"

"Tuck has 'gone home mad, an' he won't never come back no more," she cried.

"What's the matter wi' im?"

"Oh, he's thes mad along er me."

"Well, well, well!" exclaimed the old man, fumbling feebly in his pockets for his red bandanna handkerchief, "what kind of a come-off is this? Did you ast him to stay to dinner, honey?"

"No — no; he didn't gimme a chance."

"I 'lowed you didn't," exclaimed Grandsir Hightower triumphantly. "I thes natchally 'lowed you didn't. That's what's riled 'im. An' now he'll go off an' vilify you. Well, well, well! he's missed his dinner! The first time in many's the long day. Watch 'im, Babe! Watch 'im, honey! The Ole Boy's in

'im. I know 'im; I've kep' my two eyes on 'im. For a mess er turnip-greens an' dumperlin's that man 'ud do murder." The old man paused and looked all around as if by that means to dissipate a suspicion that he was dreaming. "An' so Tuck missed his dinner! Tooby shore — tooby shore!"

"Oh, hit ain't that," cried Babe; "he's jealous of Cap'n Chichester."

"Why, the good Lord, honey! what makes you run on that away?"

"He tol' me so," said Babe.

"Jealous!" exclaimed Grandsir Hightower, "jealous er that young feller! Merciful powers, honey! he's a-begrudgin' 'im the vittles what he eats. I know'd it the minnit I seed 'im come a-sa'-nterin' in the yard. Lord, Lord! I wish in my soul the poor creetur could git a chance at one er them ar big Whig barbecues what they useter have."

But there was small consolation in all this for Babe, and she went into the house, where her forlorn appearance attracted the attention of her mother.

"Why, Babe! what in the worl'!" exclaimed this practical woman, dropping her work in amazement. "What in the name er sense ails you?"

Babe had no hesitation in telling her mother the facts.

"Well, my goodness!" was Mrs. Hightower's comment, "I wouldn't go aroun' whinin' about it, ef I wuz you — that I wouldn't. Nobody never ketched me whinin' 'roun' atter your pappy 'fore we wuz married, an' he wuz lots purtier than what Tuck Peevy is. When your pappy got tetchy, I thes sez to myself, s'I, 'Ef I'm wuth havin', I'm wuth scramblin' atter,' an' ef your pappy hadn't 'a' scrambled an' scuffled 'roun' he wouldn't 'a' got me nuther, ef I do up an' say it myself. I'd a heap druther see you fillin' them slays an' a-fixin' up for to weave your pappy some shirts, than to see you a-whinin' 'roun' atter any chap on the top side er the yeth, let 'lone Tuck Peevy."

There was little consolation even in this, but Babe went about her simple duties with some show of spirit; and when her father and Chichester returned from their trip on Sweetwater, it would have required a sharp eye to discover that Babe regarded herself as "wearing the green willow."

For a few days she avoided Chichester, as if by that means to prove her loyalty to Peevy; but as Peevy was not present to approve her conduct or to take advantage of it, she soon grew tired of playing an unnecessary part. Peevy persisted in staying away, and the result was that Babe's anger—a healthy quality in a young girl—got the better of her grief. Then wonder took the place of anger;

but behind it all was the hope that before many days Peevy would saunter into the house, armed with his inscrutable smile, and inquire, as he had done a hundred times before, how long before dinner would be ready. This theory was held by Grandsir Hightower, but, as it was a very plausible one, Babe adopted it as her own.

Meanwhile, it is not to be supposed that two lovers, one sulking and the other sighing, had any influence on the season. The spring had made some delay in the valley before taking complete possession of the mountain, but this delay was not significant. Even on the mountain the days began to suggest the ardor of summer. The air was alternately warm and hazy, and crisp and clear. One day Kenesaw would cast aside its atmospheric trappings and appear to lie within speaking distance of Hightower's door. The next it would withdraw behind its blue veil, and seem far enough away to belong to another world. On Hightower's farm the corn was high enough to whet its green sabers against the wind.

One evening Chichester, Hightower, and Babe sat on the little porch with their faces turned toward Kenesaw. They had been watching a line of blue smoke on the mountain in the distance, and, as the twilight deepened into dusk, they saw that the summit of Kenesaw was crowned by a thin fringe of fire. As the darkness gathered, the bright belt of flame projected against the vast expanse of night seemed to belong to the vision of St. John.

"It looks like a picture out of the Bible," suggested Chichester, somewhat vaguely.

"It's wuss'n that, I reckon," said Abe. "Some un's a-losin' a mighty sight of fencin'; an' timber's timber these days, lemme tell you."

"May be some un's a-burnin' bresh," said Babe.

"Bless you! they don't pile bresh in a streak a mile long," said Abe.

The thin line of fire crept along slowly, and the people on the little porch sat and watched it. Occasionally it would crawl up to the top of a dead pine, and leave a fiery signal flaming in the air.

"What is the matter with Peevy?" asked Chichester after a while. "I met him on the mountain the other day, and he seemed not to know me."

"He don't know anybody aroun' here," said Babe with a sigh.

"Hit's thes some er his an' Babe's capers," Hightower remarked with a laugh. "They er bin a-cuttin' up this away now gwine on two year'. I reckon ag'in' camp-meetin' time Tuck'll drap in an' make hisself know'd. Gals and boys is mighty funny wi' the'r gwines on."

After a little, Abe went into the house and left the young people to watch the fiery procession in Kenesaw.

"The next time I see Peevy," said Chichester, gallantly, "I'll take him by the sleeve and show him the road to Beauty's bower."

"Well, you nee'n'ter pester wi' 'im on account of me," said Babe. Chichester laughed. The fact that so handsome a girl as Babe should deliberately fall in love with so lank and ungainly a person as Tuck Peevy seemed to him to be one of the problems that philosophers ought to concern themselves with; but, from his point of view, the fact that Babe had not gradually faded away, according to the approved rules of romance, was entirely creditable to human nature on the mountain.

A candle, burning in the room that Chichester occupied, shone through the window faintly and fell on Babe, while Chichester sat in the shadow. As they were talking a mocking-bird in the apple-trees awoke and poured into the ear of night a flood of delicious melody. Hearing this, Babe seized Chichester's hat and placed it on her head.

"There must be some omen in that," said Chichester.

"They say," said Babe, laughing merrily, "that ef a gal puts on a man's hat when she hears a mocker sing at night, she'll git married that year an' do well."

"Well, I'm sorry I haven't got a bonnet to put on," exclaimed Chichester.

"Oh, it don't work that away!" cried Babe.

The mocking-bird continued to sing, and finally brought its concert to a close by giving a most marvelous imitation of the liquid, silvery chimes of the wood-thrush.

There was a silence for one brief moment. Then there was a red flash under the apple-trees, followed by the sharp crack of a rifle. There was another brief moment of silence, and then the young girl sighed softly, leaned forward, and fell from her chair.

"What's this?" cried Abe, coming to the door.

"The Lord only knows!" exclaimed Chichester. "Look at your daughter!"

Abe stepped forward and touched the girl on the shoulder. Then he shook her gently; as he had done a thousand times when rousing her from sleep.

"Babe! git up! Git up, honey, an' go in the house. You ought to 'a' been abed long ago. Git up, honey."

Chichester stood like one paralyzed. For the moment he was incapable of either speech or action.

"I know what she's atter," said Abe, tenderly. "You wouldn't believe it skacely, but this yer great big chunk of a gal wants her

ole pappy to pick her up an' tote her thes like he useter when she was er little bit of a scrap."

"I think she has been shot," said Chichester. To his own ears his voice seemed to be the voice of some other man.

"Shot!" exclaimed Abe. "Why, who's a-gwine to shoot Babe? Lord, Cap'n! you dunner nothin' 'tall 'bout Babe ef you talk that away. Come on, honey." With that Abe lifted his child in his arms, and carried her into the house. Chichester followed. All his faculties were benumbed, and he seemed to be walking in a dream. It seemed that no such horrible confusion as that by which he was surrounded could have the remotest relation to reality.

Nevertheless, it did not add to his surprise and consternation to find, when Abe had placed the girl on her bed, that she was dead. A little red spot on her forehead, half-hidden by the glossy, curling hair, showed that whoever held the rifle aimed it well.

"Why, honey," said Abe, wiping away the slight blood-stain that showed itself, "you struck your head ag'in' a nail. Git up! you oughtn't to be a-gwine on this away before comp'ny."

"I tell you she is dead!" cried Chichester. "She has been murdered!"

The girl's mother had already realized this fact, and her tearless grief was something pitiful to behold. The gray-haired grandfather had also realized it.

"I'd druther see her a-lyin' thar dead," he exclaimed, raising his weak and trembling hands heavenward, "than to see her Tuck Peevy's wife."

"Why, gentermen!" exclaimed Abe, "how *kin* she be dead? I oughter to know my own gal, I reckon. Many's an' many's the time she's worried me, a-playin' 'possum, an' many's an' many's the time has I sot by her waitin' tell she let on to wake up. Don't you all pester wi' her. She'll wake up therreckly."

At this juncture Tuck Peevy walked into the room. There was a strange glitter in his eyes, a new energy in his movements. Chichester sprang at him, seized him by the throat, and dragged him to the bedside.

"You cowardly, skulking murderer!" he exclaimed, "see what you have done!"

Peevy's sallow face grew ashen. He seemed to shrink and collapse under Chichester's hand. His breath came thick and short. His long, bony fingers clutched nervously at his clothes.

"I aimed at the hat!" he exclaimed huskily.

He would have leaned over the girl, but Chichester flung him away from the bedside,

and he sank down in a corner, moaning and shaking. Abe took no notice of Peevy's entrance, and paid no attention to the crouching figure mumbling in the corner, except, perhaps, so far as he seemed to recognize in Chichester's attack on Peevy a somewhat vigorous protest against his own theory; for, when there was comparative quiet in the room, Hightower raised himself, and exclaimed, in a tone that showed both impatience and excitement:

"Why, great God A'mighty, gentermen, don't go on that away! They hain't no harm done. Thes let us alone. Me an' Babe's allright. She's bin a-playin' this away ev'ry sence she wuz a little bit of a gal. Don't less make her mad, gentermen, bekaze ef we do she'll take plum tell day attar to-morrer for to come 'roun' right."

Looking closely at Hightower, Chichester could see that his face was colorless. His eyes were sunken, but shone with a peculiar brilliancy, and great beads of perspiration stood on his forehead. His whole appearance was that of a man distraught. Here was another tragedy!

Seeking a momentary escape from the confusion and perplexity into which he had been plunged by the horrible events of the night, Chichester passed out into the yard, and stood bareheaded in the cool wind that was faintly stirring among the trees. The stars shone remote and tranquil, and the serenity of the mountain, the awful silence that seemed to be, not the absence of sound, but the presence of some spiritual entity, gave assurance of peace. Out there, in the cold air, or in the wide skies, or in the vast gulf of night, there was nothing to suggest either pity or compassion — only the mysterious tranquillity of nature.

This was the end, so far as Chichester knew. He never entered the Hightower house again. Something prompted him to saddle his horse and ride down the mountain. The tragedy and its attendant troubles were never reported in the newspapers. The peace of the mountain remained undisturbed, its silence unbroken.

But should Chichester, who at last accounts was surveying a line of railway in Mexico, ever return to Lost Mountain, he would find Tuck Peevy a gaunt and shrunken creature, working on the Hightower farm and managing such of its small affairs as call for management. Sometimes, when the day's work is over and Peevy sits at the fireside saying nothing, Abe Hightower will raise a paralytic hand and cry out as loud as he can that it's almost time for Babe to quit playing 'possum. At such times we may be sure that, so far as Peevy is concerned, there is still trouble on Lost Mountain.

Joel Chandler Harris.

SPIRITUAL PREACHING FOR OUR TIMES.

IN his address to the divinity students of Cambridge, Mr. Emerson says that Christianity has given us "two inestimable advantages." These are, "First, the Sabbath, the jubilee of the whole world; whose light dawns welcome alike into the closet of the philosopher, into the garret of toil, and into prison cells, and everywhere suggests, even to the vile, the dignity of spiritual being"; "and secondly, the institution of preaching,—the speech of man to men,—essentially the most flexible of all organs, of all forms."

These two institutions will stand or fall together. If the Christian Sabbath continues to suggest to all conditions of men "the dignity of spiritual being" instead of mere physical indulgence, it will be because the church and the pulpit, so associated in our minds with the Sabbath, have power to hold men to a sense of that dignity. The Christian pulpit and the Christian Sabbath will preach the same thing. To the minds of men the one will be what the other is. The heritage of a spiritual Sabbath cannot be long preserved after the pulpit has lost spiritual power. There are those who think that this day has already come. Mr. Emerson thought so forty-seven years ago. He was mistaken then; others are mistaken now. The truth is, that "the most flexible of all organs" shows, on the whole, great power of adaptation. The pulpit is, in the main, sensitive to popular needs, and it is not so very slow to respond to them. Now and then there will be such a man as Mr. Emerson saw standing in the pulpit one Sunday with the snow-flakes falling past the windows behind him, and the snow-flakes more real than he. But there has been any amount of reality in the pulpits for the past forty-seven years, and there is more and more of it instead of less and less. I suspect there have always been those to complain that the pulpit has lost, or is just about to lose, its hold on the people; but it never quite loses it. It always manages to begin to say the right thing before the last of the hearers has made up his mind to go to church no more. It may be seriously questioned whether, taking the people as they run, there was ever a time when popular interest in preaching, at least in this country, was greater than now. There is and always has been a large non-church-going element. But any one who watches the doors of our churches on Sunday, in city or village, will make up his mind that neither churches nor

pulpits have lost their attractions for the great "middle class" of society.

And any one who comes much in contact with these church-goers will observe that there has been among them, in the last ten or fifteen years, an increasing demand for preaching which befits and promotes a spiritual Sabbath and a spiritual faith. If, especially here in America, church-goers, at one period of this generation, have been, to a considerable extent, captivated by a preaching which lowered its tone, and thought to catch men with oddities and tricks of sensationalism, that day has gone by. You hear little of such things in these later years. For some reason taste has changed. Men are less in the mood for trifling. Congregations are more serious. There is a call for earnest work. There is a larger sense of the "dignity of spiritual being." There is a demand for a more spiritual preaching. It is rather felt than expressed in words; but it only needs defining and cultivating in order to open the way for the highest order of pulpit work. This demand corresponds to widespread intellectual and social conditions, involving problems over which men grow earnest. These conditions make the work of the pulpit more than usually attractive to the preacher, while the quality which preaching is to assume, in the face of such problems, becomes a matter of popular interest.

What then is Spiritual Preaching? It is not preaching with what, in many quarters, passes for unction. There is an unction without which a man had as well not preach. The preacher must come, as Jesus came from the Jordan, having the consciousness so transfused by a sense of spirit and spiritual relations, that he will speak out of soul-depths so profound that they seem to touch the sources of being. This is unction, though it does not always pass for it. What often goes current under the name is nothing more than an acquired manner and tone, belonging to the department of elocution, and equally available, if one please, for themes spiritual or secular.

It is well also not to confound spiritual preaching with revival preaching, to which belongs such discourse as is mainly intended to move men to sudden conversion, rather than to educate them into a large understanding of themselves and of their spiritual relations. Revival preaching has its function, but, as a main dependence, it cannot answer the

demand of any times. A good deal of it is materialistic and lacking in educational power. Spiritual preaching is reviving; it is not necessarily revivalistic. It aims to develop in man a sense of his spiritual nature and of the wants and possibilities of that nature. It would lift man into an ennobling conception of himself by revealing him to his own consciousness as a being of high origin, born for great enterprise in the triple realm of thought and feeling and action. It labors, broadly, to put man into spiritual relation to all his surroundings; to the universe of nature, to humanity as represented in the family, the community, the nation, and the race. Crowning all this is the revelation of man in his relation to an infinite spirit. This last the preacher must apprehend and set forth in the style of Jesus, as an exalting and saving relation. Here is the center at which spiritual preaching aims: to get man to know God, to bring him into contact with the Infinite, and bind him so close to it that the divine life shall throb through him, stimulate his growth, and shape it into the sympathy and manliness of Jesus.

This kind of preaching is spiritual. It deals with man as spirit, possessing, over and above all other relations, spiritual contacts with the world about him and above him; belonging to a great spiritual community under a heavenly Father. It lifts man out of mere earth and flesh in order to establish up and down the universe spiritual relations in which he finds his life.

Such preaching can scarcely fail to be cheerful and hopeful. He who engages in it will be in earnest because he deals with the deepest problems of humanity. He will warn men; but there will be a glow of heaven in his speech, since it is born out of a gospel which is lustrous with the glory from the midst of which it comes.

Now it is true that preaching of this kind is demanded at all times. The wants of the ages are more nearly the same than we are inclined to think. But, under a general persistence of the same needs, there are special developments of life in centuries, and even in decades, which have to be checked or stimulated or molded by forces at the preacher's command. For these purposes he must emphasize now one side and now another of gospel truth. As he does this he may become more or less spiritual in his emphasis. The doctrinal preaching of forty or more years ago was distinctively intellectual. When it dealt with spiritual things it sought to compass them with definitions and syllogisms. It subordinated them to system. Perhaps it needed to do so. It is well not to judge the past. We shall soon belong to it. The preaching of the early part of the century

must have had its antecedent conditions, which made it largely speculative and dogmatic. A man may deliver from his pulpit a system of theology, and though it lack spiritual flavor, it may meet a need of his time.

There are also periods which call for special emphasis on the ethical side of religion. The foundations of morality being already laid, for reasons arising out of widely existing conditions, the pulpits far and near may ring out the call to virtue and honesty. Conduct is the theme of discourse. Such a period was introduced in this country by the corruptions following in the wake of the late war. It is never safe to lose sight of ethical truth. It covers so much of human action that some mistake it for the whole of life. It is the manifestation of a life which roots deeper than conduct and of which conduct is the fruit.

Then too there is an unspiritual and secular preaching which easily degenerates into sensationalism, in the bad sense, and has had its day among us or is, in a lesser degree, still having its day. Such preaching may originate in a demand of the times not altogether unhealthy; as when men have come to feel that religion is a thing apart from life and alienated from the world's movements. Then the preacher may have to emphasize the sympathy of religion and the pulpit with the current affairs of the world. But woe to the man who, himself unspiritual, undertakes to do this. For out of this rational demand has come some very irrational preaching on topics of the times.

Now, in distinction from preaching emphatically doctrinal or ethical or secular or of whatever other sort, it is the object of this essay to present to the minds of both people and preachers the demand, arising out of present aspects of life, for a preaching emphatically spiritual; dealing with man on the side of his relations to a spiritual humanity and to a whole wide realm of spirit and of spirit-revealing nature.

The times present on the one hand a preparation and on the other a peculiar and growing need of this kind of preaching. Not that the people call for it with any distinct utterance. The wants of the masses of men are often unconscious. But those who sit in the pews are in a state of mind to listen to such truth, and they will encourage its proclamation. They will also go away from listening to it with responses in their hearts, forced by their experiences of a world-life in which they are taking part, but the bearings of which they do not perfectly comprehend. Some of the conditions of that life we must review.

Science, philosophy, theology, politics, in-

dustry are all offering just now marked phases. In science and philosophy we have reached the close of a period wherein great movements have made a preparation for spiritual preaching. In theology, politics, and industry powerful movements are rising to their flood which create a demand for such preaching.

The last forty years have witnessed rapid advancement in all departments of science, on the basis of wide and profound researches, culminating in generalizations which are mightily influencing all provinces of thought. These advances have covered a period of activity on which is following a period of relative rest from scientific speculation, though not from investigation. Those acquainted with Whewell's writings will recognize this as one of his periods of review, involving certification or rejection of speculative results.

Now, what here specially concerns us is the manifest spiritual tendency of all this scientific work. There never was a grosser mistake than that which any of us have committed, if we have stood trembling in our bats' corners, protesting against the boldness of scientific investigation or against the attempts of men of science to form comprehensive theories of nature, as though the universe might preach a gospel of materialism. For, now that the heats of controversy are being dissipated, it is plain that the whole drift of science for the last thirty or forty years has been toward a spiritual unity. This is indicated by multitudinous directions of discovery which point to one force center; as a thousand needles at a thousand different stations on this northern hemisphere point toward a pole whence all magnetic forces emanate. Moreover, as the mind expands its range of vision on the ever widening circle of generalization, it recognizes in the world of nature numerous thought-relations which point to spirit as that primal unity.

It was to be expected that along with the movements of science would come the revival of those philosophical problems which the human race is ever discussing in view of itself and the phenomena of nature. Once more, and with tremendous popular appeals, the questions of being and becoming, of whence and how and whither, have been brought forward. This discussion never ends. But we may discern here, also, just now, a period of relative repose, wherein results are garnered to the reassurance of man's belief in himself as spirit and in God as spirit, and in a community of spirit life around and above us. In the discussions of philosophy, positivism has been met by the necessary conception of causal power; materialism, in man and in the world external to man, has been met by

a philosophy of spirit; agnosticism has been met by reasserting the foundations of a true diagnosis, of knowledge grounded in the sure facts of human consciousness out of which, as from firm data, man rises to rational beliefs, and so the way is opened for the loftiest flights of a spiritual faith.

As a result of this readjustment, through a sound philosophy, of the questions started afresh by science, the preacher will find, in the coming years, not only among the common people, but among the learned, a stronger basis for his appeals to man as a spiritual being, living in spiritual relations. If, in the wrecks of faith, caused by the boldness of the questions and denials which have been pushed to the front in the last few decades, there has been, in certain classes of society, a drifting away from the sense of spiritual things, there are indications that the cyclone is past. Through a sweeter and serenest atmosphere heaven is opened again to human vision, and on its floor of sapphire is erected the throne of God. There has been no time in the last twenty or thirty years when the preacher could speak of spiritual things with so much boldness or with so great promise of a ready response. After such periods of questioning, men turn with hungry hearts to those realities which make life worth living.

On the other hand, tendencies of thought and life are rapidly developing, on a large scale, which make insistence upon the spiritual in religion a commanding necessity.

However opinions may differ as to the value of present tendencies in the theological world, no one will deny that there is a determined push in the direction of a larger freedom. Call it looseness or license or liberty, the fact is there, indisputable. With it we have to deal. The forces which have held men, whether of human authority backed by a persecuting ecclesiasticism, or of ignorance, or of both combined, are no longer sufficient to hold them. In the face of protests men go on asserting the liberty to inquire into all foundations of belief, whether in science, philosophy, or revelation. The nature and sources of authority are inspected. The claims of Scripture, theories of inspiration, former interpretations of Scripture, the historic foundations of Christianity, the life of Jesus and his work and their relation to individual destiny and race destiny, the innermost meaning of salvation, its scope and reach,—all are reviewed and discussed with intense interest, and with the enthusiasm and hope of a fresh liberty. It is useless to attempt the arrest of this. It is part of the life of the age. He is happiest who most clearly sees that freedom of inquiry is the condition of truth.

On the other hand, such freedom is not without its dangers; and the salvation of our present religious thought can only be assured, and healthful results reached, by baptizing that thought in the spirit. The more it feels the pulse of freedom the more thoroughly must it be pervaded by the sense of the invisible. If such movements are not intensely spiritual they become rationalistic and skeptical. A rank intellectualism is only a grade higher than materialism. It is the spirit that quickeneth. The Christian church is passing through great transitions. This is not a sign of decadence, but of an intense life. But change involves crises. Transition periods are critical periods. In guiding the great body of the church through such transitions, and, in order to land the people on a surer basis of faith, the preacher must keep to those spiritual heights where all things are seen in their divinely constituted relations.

If we pass over to the political conditions of our country and the world we shall find them joining in the demand for such preaching. The political emancipation of the masses, under whatever form of government; the recognition of manhood; the allotment to each of his share of privilege and responsibility; in a word, the doctrine of political equality is bearing the fruit of an intense individualism. Men easily confound political equality with equality of attainment; equal rights with equal worth. In political striving and climbing that grace of humility, which enjoins man "not to think of himself more highly than he ought to think," vanishes. In cultivating manhood we develop selfhood. Individualism, in the root idea of which lies great promise for character, becomes a rampant self-assertion, a hankering after an unattainable independence. It grows impatient of all superiority, whether in knowledge and refinement or in wealth and power. It runs into irreverence, disregard of authority, lawlessness, communism, nihilism, political iconoclasm joined to oicoclasm, the destruction of home. These are the thistles which grow in the rich but rank soil of political equality; and precisely here is to be cast in the good seed of a spiritual kingdom. Against these crude growths simple ethical teaching does not avail, least of all a materialistic ethics. Here he who aims to correct by laying the main emphasis upon ethics fails because the foundations of morality are swept away. The spiritual kingdom must first be made regnant, and out of it must grow a spiritual ethics. Into this whirl and swelter of political agitation the preacher must come charged with the sense of God and of the possibilities of a spiritual manhood. Individualism is to learn dependence on an infinite Father. Abnegation

of all authority is to be met by the authority of love in God's son. Irreverence is to be overcome by the spirit of worship, of which some of our churches are making too little. Oicoclasm is to yield before the spiritual unity of the home. Socialism must be supplanted by a more rational Christian communism, under the names of communion, fellowship, brotherhood.

Looking once more at industry, in its various departments of production and trade, we find here our third demand for emphasizing the spiritual side of life and for holding its activity in closer contact with the heavenly and divine.

Science has grandly stimulated industry by increasing its rewards. The prizes of enterprising labor are great, often glittering. The power of wealth is fascinating. The successful producer or dealer of to-day is a prince. The industrious laborer is rich. And the result of all this is that laziness is ceasing to be fashionable;—the nobility of England are learning to make themselves useful. Science sets the world astir. The goal of its motion is gain. The race is eager. Hence mammon-worship. Hence mercantilism, the inordinate estimate of wealth; the grading of all things at a value in cash; society graded on a cash basis; ideality sacrificed to material good; virtue, patriotism, heroism, manhood counting for less, money counting for more; votes, offices, justice having their price. This is mercantilism, the great danger to society; greater because more subtle than nihilism. It creeps into literature, science, art, politics, the state, the church; and here arises the demand for that spiritual teaching which fell from the lips of Jesus, the antidote for inordinate worldly care and worldly striving; the lofty view of a life which is more than meat; God coming in among the elements of this world, clothing lilies, feeding birds, summoning man to the glory of an ideal kingdom and to the attainment first and foremost of *character*, rooted in God and God's righteousness. The cure for the mercantile spirit is not ethics, but faith. It is not a moral code but the divine Fatherhood. It is not even the golden rule, except as the golden rule is formulated out of the spirit of Christian Brotherhood.

In bringing the discussion to this point I may seem only to have prepared the way for a demand that the contents of spiritual preaching should be given with some particularity; but it is only possible to touch such a matter in its roots. Details must develop themselves out of personal and local conditions.

We cannot, however, place too much emphasis on the requirement that the contents of

such a spiritual gospel be made up under the direct influence of the life and teaching of Jesus. His spirituality is preëminent. In others, even of the sacred writers, this quality is weighted with earthly admixtures. In him it is unalloyed, ethereal, and transparent. He lives in at once the richest and the most delicate relations to his environment. In contact with him all nature seems permeated with spirit. His intense spirituality transfigures his fleshly body, lifts him over waves, transports him into the clouds. It envelops his personality and gives it its singular radiance; it pervades his action and fills his speech. His discourse is neither secular nor ethical nor theological; it is spiritual. And what especially helps us in making up the root-contents of our preaching is the fact that this spirituality expresses itself in three fundamental conceptions, which shaped his life and formed the

substance of his doctrine. These are Fatherhood, Sonship, Brotherhood. Here are the relations in which he lived and of which he spoke. In unfolding them and in applying them to the needs of our times, the pulpit will develop its highest spiritual power. The golden future, too, of which men dream, is prophesied in these conceptions. No theology which is permeated with the truth of a divine Fatherhood as set forth by Jesus can become coldly rationalistic. Individualism cannot hold sway and develop its destructive social fruits among peoples that have caught the deeper meaning of Sonship and Brotherhood. The same conceptions, in their free development, are the antidote for mercantilism in its various forms, supplanting it by higher views of life, laying the foundation for ideal worth, for unselfish patriotism and philanthropic heroism.

Edward Hungerford.

THE SECOND BATTLE OF BULL RUN.*

PICKETING THE RAPIDAN.

EARLY in June, 1862, I was in command of the army corps known as the "Army of the Mississippi," which formed the left wing of the army engaged in operations against Corinth, Miss., commanded by General Halleck. A few days after

Corinth was evacuated

I went to St. Louis on a short leave of absence from my command, and while there I received a telegram from Mr. Stanton, Secretary of War, requesting me to come to Washington immediately. I at once communicated the fact to General Halleck by telegraph, and received a reply from him strongly objecting to my leaving the army under his command. I quite concurred with him both as to his objections to my going to Washington for public reasons and as to the unadvisability of such a step on personal considerations. I was obliged, however, to go, and I went accordingly, but with great reluctance and against the urgent protests of my friends in St. Louis, and subse-

quently of many friends in the Army of the West.

When I reached Washington, the President was absent at West Point, but I reported in person to Secretary Stanton. I had never seen him before, and his peculiar appearance and manners made a vivid impression on me. He was short and stout. His long beard, which hung over his breast, was slightly tinged with gray even at that time, and he had the appearance of a man who had lost much sleep and was tired both in body and mind. Certainly, with his large eye-glasses and rather disheveled appearance, his presence was not imposing. Although he was very kind and civil to me, his manner was abrupt and his speech short and rather dictatorial. He entered at once on the business in hand, seemingly without the least idea that any one should object to, or be reluctant to agree to, his views and purposes. He was surprised, and it seemed to me not well pleased, that I did not assent to his plans with effusion; but went on to unfold them in the seeming certainty that they must be submitted to. He informed me that the purpose was to unite the armies under McDowell, Frémont, and Banks, all three of whom were my seniors in rank, and to place me in general command. These armies were scattered over the northern part of Virginia, with little or no

* General Longstreet will contribute to the February CENTURY a paper on this subject, with illustrations.

Accompanying General Beauregard's paper on the

First Battle of Bull Run, or "Manassas" (see THE CENTURY for November, 1884), were maps and many pictures which will be found of interest with reference to the second battle.—EDITOR.

communication or concert of action with one another; Frémont and Banks being at Middletown, in the valley of the Shenandoah, and McDowell's corps widely separated, King's division being at Fredericksburg, and Ricketts's at and beyond Manassas Junction.

The general purpose at that time was to demonstrate with the army toward Gordonsville and Charlottesville and draw off as much as possible of the force in front of General McClellan, who then occupied the line of the Chickahominy, and to distract the attention of the enemy in his front so as to reduce as far as practicable the resistance opposed to his advance on Richmond.

It became apparent to me at once that the duty to be assigned to me was in the nature of a forlorn hope, and my position was still further embarrassed by the fact that I was called from another army and a different field of duty to command an army of which the corps commanders were all my seniors in rank. I therefore strongly urged that I be not placed in such a position, but that I be permitted to return to my command in the West, to which I was greatly attached and with which I had been closely identified in several successful operations on the Mississippi. It was not difficult to forecast the delicate and embarrassing position in which I should be placed, nor the almost certainly disagreeable, if not unfortunate, issue of such organization for such a purpose.

It would be tedious, and no doubt not interesting, to relate the conversations which took place between the President, the Secretary of War, and myself on this subject. It will be sufficient to say that I was finally informed that the public interests required my assignment to this command, and that it was my duty to submit cheerfully. An order from the War Department was accordingly issued organizing the Army of Virginia, to consist of the army corps of McDowell, Banks, and Frémont, and placing me in command.

One result of this order was the very natural protest of General Frémont against being placed under the command of his junior in rank, and his almost immediate request to be relieved from the command of his corps.

It was natural not only that the commanders of the three corps of the army should be dissatisfied with an organization in which they were subordinated to their junior in rank, but almost equally so that the subordinate officers and the enlisted men of those corps should have been ill pleased at the seeming affront to their own officers, involved in calling an officer strange to them and to the country in which they were operating, and to the character of the service in which they

were engaged, to supersede well-known and trusted officers who had been with them from the beginning, and whose reputation was so closely identified with their own.

How far this feeling prevailed among them, and how it influenced their actions, if it did so at all, I am not able to tell; but it is only proper for me to say (and it is a pleasure as well as a duty to say it) that Generals McDowell and Banks never exhibited to me the slightest feeling on the subject either in their conversation or acts. Indeed, I think it would be hard to find officers more faithful to their duty or more deeply interested in the success of the army. To General McDowell especially is due my gratitude for his zeal and fidelity in what was and ought to have been considered a common cause, the success of the Union army.

Knowing very well the difficulties and embarrassments certain to arise from all these sources, and the almost hopeless character of the service demanded of me, I, nevertheless, felt obliged, in deference to the wish of the President and Secretary of War, to submit; but I entered on this command with great reluctance and serious forebodings.

On the 27th of June, accordingly, I assumed command of the Army of Virginia, which consisted of the three corps above named, which numbered as follows: Frémont's corps, 11,500; Banks's corps, 8000; and McDowell's corps, 18,500; in all, 38,000 men. The cavalry numbered about 5000, but most of it was badly organized and armed, and in poor condition for service. These forces were scattered over a wide district of country, not within supporting distance of one another, and some of the brigades and divisions were badly organized and in a more or less demoralized condition. This was especially the case in the army corps of General Frémont, as shown in the report of General Sigel sent me when he had assumed command of it.

My first object was, therefore, to bring the three corps of the army together, or near enough together to be within supporting distance of one another, and to put them in as efficient a condition for active service as was possible with the time and means at my disposal. When I assumed this command, the troops under General Stonewall Jackson had retired from the valley of the Shenandoah to Richmond, so there was not at that time any force of the enemy of any consequence within several days' march of my command. I accordingly sent orders to General Sigel to move forward, cross the Shenandoah at Front Royal, and, pursuing the west side of the Blue Ridge, take post at Sperryville by passing the Blue Ridge at Luray or Thornton's

Gap. At the same time I directed General Banks to cross the Shenandoah at the same place and take post near or at Little Washington. Ricketts's division of McDowell's corps, then at and beyond Manassas Junction, was ordered to move forward to Waterloo Bridge, where the turnpike from Warrenton to Sperryville crosses the Rappahannock, there known as Hedgman's River. King's division of the same corps was kept at Fredericksburg in deference to the wishes of the Government and much against my opinion. The wide separation of this division from the main body of the army not only deprived me of its use when, as became plain afterwards, it was much needed, but left us exposed to the constant danger that the enemy might interpose between us.

The partial concentration of the corps so near to the Blue Ridge and with open communications with the Shenandoah Valley seemed to me best to fulfill the object of covering that valley from any movements from the direction of Richmond with any force less than the army under my command. The position was one also which gave most favorable facilities for the intended operations towards Gordonsville and Charlottesville.

At the date of my orders for this concentration of the army under my command, the Army of the Potomac under General McClellan occupied both banks of the Chickahominy, and it was hoped that his advance against Richmond, so long delayed, might be facilitated by vigorous use of the Army of Virginia.

During the preparation for the march of the corps of Banks and Sigel towards Sperryville and Little Washington, began the series of battles which preceded and attended the retreat of General McClellan from the Chickahominy towards Harrison's Landing.

When first General McClellan began to intimate by his dispatches that he designed making this retreat towards the James River, I suggested to the President the impolicy of such a movement, and the serious consequences that would be likely to result from it; I urged upon him that he send orders to General McClellan, if he were unable to maintain his position on the Chickahominy, and were pushed by superior forces of the enemy, to mass his whole force on the north side of that stream even at the risk of losing some of his material of war, and endeavor to retire in the direction of Hanover Court House, but in no event to retreat farther south than the White House on the Pamunkey River. I told the President that by the movement to the James River the whole army of the enemy would be interposed between General McClellan and myself, and that they would

then be able to strike in either direction as might seem most advantageous to them; that this movement would leave entirely unprotected, except so far as the small force under my command could protect it, the whole region in front of Washington, and that it would therefore be impossible to send him any of my troops without putting it in the power of the enemy to exchange Richmond for Washington; that to them the loss of Richmond would be comparatively a small loss, while to us the loss of Washington would be almost a fatal blow. I was so impressed with these opinions that I several times urged them upon the attention of the President and the Secretary of War.

The soundness of these views can be easily tested by subsequent facts. The enemy actually did choose between the danger of losing Richmond and the chance of capturing Washington. Stonewall Jackson's corps was detached from Lee's army confronting McClellan at Harrison's Landing early in July, and on the 19th of that month was concentrated at Gordonsville in my front; while Stuart's cavalry division, detached from Lee's army about the same time, was at or near Fredericksburg watching our movements from that direction. On the 13th of August Longstreet's whole corps was dispatched to join Jackson at Gordonsville, to which place he had fallen back from Cedar Mountain, and the head of Longstreet's corps had joined Jackson at that place on August 15th. These forces were commanded by Lee in person, who was at Gordonsville on that day. The first troops of the Army of the Potomac which left Harrison's Landing moved out from that place on August 14th, at which date there was nothing of Lee's army, except D. H. Hill's corps, left in front of McClellan or near to him. Hill's corps could have opposed but little effective resistance to the advance of the Army of the Potomac upon Richmond.

It seems clear, then, that the views expressed to the President and Secretary of War, as heretofore set forth, were sound, and that the enemy had left McClellan to work his will on Richmond, while they pushed forward against the small army under my command and to the capture of Washington. This movement of Lee was, in my opinion, in accordance with true military principle, and was the natural result of McClellan's retreat to Harrison's Landing, which completely separated the Army of the Potomac from the Army of Virginia and left the entire force of the enemy interposed between them.

The retreat of General McClellan to Harrison's Landing was, however, continued to the end. During these six days of anxiety and

apprehension Mr. Lincoln spent much of his time in the office of the Secretary of War, and most of that time reclining on a sofa or lounge. The Secretary of War was always with him, and from time to time his Cabinet officers came in. Mr. Lincoln himself appeared much depressed and wearied, though he would occasionally, while waiting for telegrams, break into some humorous remark, which seemed rather a protest against his despondent manner than any genuine expression of enjoyment. He spoke no unkind word of any one, and appeared to be anxious to bear himself all of the burden of the situation; and when the final result was reported he rose with a sorrowful face and left the War Department.

A day or two after General McClellan reached the James River I was called before the President and his Cabinet to consult upon means and movements to relieve him. I do not know that it would be proper even at this day for me to state what occurred or what was said during this consultation, except so far as I was myself directly concerned. General McClellan was calling for reinforcements, and stating that "much over rather than under

one hundred thousand men" were necessary before he could resume operations against Richmond. I had not under my command one half that force.

I stated to the President and Cabinet that I stood ready to undertake any movement, however hazardous, to relieve the Army of the Potomac. Some suggestions which seemed to me impracticable were made, and much was said which under the circumstances will not bear repetition.

I stated that only on one condition would I be willing to involve the army under my command in direct operations against the enemy to relieve the Army of the Potomac. That condition was, that such peremptory orders be given to General McClellan, and in addition such measures taken in advance as would render it certain that he would make a vigorous attack on the enemy with his whole force the moment he heard that I was engaged.

In face of the extraordinary difficulties which existed and the terrible responsibility about to be thrown on me, I considered it my duty to state plainly to the President that I could not risk the destruction of my army in such a movement as was suggested if it were left to the discretion of General McClellan or any one else to withhold the vigorous use of his whole force when my attack was made.

The whole plan of campaign for the army under my command was necessarily changed by the movement of the Army of the Potomac to Harrison's Landing. A day or two after General McClellan had reached his position on James River I addressed him a letter stating to him my position, the disposition of the troops under my command, and what was required of them, and requesting him in all good faith and earnestness to write me freely and fully his views, and to suggest to me any measures which he thought desirable to enable me to coöperate with him, and offering to render any assistance in my power to the operations of the army under his command. I stated to him that I was very anxious to assist him in his operations, and that I would undertake any labor or run any risk for that purpose. I therefore requested him to feel no hesitation in communicating freely with me, as he might rest assured that any suggestions he made would meet all respect and consideration from me, and that, so far as was within my power, I would carry out his wishes with all energy and all the means at my command. In reply to this communication I received a letter from General McClellan very general in its terms and proposing nothing toward the accomplishment of the purpose I suggested to him.

It became very apparent, therefore, considering the situation in which the Army of the

OUTLINE MAP OF THE CAMPAIGN.

Potomac and the Army of Virginia were placed in relation to each other and the absolute necessity of harmonious and prompt coöperation between them, that some military superior both of General McClellan and myself should be placed in general command of all the operations in Virginia, with power to enforce joint action between the two armies within that field of operations. General Halleck was accordingly called to Washington and assigned to the command-in-chief of the army, though Mr. Stanton was opposed to it and used some pretty strong language to me concerning General Halleck and my action in the matter. They, however, established friendly relations soon after General Halleck assumed command.

The reasons which induced me, in the first instance, to ask to be relieved from the command of the Army of Virginia as heretofore set forth, were greatly intensified by the retreat of General McClellan to James River and the bitter feelings and controversies which it occasioned, and I again requested the President to relieve me from the command and permit me to return to the West. The utter impossibility of sending General McClellan anything like the reinforcements he asked for, the extreme danger to Washington involved in sending him even a fraction of the small force under my command, and the glaring necessity of concentrating in some judicious manner and as rapidly as possible these two armies, resulted in a determination to withdraw the Army of the Potomac from the James River and unite it with the Army of Virginia. The question of the command of these armies when united was never discussed in my presence, if at all, and I left Washington with the natural impression that when this junction was accomplished General Halleck would himself assume the command in the field.

Under the changed condition of things brought about by General McClellan's retreat to James River, and the purpose to withdraw

HOUSE ON THE BATTLE-FIELD OF CEDAR MOUNTAIN WHERE GENERAL C. S. WINDER DIED.
(FROM A PHOTOGRAPH.)

General Winder, who was in command of Stonewall Jackson's old division, was struck by a shell while directing the movements of the batteries of his division.—EDITOR.

his army and unite it with that under my command, the campaign of the Army of Virginia was limited to the following objects :

1. To cover the approaches to Washington from any enemy advancing from the direction of Richmond, and to oppose and delay its advance to the last extremity so as to give all the time possible for the withdrawal of the Army of the Potomac from the James River.

2. If no heavy forces of the enemy moved north, to operate on their lines of communication with Gordonsville and Charlottesville, so as to force Lee to make heavy detachments from his force at Richmond and facilitate to that extent the withdrawal of the Army of the Potomac.

General Halleck was of the opinion that the junction of the two armies could be made on the line of the Rappahannock, and my orders to hold fast to my communications with Fredericksburg, through which place the Army of the Potomac was to make its junction with the Army of Virginia, were repeated positively.

The decision of the enemy to move north with the bulk of his army was promptly made and vigorously carried out, so that it became apparent, even before General McClellan began to embark his army, that the line of the Rappahannock was too far to the front. That fact, however, was not realized by General

Halleck until too late for any change which could be effectively executed.

Such was the organization of the Army of Virginia, and such its objects and the difficulties with which it was embarrassed from the very beginning. This rather long preface appears to me to be essential to any sufficient understanding of the second battle of Bull Run, and why and how it was fought. It is also necessary as a reply to a statement industriously circulated at the time and repeated again and again for obvious purposes, until no doubt it is generally believed, that I had set out to capture Richmond with a force sufficient for the purpose, and that the falling back from the Rapidan was unexpected by the Government and a great disappointment to it. The whole campaign was, and perhaps is yet, misunderstood because of the false impressions created by this statement.

Under the orders heretofore referred to, the concentration of the three corps of the Army of Virginia (except King's division of McDowell's corps) was completed, Sigel's corps being at Sperryville, Banks's at Little Washington, and Ricketts's division of McDowell's corps at Waterloo Bridge. I assumed the command in person July 29th, 1862.

As this paper is mainly concerned with the second battle of Bull Run, I shall not recount any of the military operations beyond the Rappahannock, nor give any account of the battle of Cedar Mountain and the skirmishes which followed.

It is only necessary to say that the course of these operations made it plain enough that the Rappahannock was too far to the front, and that the movements of Lee were too rapid and those of McClellan too slow to make it possible, with the small force I had, to hold that line, or to keep open communication with Fredericksburg without being turned on my right flank by Lee's whole army and cut off altogether from Washington.

On the 21st of August, being then at Rappahannock Station, my little army confronted by nearly the whole force under General Lee, which had compelled the retreat of McClellan to Harrison's Landing, I was positively as-

sured that two days more would see me largely enough reinforced by the Army of the Potomac to be not only secure but to assume the offensive against Lee, and I was instructed to hold on "and fight like the devil."

I accordingly held on till the 26th of August, when, finding myself to be outflanked on my right by the main body of Lee's army, while Jackson's corps having passed Salem and Rectortown the day before were in rapid march in the direction of Gainesville and Manassas Junction, and seeing that none

of the reinforcements promised me were likely to arrive, I determined to abandon the line of the Rappahannock and communications with Fredericksburg, and concentrate my whole force in the direction of Warrenton and Gainesville, to cover the Warrenton pike, and still to confront the enemy rapidly marching to my right.

Stonewall Jackson's movement was plainly seen and promptly reported, and I notified General Halleck of it. He informed me on the 23d of August that heavy reinforcements would begin to arrive at Warrenton Junction on the next day (24th), and as my orders still held me to the Rappahannock I naturally supposed that these troops would be hurried forward to me with all speed. Franklin's corps especially, I asked, should be sent rapidly to Gainesville. I also telegraphed Colonel Haupt

General F. J. Porter consisted of ten thousand men, and was by far the freshest if not the best in the army. He had made very short and deliberate marches from Fredericksburg, and his advance division, mainly troops of the regular army under Sykes, had arrived at Warrenton Junction by eleven o'clock on the morning of the 27th, Morell's division of the same corps arriving later in the same day.

to direct one of the strongest divisions coming forward, and to be at Warrenton Junction on the 24th, to be put in the works at Manassas Junction. A cavalry force had been sent forward to observe the Thoroughfare Gap early on the morning of the 26th, but nothing was heard from it.

On the night of August 26th Jackson's advance, having passed Thoroughfare Gap, struck the Orange and Alexandria railroad at Manassas Junction, and made it plain to me that all of the reinforcements and movements of the troops promised me had altogether failed. Had Franklin been even at Centerville, or had Cox's and Sturgis's divisions been as far west as Bull Run on that day, the movement of Jackson on Manassas Junction would not have been practicable.

As Jackson's movement on Manassas Junction marks the beginning of the second battle of Bull Run, it is essential to a clear understanding of subsequent operations to give the positions of the army under my command on the night of August 26th, as also the movements and operations of the enemy as far as we knew them.

From the 18th until the night of the 26th of August the troops had been marching and fighting almost continuously. As was to be expected under such circumstances, the effective force had been greatly diminished by death, by wounds, by sickness, and by fatigue.

Heintzelman's corps, which had come up from Alexandria, was at Warrenton Junction, and numbered, as he reported to me, less than eight thousand men, but it was without wagons, without artillery, without horses even for the field-officers, and with only forty rounds of ammunition to the man. The corps of

Porter at Warrenton Junction about eleven o'clock on the morning of the 27th. Sykes's division of his corps was encamped near; Morell's was expected in a few hours. I had seen General Porter at West Point while we were both cadets, but I think I never had an acquaintance with him there, nor do I think I ever met him afterward in the service except for about five minutes in Philadelphia in 1861, when I called at his office for a pass, then required to go to Washington *via* Annapolis. This, I think, was the first and only time I ever met him previous to the meeting at Warrenton Junction, but he had so high a reputation in the army and for

services since the outbreak of the war, that I was not only curious to see him, but was exceedingly glad that he had joined the army under my command with a corps which I knew to be one of the most effective in the service. This feeling was so strong that I expressed it warmly and on several occasions. He appeared to me a most gentlemanlike man, of a soldierly and striking appearance. I had but little conversation with him, as I was engaged, as he was, in writing telegrams. He seemed to me to exhibit a listlessness and

indifference not quite natural under the circumstances, which, however, it is not unusual for men to assume in the midst of dangers and difficulties, merely to impress one with their superior coolness.

The troops were disposed as follows: McDowell's corps and Sigel's corps were at Warrenton under general command of General McDowell, with Banks's corps at Fayetteville as a reserve. Reno's corps was directed upon the Warrenton turnpike to take post three miles east of Warrenton. Porter's corps was near Bealeton Station moving slowly towards Warrenton Junction; Heintzelman at Warrenton Junction, with very small means to move in any direction.

Up to this time I had been placed by the positive orders of General Halleck much in the position of a man tied by one leg and fighting with one much his physical superior and free to move in any direction. The following telegrams will explain exactly the situation as heretofore indicated:

"HEADQUARTERS ARMY OF VIRGINIA,

"August 25, 1862.

"MAJOR-GENERAL HALLECK:—Your dispatch just received. Of course I shall be ready to recross the Rappahannock at a moment's notice. You will see from the positions taken that each army corps is on the best roads across the river. You wished forty-eight hours to assemble the forces from the Peninsula behind the Rappahannock, and four days have passed without the enemy yet being permitted to cross. I don't think he is yet ready to do so. In ordinarily dry weather the Rappahannock can be crossed almost anywhere, and these crossing-places are best protected by concentrating at central positions to strike at any force which attempts to cross. I had clearly understood that you wished to unite our whole forces before a forward movement was begun, and that I must take care to keep united with Burnside on my left, so that no movement to separate us could be made. This withdrew me lower down the Rappahannock than I wished to come. I am not acquainted with your views, as you seem to suppose, and would be glad to know them so far as my own position and operations are concerned. I understood you clearly that, at all hazards, I was to prevent the enemy from passing the Rappahannock. This I have done, and shall do. I don't like to be on the defensive if I can help it, but must be so as long as I am tied to Burnside's forces, not yet wholly arrived at Fredericksburg. Please let me know, if it can be done, what is to be my own command, and if I am to act independently against the enemy. I certainly understood that, as soon as the whole of our forces were concentrated, you designed to take command in person, and that, when everything was ready, we were to move forward in concert. I judge from the tone of your dispatch that you are dissatisfied with something. Unless I know what it is, of course I can't correct it. The troops arriving here come in fragments. Am I to assign them to brigades and corps? I would suppose not, as several of the new regiments coming have been assigned to army corps directly from your office. In case I commence offensive operations I must know what forces I am to take and what you wish left, and what connection must be kept up with Burnside. It has been my purpose to conform my operations to your plans, yet I was not informed when McClellan evacu-

ated Harrison's Landing, so that I might know what to expect in that direction; and when I say these things in no complaining spirit I think that you know well that I am anxious to do everything to advance your plans of campaign. I understood that this army was to maintain the line of the Rappahannock until all the forces from the Peninsula had united behind that river. I have done so. I understood distinctly that I was not to hazard anything except for this purpose, as delay was what was wanted.

"The enemy this morning has pushed a considerable infantry force up opposite Waterloo Bridge, and is planting batteries, and long lines of his infantry are moving up from Jeffersonville towards Sulphur Springs. His whole force, as far as can be ascertained, is massed in front of me, from railroad crossing of Rappahannock around to Waterloo Bridge, their main body being opposite Sulphur Springs.

(Signed) "JOHN POPE, Major-General."

"UNITED STATES MILITARY TELEGRAPH.

(Received August 26, 1862, from War Department, 11:45 A. M.)

"MAJOR-GENERAL POPE:—Not the slightest dissatisfaction has been felt in regard to your operations on the Rappahannock. The main object has been accomplished in getting up troops from the Peninsula, although they have been greatly delayed by storms. Moreover, the telegraph has been interrupted, leaving us for a time ignorant of the progress of the evacuation. . . . If possible to attack the enemy in flank, do so, but the main object now is to ascertain his position. Make cavalry excursions for that purpose, especially toward Front Royal. If possible to get in his rear, pursue with vigor.

(Signed) "H. W. HALLECK, General-in-Chief."

The movements of the enemy towards my right forced me either to abandon the line of the Rappahannock and the communications with Fredericksburg, or to risk the loss of my army and the almost certain loss of Washington. Of course between these two alternatives I could not hesitate in a choice. I considered it my duty, at whatever sacrifice to my army and myself, to retard, as far as I could, the movement of the enemy towards Washington, until I was certain that the Army of the Potomac had reached Alexandria.

The movement of Jackson presented the only opportunity which had offered to gain any success over the superior forces of the enemy. I determined, therefore, on the morning of the 27th of August to abandon the line of the Rappahannock and throw my whole force in the direction of Gainesville and Manassas Junction, to crush any force of the enemy that had passed through Thoroughfare Gap, and to interpose between Lee's army and Bull Run. Having the interior line of operations, and the enemy at Manassas being inferior in force, it appeared to me, and still so appears, that with even ordinary promptness and energy we might feel sure of success.

In the mean time heavy forces of the enemy still confronted us at Waterloo Bridge, while his main body continued its march towards

MAJOR-GENERAL HENRY W. HALLECK. (FROM A PHOTOGRAPH.)

General Halleck, on July 23, 1862, assumed command as General-in-Chief of the armies of the United States, in compliance with the President's order of July 11.

our right, following the course of Hedgman's River (the Upper Rappahannock). I accordingly sent orders, early on the 27th of August, to General McDowell to move rapidly on Gainesville by the Warrenton pike with his own corps, reënforced by Reynolds's division and Sigel's corps. I directed Reno, followed by Kearny's division of Heintzelman's corps, to move on Greenwich, so as to reach there that night, to report thence at once to General McDowell, and to support him in operations against the enemy which were expected near Gainesville. With Hooker's division of Heintzelman's corps I moved along the railroad toward Manassas Junction, to reopen our communications and to be in position to coöperate with the forces along the Warrenton pike.

On the afternoon of that day a severe engagement took place between Hooker's

division and Ewell's division of Jackson's corps, near Bristoe Station, on the railroad. Ewell was driven back along the railroad, but at dark still confronted Hooker along the banks of Broad Run. The loss in this action was about three hundred killed and wounded on each side. Ewell left his dead, many of his wounded, and some of his baggage on the field.

I had not seen Hooker for many years, and I remembered him as a very handsome young man, with florid complexion and fair hair, and with a figure agile and graceful. As I saw him that afternoon on his white horse riding in rear of his line of battle, and close up to it, with the excitement of battle in his eyes, and that gallant and chivalric appearance which he always presented under fire, I was struck with admiration. As a corps

commander, with his whole force operating under his own eye, it is much to be doubted whether Hooker had a superior in the army.

The railroad had been torn up and the bridges burned in several places just west of Bristoe Station. I therefore directed General Banks, who had reached Warrenton Junction, to cover the railroad trains at that place until General Porter marched, and then to run back the trains toward Manassas as far as he could and rebuild the railroad bridges. Captain Merrill of the Engineers was also directed, with a considerable force, to repair the railroad track and bridges toward Bristoe. This work was done by that accomplished officer as far east as Kettle Run on the 27th, and the trains were run back to that point next morning.

At dark on the 27th Hooker informed me that his ammunition was nearly exhausted, only five rounds to the man being on hand. Before this time it had become apparent

In consequence of Hooker's report, and the weakness of the small division which he commanded, and to strengthen my right wing moving in the direction of Manassas, I sent orders to Porter at dark, which reached him at 9 o'clock P. M., to move forward from Warrenton Junction at one o'clock that night, and to report to me at Bristoe Station by daylight next morning (August 28th).

There were but two courses left to Jackson by this sudden movement of the army. He could not retrace his steps through Gainesville, as that place was occupied by McDowell with a force equal if not superior to his own. To retreat through Centreville would carry him still farther away from the main body of Lee's army. It was possible, however, to mass his whole force at Manassas Junction and assail our right (Hooker's division), which had fought a severe battle that afternoon, and was almost out of ammunition. Jackson with A. P. Hill's division retired through Centreville.* Thinking it altogether within the probabilities that he might adopt the other alternative, I sent the orders above mentioned to General Porter. He neither obeyed them nor attempted to obey them, but afterward gave as a reason for not doing so that his men were tired, the night was too dark to march, and that there was a wagon train on the road toward Bristoe. The distance was nine miles along the railroad track, with a wagon road on each side of it most of the way; but his corps did not reach Bristoe Station until 10:30 o'clock next morning, six hours after daylight; and the moment he found that the enemy had left our front he asked to halt and rest his corps. Of his first reason for not complying with my orders, it is only necessary to say that Sykes's division had reached Warrenton Junction at 11 o'clock on the morning of the 27th, and had been in camp all day. Morell's division arrived later in the day at Warrenton Junction, and would have been in camp for at least eight hours before the time it was ordered to march. The marches of these two divisions from Fredericksburg had been extremely deliberate, and involved but little more exercise than is needed for good health. The diaries of these marches make Porter's claim of fatigue ridiculous. To compare the condition of this corps and its marches with those of any of the troops of the Army of Virginia is a sufficient answer to such a pretext. The impossibility of marching on account of the darkness of that night finds its best answer

MAJOR-GENERAL FRANZ SIGEL. (FROM A PHOTOGRAPH.)

that Jackson, with his whole force, was south of the Warrenton pike and in the immediate neighborhood of Manassas Junction.

McDowell reached his position at Gainesville during the night of the 27th, as did also Kearny and Reno at Greenwich, and it was clear on that night that we had completely interposed between Jackson and the main body of the enemy under Lee, which was still west of the Bull Run range and in the vicinity of White Plains.

* A. P. Hill's division was sent by Jackson on a round-about march to Centreville, apparently as a ruse. Two brigades of Ewell followed A. P. Hill. Ewell's other two brigades followed Hill to the north side of Bull

Run, and then marched up stream to the Stone Bridge, crossing south again by the pike; Taliaferro's division took the shortest route to Groveton, following the Sudley Springs road to the Warrenton pike.—EDITOR.

in the fact that nearly every other division of the army, and the whole of Jackson's corps, marched during the greater part of the night in the immediate vicinity of Porter's corps, and from nearly every point of the compass. The plea of darkness and of the obstruction of a wagon train along the road will strike our armies with some surprise in the light of their subsequent experience of night marches. The railroad track itself was clear and entirely practicable for the march of infantry.

According to the testimony of Colonel Myers, quartermaster in charge of the train, the train was drawn off the roads and parked after dark that night; and even if this had not been the case, it is not necessary to tell any officer who served in the war that the infantry advance could easily have pushed the wagons off the road to make way for the artillery. Colonel Myers also testified that he could have gone on with his train that night, and that he drew off the road and parked his train for rest and because of the action of Hooker's division in his front, and not because he was prevented from continuing his march by darkness or other obstacles.

At nine o'clock on the night of the 27th, satisfied of Jackson's position, I sent orders to General McDowell at Gainesville to push forward at the earliest dawn of day upon Manassas Junction, resting his right on the Manassas Gap Railroad and extending his left to the east. I directed General Reno at the same time to march from Greenwich, also direct on Manassas Junction, and Kearny to move from the same place upon Bristoe Station. This move of Kearny was to strengthen my right at Bristoe and unite the two divisions of Heintzelman's corps.

Jackson began to evacuate Manassas Junction during the night (the 27th) and marched toward Centreville and other points of the Warrenton pike west of that place, and by eleven o'clock next morning was at and beyond Centreville and north of the Warrenton pike. I arrived at Manassas Junction shortly after the last of Jackson's force had moved off, and immediately pushed forward Hooker, Kearny, and Reno upon Centreville, and sent orders to Porter to come forward to Manassas Junction. I also wrote McDowell the situation and directed him to call back to Gainesville any part of his force which had moved in the direction of Manassas Junction, and march upon Centreville along the Warrenton pike with the whole force under his command to intercept the retreat of Jackson toward Thoroughfare Gap. With King's division in advance, McDowell, marching toward Centreville, encountered late in the afternoon the advance of Jackson's corps retreating toward Thorough-

fare Gap. Late in the afternoon, also, Kearny drove the rear-guard of Jackson out of Centreville and occupied that place with his advance beyond it toward Gainesville. A very severe engagement occurred between King's division and Jackson's forces near the village of Groveton on the Warrenton pike, which was termi-

MAJOR-GENERAL ROBERT C. SCHENCK. (FROM A PHOTOGRAPH.)

nated by the darkness, both parties maintaining their ground. The conduct of this division in this severe engagement was admirable, and reflects the utmost credit both upon its commanders and the men under their command. That this division was not reinforced by Reynolds and Sigel seems unaccountable. The reason given, though it is not satisfactory, was the fact that General McDowell had left the command just before it encountered the enemy, and had gone toward Manassas Junction, where he supposed me to be, in order to give me some information about the immediate country in which we were operating, and with which, of course, he was much more familiar from former experience than I could be. I had left Manassas Junction, however, for Centreville. Hearing the sound of the guns indicating King's engagement with the enemy, McDowell set off to rejoin his command, but lost his way, and I first heard of him next morning at Manassas Junction. As his troops did not know of his absence, there was no one to give orders to Sigel and Reynolds.

The engagement of King's division was reported to me about ten o'clock at night near Centreville. I felt sure then, and so stated, that there was no escape for Jackson. On the west of him were McDowell's corps (I did

CHARGE OF UNION CAVALRY UPON THE CONFEDERATE ADVANCE NEAR BRANDY STATION, AUGUST 20, 1862.
(BY EDWIN FORBES, FROM HIS SKETCH MADE AT THE TIME.)

not then know that he had detached Ricketts), Sigel's corps, and Reynolds's division, all under command of McDowell. On the east of him, and with the advance of Kearny nearly in contact with him on the Warrenton pike, were the corps of Reno and Heintzelman. Porter was supposed to be at Manassas Junction, where he ought to have been on that afternoon.

I sent orders to McDowell (supposing him to be with his command), and also direct to General King, several times during that night and once by his own staff-officer, to hold his ground at all hazards, to prevent the retreat of Jackson toward Lee, and that at daylight our whole force from Centreville and Manassas would assail him from the east, and he would be crushed between us. I sent orders also to General Kearny at Centreville to move forward cautiously that night along the Warrenton pike; to drive in the pickets of the enemy, and to keep as closely as possible in contact with him during the night, resting his left on the Warrenton pike and throwing his right to the north, if practicable, as far as the Little River pike, and at daylight next morning to assault vigorously with his right advanced, and that Hooker and Reno would certainly be with him shortly after daylight. I sent orders to General Porter, who I supposed was at Manassas Junction, to move upon Centreville at dawn, stating to him the

position of our forces, and that a severe battle would be fought that morning (the 29th).

With Jackson at and near Groveton, with McDowell on the west, and the rest of the army on the east of him, while Lee, with the mass of his army, was still west of Thoroughfare Gap, the situation for us was certainly as favorable as the most sanguine person could desire, and the prospect of crushing Jackson, sandwiched between such forces, was certainly excellent. There is no doubt, had General McDowell been with his command when King's division of his corps became engaged with the enemy, he would have brought forward to its support both Sigel and Reynolds, and the result would have been to hold the ground west of Jackson at least until morning brought against him also the forces moving from the direction of Centreville.

To my great disappointment and surprise, however, I learned toward daylight the next morning (the 29th) that King's division had fallen back toward Manassas Junction, and that neither Sigel nor Reynolds had been engaged or had gone to the support of King. The route toward Thoroughfare Gap had thus been left open by the wholly unexpected retreat of King's division, due to the fact that he was not supported by Sigel and Reynolds, and an immediate change was necessary in the disposition of the troops under my command. Sigel and Reynolds were near Grove-

ton, almost in contact with Jackson; Ricketts had fallen back toward Bristoe from Thoroughfare Gap, after offering (as might have been expected) ineffectual resistance to the passage of the Bull Run range by very superior forces; King had fallen back to Manassas Junction; Porter was at Manassas Junction or near there; Reno and Hooker near Centreville; Kearny at Centreville and beyond toward Groveton; Jackson near Groveton with his whole corps; Lee with the main army of the enemy, except three brigades of Longstreet which had passed Hopewell Gap, north of Thoroughfare Gap.

The field of battle was practically limited to the space between the old railroad grade from Sudley to Gainesville if prolonged across the Warrenton pike and the Sudley Springs road east of it. The railroad grade indicates almost exactly the line occupied by Jackson's force, our own line confronting it from left to right.

The ridge which bounded the valley of Dawkins's Branch on the west, and on which were the Hampton Cole and Monroe houses, offered from the Monroe house a full view of the field of battle from right to left, and the Monroe house being on the crest of the ridge overlooked and completely commanded the

approach to Jackson's right by the Warrenton turnpike. To the result of the battle this ridge was of the last importance, and if seized and held by noon, would absolutely have prevented any reënforcement of Jackson's right from the direction of Gainesville. The northern slope of this ridge was held by our troops near the Douglass house, near which, also, the right of Jackson's line rested. The advance of Porter's corps at Dawkins's Branch was less than a mile and a half from the Monroe house, and the road in his front was one of several which converged on that point.

The whole field was free from obstacles to movement of troops and nearly so to manœuvre, with only a few eminences, and these of a nature to have been seized and easily held by our troops even against very superior numbers. The ground was gently undulating and the water-courses insignificant, while the intersecting system of roads and lanes afforded easy communication with all parts of the field. It would be difficult to find anywhere in Virginia a more perfect field of battle than that on which the second battle of Bull Run was fought.

About daylight, therefore, on the 29th of August, almost immediately after I received information of the withdrawal of King's divis-

THE SUDLEY SPRINGS ROAD, LOOKING NORTH FROM THE SLOPE OF THE HENRY HOUSE HILL.

In the middle-ground on the Warrenton turnpike stands the Stone House, the central landmark in both battles of Bull Run. The bank in the right foreground was a cover during the first battle for some of the supports of the Union batteries on the Henry House hill, the crest of which is two hundred and fifty yards distant to the right. In the first battle the fighting began on the Matthews hill, seen in the background behind the Stone

House, and was most desperate on the Henry hill. In the second battle the fighting was on the other side of the Sudley Springs road, and extended from the north round to the south-west, on Bald Hill, and ended on the Henry hill and the turnpike. Pope's headquarters on August 29 and 30, 1862, were on the rising ground behind the Stone House.

CONFLICT OF THURSDAY, AUGUST 28, BETWEEN KING'S DIVISION AND JACKSON'S RIGHT WING.
(BY EDWIN FORBES, FROM HIS SKETCH MADE AT THE TIME.)

The view is from the north side of the Warrenton turnpike, a little east of Gainesville, and looking towards Manassas Junction, where smoke is seen over the ruins of the stores fired by Jackson during the previous night. King's infantry forms two lines perpendicular to and across the turnpike. The Confederates are

in the woods. During the battle of the following Friday and Saturday, August 29 and 30, the opposing lines were reversed; Jackson was to the left looking toward Manassas, and Longstreet's lines, facing like King's in the above picture, were a little farther down the pike and extended far to the right.—EDITOR.

ion toward Manassas Junction, I sent orders to General Sigel, in the vicinity of Groveton, to attack the enemy vigorously at daylight and bring him to a stand if possible. He was to be supported by Reynolds's division. I instructed Heintzelman to push forward from Centreville toward Gainesville on the Warrenton pike at the earliest dawn with the divisions of Kearny and Hooker, and gave orders also to Reno with his corps to follow closely in their rear. They were directed to use all speed, and as soon as they came up with the enemy to establish communication with Sigel, and to attack vigorously and promptly. I also sent orders to General Porter at Manassas Junction to move forward rapidly with his own corps and King's division of McDowell's corps, which was there also, upon Gainesville by the direct route from Manassas Junction to that place. I urged him to make all possible speed, with the purpose that he should come up with the enemy or connect himself with the left of our line near where the Warrenton pike is crossed by the road from Manassas Junction to Gainesville.

Shortly after sending this order I received a note from General McDowell, whom I had not been able to find during the night of the 28th, dated Manassas Junction, requesting

that King's division be not taken from his command. I immediately sent a joint order, addressed to Generals McDowell and Porter, repeating the instructions to move forward with their commands toward Gainesville, and informing them of the position and movements of Sigel and Heintzelman.

Sigel attacked the enemy at daylight on the morning of the 29th about a mile east of Groveton, where he was joined by the divisions of Hooker and Kearny. Jackson fell back, but was so closely pressed by these forces that he was obliged to make a stand. He accordingly took up his position along and behind the old railroad embankment extending along his entire front, with his left near Sudley Springs and his right just south of the Warrenton pike. His batteries, some of them of heavy caliber, were posted behind the ridges in the open ground, while the mass of his troops were sheltered by woods and the railroad embankment.

I arrived on the field from Centreville about noon, and found the opposing forces confronting each other both considerably cut up by the severe action in which they had been engaged since daylight. Heintzelman's corps (the divisions of Hooker and Kearny) occupied the right of our line toward Sudley Springs. Sigel was on his left, with his line extending

a short distance south of the Warrenton pike, the division of Schenck occupying the high ground to the left (south) of the pike. The extreme left was held by Reynolds. Reno's corps had reached the field and the most of it had been pushed forward into action, leaving four regiments in reserve behind the center of the line of battle. Immediately after I reached the ground, General Sigel reported to me that his line was weak, that the divisions of Schurz and Steinwehr were much cut up and ought to be drawn back from the front. I informed him that this was impossible, as there were no troops to replace them, and that he must hold his ground; that I would not immediately push his troops again into action, as the corps of McDowell and Porter were moving forward on the road from Manassas Junction to Gainesville, and must very soon be in position to fall upon the enemy's right flank and possibly on his rear. I rode along the front of our line and gave the same information to Heintzelman and Reno. I shall not soon forget the bright and confident face and the alert and hearty manner of that most accomplished and loyal soldier, General J. L. Reno. From first to last in this campaign he was always cheerful and ready; anxious to anticipate if possible, and prompt to execute with all his might, the orders he received. He was short in stature and upright in person, and with a face and manner so bright and engaging at all times, but most especially noticeable in the fury of battle, that it was both a pleasure and a comfort to see him. In his death, two weeks afterward, during the battle of South Mountain, when he led his troops with his usual gallantry and daring, the Government lost one of its best and most promising officers. Had he lived to see the end of the war, he would undoubtedly have attained one of the highest, if not the very highest position in the army. His superior abilities were unquestioned, and if he lacked one single element that goes to make a perfect soldier, certainly it was not discovered before his death.

The troops were permitted to rest for a time, and to resupply themselves with ammunition. From 1:30 to 4 o'clock P. M. very severe conflicts occurred repeatedly all along the line, and there was a continuous roar of artillery and small arms, with scarcely an intermission. About two o'clock in the afternoon three discharges of artillery were heard on the extreme left of our line or right of the enemy's, and I for the moment, and naturally, believed that Porter and McDowell had reached their positions and were engaged with the enemy. I heard only three shots, and as nothing followed I was at a loss to know what had become of these corps, or what was delaying them, as

before this hour they should have been, even with ordinary marching, well up on our left. Shortly afterwards I received information that McDowell's corps was advancing to join the left of our line by the Sudley Springs road, and would probably be up within two hours. At 4:30 o'clock I sent a peremptory order to General Porter, who was at or near Dawkins's

BRIGADIER-GENERAL CUVIER GROVER. (FROM A PHOTOGRAPH.)

Both on Friday and Saturday afternoons there was desperate fighting about the railroad cut and embankment opposite and to the right of the site of the battle monument (see map on the next page). Grover's brigade of Hooker's division here charged Jackson's center on Friday afternoon, before Kearny's successful and bloody charge on Jackson's left. Grover led five regiments, altogether about 1500 men, and in twenty minutes lost 486, or nearly one-third of his command. In his report General Grover says: "I rode over the field in front as far as the position of the enemy would admit. After rising the hill under which my command lay an open field was entered, and from one edge of it gradually fell off in a slope to a valley, through which ran a railroad embankment. Beyond this embankment the forest continued, and the corresponding heights beyond were held by the enemy in force, supported by artillery. At 3 P. M. I received an order to advance in line of battle over this ground, pass the embankment, enter the edge of the woods beyond, and hold it. Dispositions for carrying out such orders were immediately made. Pieces were loaded, bayonets fixed, and instructions given for the line to move slowly upon the enemy until it felt his fire, then close upon him rapidly, fire one well-directed volley, and rely upon the bayonet to secure the position on the other side. We rapidly and firmly pressed upon the embankment, and here occurred a short, sharp, and obstinate hand-to-hand conflict with bayonets and clubbed muskets. Many of the enemy were bayoneted in their tracks, others struck down with the butts of pieces, and onward pressed our line. In a few yards more it met a terrible fire from a second line, which in its turn broke. The enemy's third line now bore down upon our thinned ranks in close order, and swept back the right center and a portion of our left. With the gallant Sixteenth Massachusetts on our left I tried to turn his flank, but the breaking of our right center and the weight of the enemy's lines caused the necessity of falling back, first to the embankment, and then to our first position, behind which we rallied to our colors."—EDITOR.

Branch, about four or five miles distant from my headquarters, to push forward at once into action on the enemy's right, and if possible on his rear, stating to him generally the con-

SECOND BATTLE OF BULL RUN

POSITION OF TROOPS

AT SUNSET,
AUG. 29, 1862.

POSITIONS OF TROOPS AT SUNSET, FRIDAY, AUGUST 29.

At noon of that day Porter's corps was in much the same position as at sunset; and, according to General Pope, at noon Porter, with very little resistance to overcome, might have occupied the hill of the Monroe and Hampton Cole houses. The great importance to the Union army of that position is described by General Pope on page 453. Longstreet at that hour was hurrying to the field through Gainesville, and the right of the Union army was

arrayed in continuous line in front of Jackson from a point on the turnpike three-quarters of a mile west of Groveton to the point where the Sudley Springs road crosses the unfinished railroad which was Jackson's stronghold. The map above illustrates the situation at the time of the greatest success on the right, when Jackson's left had been turned upon itself by Kearny's, Reno's, and Hooker's divisions.—EDITOR.

dition of things on the field in front of me. At 5:30 o'clock, when General Porter should have been going into action in compliance with this order, I directed Heintzelman and Reno to attack the enemy's left. The attack was made promptly and with vigor and persistence, and the left of the enemy was doubled back toward his center. After a severe and bloody action of an hour, Kearny forced the position on the left of the enemy and occupied the field of battle there.

By this time General McDowell had arrived on the field, and I pushed his corps, supported by Reynolds, forward at once into action along the Warrenton pike toward the enemy's right, then said to be falling back. This attack along the pike was made by King's division near sunset; but as Porter made no movement whatever toward the field, Longstreet, who was pushing to the front, was able to extend his lines beyond King's left with impunity, and King's attack did not accomplish what was expected, in view of the anticipated attack which Porter was ordered to make, and should have been making at the same time.

From five o'clock in the day until some time after dark the fighting all along our lines was severe and bloody, and our losses were very heavy. To show clearly the character of the battle on the 29th, I embody extracts from the official reports of General Lee, of General T. J. Jackson, and of Longstreet and Hill, who commanded the enemy's forces on that day. I choose the reports of the officers commanding against us for several reasons, but especially to show Longstreet's movements and operations on the afternoon of the 29th of August, when, it is alleged, he was held in check by Porter. General Lee says:

... "Generals Jones and Wilcox bivouacked that night east of the mountain; and on the morning of the twenty-ninth the whole command resumed the march, the sound of cannon at Manassas announcing that Jackson was already engaged. Longstreet entered the turnpike near Gainesville, and moving down toward Groveton, the head of his column came upon the field in rear of the enemy's left, which had already opened with artillery upon Jackson's right, as previously described. He immediately placed some of his batteries in position, but before he could complete his dispositions to attack, the enemy withdrew; not, however, without loss from our artillery. Longstreet took position on the right of Jackson, Hood's two brigades, supported by Evans, being deployed across the turnpike, and at right angles to it. These troops were supported on the left by three brigades under General Wilcox, and by a like force on the right under General Kemper. D. R. Jones's division formed the extreme right of the line, resting on the Manassas Gap railroad. The cavalry guarded our right and left flanks; that on the right being under General Stuart in person. After the arrival of Longstreet the enemy changed his position and began to concentrate opposite Jackson's left, opening a brisk artillery fire, which was responded

to with effect by some of General A. P. Hill's batteries. Colonel Walton placed a part of his artillery upon a commanding position between the lines of Generals Jackson and Longstreet, by order of the latter, and engaged the enemy vigorously for several hours. Soon afterward General Stuart reported the approach of a large force from the direction of Bristoe Station, threatening Longstreet's right. The brigades under General Wilcox were sent to reinforce General Jones, but no serious attack was made, and after firing a few shots the enemy withdrew. While this demonstration was being made on our right, a large force advanced to assail the left of Jackson's position, occupied by the division of General A. P. Hill. The attack was received by his troops with their accustomed steadiness, and the battle raged with great fury. The enemy was repeatedly repulsed, but again pressed on to the attack with fresh troops. Once he succeeded in penetrating an interval between General Gregg's brigade, on the extreme left, and that of General Thomas, but was quickly driven back with great slaughter by the Fourteenth South Carolina regiment, then in reserve, and the Forty-ninth Georgia, of Thomas's brigade. The contest was close and obstinate; the combatants sometimes delivering their fire at ten paces. General Gregg, who was most exposed, was reinforced by Hays's brigade under Colonel Forno, and successfully and gallantly resisted the attacks of the enemy, until, the ammunition of his brigade being exhausted, and all his field-officers but two killed or wounded, it was relieved, after several hours of severe fighting, by Early's brigade and the Eighth Louisiana regiment. General Early drove the enemy back, with heavy loss, and pursued about two hundred yards beyond the line of battle, when he was recalled to the position on the railroad where Thomas, Pender, and Archer had firmly held their ground against every attack. While the battle was raging on Jackson's left, General Longstreet ordered Hood and Evans to advance, but before the order could be obeyed Hood was himself attacked, and his command at once became warmly engaged. General Wilcox was recalled from the right and ordered to advance on Hood's left, and one of Kemper's brigades, under Colonel Hunton, moved forward on his right. The enemy was repulsed by Hood after a severe contest, and fell back, closely followed by our troops. The battle continued until 9 P. M., the enemy retreating until he reached a strong position, which he held with a large force. The darkness of the night put a stop to the engagement, and our troops remained in their advanced position until early next morning, when they were withdrawn to their first line. One piece of artillery, several stands of colors, and a number of prisoners were captured. Our loss was severe in this engagement; Brigadier-Generals Field and Trimble, and Colonel Forno, commanding Hays's brigade, were severely wounded, and several other valuable officers killed or disabled whose names are mentioned in the accompanying reports."

General Jackson in his report dated April 27, 1863, says:

... "My troops on this day were distributed along and in the vicinity of the cut of an unfinished railroad (intended as a part of the track to connect the Manassas road directly with Alexandria), stretching from the Warrenton turnpike in the direction of Sudley's Mill. It was mainly along the excavation of this unfinished road that my line of battle was formed on the 29th: Jackson's division, under Brigadier-General Starke, on the right; Ewell's division, under Brigadier-General Lawton, in the center; and Hill's division on the left. In the morning, about 10 o'clock, the Federal artillery opened with spirit and animation

upon our right, which was soon replied to by the batteries of Poague, Carpenter, Dement, Brockenbrough, and Latimer, under Major (L. M.) Shumaker. This lasted for some time, when the enemy moved around more to our left, to another point of attack. His next effort was directed against our left. This was vigorously repulsed by the batteries of Braxton, Crenshaw, and Pegram. About 2 o'clock P. M. the Federal infantry, in large force, advanced to the attack of our left, occupied by the division of General Hill. It pressed forward in defiance of our fatal and destructive fire with great determination, a portion of it crossing a deep cut in the railroad track, and penetrating in heavy force an interval of nearly one hundred and seventy-five yards, which separated the right of Gregg's from the left of Thomas's brigade. For a short time Gregg's brigade, on the extreme left, was isolated from the main body of the command. But the Fourteenth South Carolina regiment, then in reserve, with the Forty-ninth Georgia, left of Colonel Thomas, attacked the exultant enemy with vigor and drove them back across the railroad track with great slaughter." . . .

General Longstreet says in his report, dated October 10, 1862:

. . . "Early on the 20th [August] the columns [that had passed Thoroughfare and Hopewell Gaps] were united, and the advance to join General Jackson was resumed. The noise of battle was heard before we reached Gainesville. The march was quickened to the extent of our capacity. The excitement of battle seemed to give new life and strength to our jaded men, and the head of my column soon reached a position in rear of the enemy's left flank, and within easy cannon-shot.

"On approaching the field some of Brigadier-General Hood's batteries were ordered into position, and his division was deployed on the right and left of the turnpike, at right angles with it, and supported by Brigadier-General Evans's brigade. Before these batteries could open, the enemy discovered our movements and withdrew his left. Another battery (Captain Stribling's) was placed upon a commanding position to my right, which played upon the rear of the enemy's left and drove him entirely from that part of the field. He changed his front rapidly, so as to meet the advance of Hood and Evans.

"Three brigades, under General Wilcox, were thrown forward to the support of the left; and three others, under General Kemper, to the support of the right of these commands. General D. R. Jones's division was placed upon the Manassas Gap railroad to the right, and in echelon with regard to the three last brigades. Colonel Walton placed his batteries in a commanding position between my line and that of General Jackson, and engaged the enemy for several hours in a severe and successful artillery duel. At a late hour in the day Major-General Stuart reported the approach of the enemy in heavy columns against my extreme right. I withdrew General Wilcox, with his three brigades, from the left, and placed his command in position to support Jones in case of an attack against my right. After some few shots the enemy withdrew his forces, moving them around toward his front, and about four o'clock in the afternoon began to press forward against General Jackson's position. Wilcox's brigades were moved back to their former position, and Hood's two brigades, supported by Evans, were quickly pressed forward to the attack. At the same time Wilcox's three brigades made a like advance, as also Hunton's brigade, of Kemper's command.

"These movements were executed with commendable zeal and ability. Hood, supported by Evans, made a gallant attack, driving the enemy back till nine o'clock

at night. One piece of artillery, several regimental standards, and a number of prisoners were taken. The enemy's entire force was found to be massed directly in my front, and in so strong a position that it was not deemed advisable to move on against his immediate front; so the troops were quietly withdrawn at one o'clock the following morning. The wheels of the captured piece were cut down, and it was left on the ground. The enemy seized that opportunity to claim a victory, and the Federal commander was so imprudent as to dispatch his Government, by telegraph, tidings to that effect. After withdrawing from the attack, my troops were placed in the line first occupied, and in the original order."

General A. P. Hill says in his report, dated February 25, 1863:

. . . "Friday morning, in accordance with orders from General Jackson, I occupied the line of the unfinished railroad, my extreme left resting near Sudley Ford, my right near the point where the road strikes the open field, Gregg, Field, and Thomas in the front line; Gregg on the left and Field on the right; with Branch, Pender, and Archer as supports. . . .

"The evident intention of the enemy this day was to turn our left and overwhelm Jackson's corps before Longstreet came up, and to accomplish this the most persistent and furious onsets were made, by column after column of infantry, accompanied by numerous batteries of artillery. Soon my reserves were all in, and up to six o'clock my division, assisted by the Louisiana brigade of General Hays, commanded by Colonel Forno, with a heroic courage and obstinacy almost beyond parallel, had met and repulsed six distinct and separate assaults, a portion of the time the majority of the men being without a cartridge. . . .

"The enemy prepared for a last and determined attempt. Their serried masses, overwhelming superiority of numbers, and bold bearing made the chances of victory to tremble in the balance; my own division exhausted by seven hours' unremitted fighting, hardly one round per man remaining, and weakened in all things save its unconquerable spirit. Casting about for help, fortunately it was here reported to me that the brigades of Generals Lawton and Early were near by, and, sending to them, they promptly moved to my front at the most opportune moment, and this last charge met the same disastrous fate that had befallen those preceding. Having received an order from General Jackson to endeavor to avoid a general engagement, my commanders of brigades contented themselves with repulsing the enemy and following them up but a few hundred yards."

General J. E. B. Stuart says in his report, dated February 28, 1863:

. . . "I met with the head of General Longstreet's column between Haymarket and Gainesville, and there communicated to the commanding general General Jackson's position and the enemy's. I then passed the cavalry through the column so as to place it on Longstreet's right flank, and advanced directly towards Manassas, while the column kept directly down the pike to join General Jackson's right. I selected a fine position for a battery on the right, and one having been sent to me, I fired a few shots at the enemy's supposed position, which induced him to shift his position. General Robertson, who, with his command, was sent to reconnoiter farther down the road toward Manassas, reported the enemy in his front. Upon repairing to that front, I found that Rosser's regiment was engaged with the enemy to the left of the road, and Robertson's vedettes had found the enemy approaching from the di-

rection of Bristoe Station towards Sudley. The prolongation of his line of march would have passed through my position, which was a very fine one for artillery as well as observation, and struck Longstreet in flank. I waited his approach long enough to ascertain that there was at least an army corps, at the same time keeping detachments of cavalry dragging brush down the road from the direction of Gainesville, so as to deceive the enemy (a ruse which Porter's report shows was successful), and notified the commanding general, then opposite me on the turnpike, that Longstreet's flank and rear were seriously threatened, and of the importance to us of the ridge I then held. Immediately upon the receipt of that intelligence, Jenkins's, Kemper's, and D. R. Jones's brigades, and several pieces of artillery were ordered to me by General Longstreet, and being placed in position fronting Bristoe, awaited the enemy's advance. After exchanging a few shots with rifle-pieces this corps withdrew toward Manassas, leaving artillery and supports to hold the position till night. Brigadier-General Fitz Lee returned to the vicinity of Sudley, after a very successful expedition, of which his official report has not been received, and was instructed to coöperate with Jackson's left. Late in the afternoon the artillery on this commanding ridge was, to an important degree, auxiliary to the attack upon the enemy, and Jenkins's brigade repulsed the enemy in handsome style at one volley, as they advanced across a corn-field. Thus the day ended, our lines having considerably advanced."

What would have been the effect of the application on the enemy's right at, or at any time after, five o'clock that afternoon of ten or twelve thousand effective men who had not been in battle at all, I do not myself consider doubtful.

In this battle the Fifth Corps, under General F. J. Porter, took no part whatever, but remained all day in column, without even deploying into line of battle or making any effort in force to find out what was in their front. That General Porter knew of the progress of the battle on his right, and that he believed the Union army was being defeated, is shown by his own dispatches to McDowell, several times repeated during the day. That subjoined will be sufficient:

"GENERALS MCDOWELL AND KING:—I found it impossible to communicate by crossing the woods to Groveton. The enemy are in great force on this road, and as they appear to have driven our forces back, the fire of the enemy having advanced and ours retired, I have determined to withdraw to Manassas. I have attempted to communicate with McDowell and Sigel, but my messengers have run into the enemy. They have gathered artillery and cavalry and infantry, and the advancing masses of dust show the enemy coming in force. I am now going to the head of the column to see what is passing and how affairs are going, and I will communicate with you. Had you not better send your train back?"

"F. J. PORTER, Major-General."

Not the artillery only, but the volleys of musketry in this battle were also plainly heard on their right and front by the advance of Porter's troops much of the day. In consequence of his belief that the army on his right was being defeated, as stated in more than

one of these dispatches, he informed General McDowell that he intended to retire to Manassas, and advised McDowell to send back his trains in the same direction.

For this action, or non-action, he has been on the one hand likened to Benedict Arnold, and on the other favorably compared with George Washington. I presume he would not accept the first position, and probably would hardly lay claim to the second. Certainly I have not the inclination, even had I the power, to assign him to either or to any position between the two; and if he were alone concerned in the question, I should make no comment at all on the subject at this day. Many others than himself and the result of a battle, however, are involved in it, and they do not permit silence when the second battle of Bull Run is discussed. Without going into the merits of the case, which has been obscured and confused by so many and such varied controversies, I shall confine myself to a bare statement of the facts as they are known to me personally, or communicated officially by officers of rank and standing, and by the official reports of both armies engaged in the battle. General Porter was tried by court-martial a few months after the battle and was cashiered. The reasons given by him at the time for his failure to go into action, or take any part in the battle, were: first, that he considered himself under General McDowell's orders, who told him that they were too far to the front for a battle; and, second, that the enemy was in such heavy force in his front that he would have been defeated had he attacked. General McDowell stated before the court-martial that, so far from saying that they were too far to the front for battle, he directed General Porter before leaving him to put his corps into the action where he was, and that he (McDowell) would move farther to the right and go into the battle there. Upon Porter remarking that he could not go in there without getting into a fight, McDowell replied, "I thought that was what we came here for."

General Stuart (J. E. B.), who commanded the cavalry in Lee's army, tells in his official report above quoted precisely what was in General Porter's front, and what means he took to produce upon General Porter the impression that there were heavy forces in front of him and advancing toward him. General Porter certainly made no reconnoissance in force to ascertain whether or not there was a heavy force in his front; and Stuart's report makes it quite certain that at the time referred to by him, Porter could easily have moved forward from Dawkins's Branch and seized the ridge on which are the Hampton, Cole,

and Monroe houses, from which he would have had a complete view of the field from right to left. Not only this, but his occupation of that ridge would have connected him closely with our left, and absolutely prevented Longstreet from forming on Jackson's right until he had dislodged Porter, which would have occupied him too long to have permitted the effective use of his troops for any other

Longstreet did not annihilate Porter's corps during the day if it were so easily in his power to do so. It is also proper to suggest that it would have required a long time and all of his force to do this annihilating business on such a corps as Porter's; and in that case, what would have become of Jackson's right deprived of Longstreet's active support, which barely enabled Jackson to hold the ground

VIEW OF JACKSON'S POSITION AS SEEN FROM GROVETON CORNERS. (FROM A RECENT PHOTOGRAPH.)

The farthest ridge is the line of the unfinished railway. Jackson's center occupied the ground in the right of the picture. There, on elevated open ground, the front of a deep cut, stands the Union monument illustrated on the next page.—EDITOR.

purpose, and certainly for the advance which he subsequently made against our left. Longstreet now asserts that he was in front of Porter with part of his corps at some indefinite hour of the day, variously fixed, but according to him by eleven o'clock in the morning, about the time that Porter's corps reached Dawkins Branch. He further asserts, somewhat extravagantly, that if Porter had attacked he (Longstreet) would have annihilated him. He seems to have thought it a simple matter to annihilate an army corps of ten or twelve thousand men, much of which was composed of regular troops, but perhaps his statement to that effect would hardly be accepted by military men. If such an assertion made by a corps commander of one army is sufficient reason for a corps commander of the opposing army not to attack, even under orders to do so, it is hard to see how any general commanding an army could direct a battle at all; and certainly if such assertions as Longstreet's are considered reliable, there would have been no battle fought in our civil war, since they could easily have been had from either side in advance of any battle that was fought.

It seems pertinent to ask why General

that afternoon, Longstreet himself falling back at least a mile from our front at one o'clock that night after several hours of severe fighting?

I shall not discuss the various statements concerning the time of Longstreet's arrival on the field. That he may have been there in person at the hour he mentions is of course possible; but that his corps was with him, that it was in line of battle at any such hour, or was in any such condition to fight as Porter was, can neither be truthfully asserted nor successfully maintained. Whatever Porter supposed to be Longstreet's position, however, in no respect touches his obligation to move forward under the circumstances and force Longstreet to develop what he really had, which he (Porter) certainly did not know and had taken no measures to know. The severe fighting on his right, which he heard and interpreted into a defeat for the Union army, did not permit him to rest idle on the field with his troops in column and with no sufficient effort even to find out anything of the field in front of him.

If a mere impression that the enemy is in heavy force and that an attack or further advance might be hazardous is a sufficient rea-

son for a corps commander to keep out of a battle, raging in his hearing, especially when he thinks that his friends are being defeated, it is extremely difficult to see how any army commander would venture to engage in battle at all, unless he could ascertain in advance and keep himself acquainted during the day with the impressions of his corps commanders about the propriety of going into the battle at all. Certainly Porter did not know at that time that Longstreet was in his front, and his non-action was based on fancy, and not on any fact that he knew.

But wherever Longstreet was in the morning, it is certain that at four o'clock that day, or about four o'clock, according to his own official report, he withdrew the larger part of his force and advanced to Jackson's right flank to resist the last attack of the Union army on Jackson's line, and that for several hours he was engaged in a severe battle on our left, utterly ignoring Porter and presenting his right flank to Porter's attack during that whole time. He seems also to have entirely forgotten that he was "held in check," as he was good-natured enough to say he was years afterward. During these long hours General Porter still remained idle with his corps in column and many of them lying on the ground, for ease of position probably, as they were not under fire.

Taking the enemy's own account of the battle that afternoon, which lasted several hours, and its result, it is not unreasonable to say that, if General Porter had attacked Longstreet's right with ten or twelve thousand men while the latter was thus engaged, the effect would have been conclusive. Porter's case is the first I have ever known, or that I think is recorded in military history, where the theory has been seriously put forth that the hero of a battle is the man who keeps out of it. With this theory in successful operation, war will be stripped of most of its terrors, and a pitched battle need not be much more dangerous to human life than a militia muster.

When the battle ceased on the 29th of August, we were in possession of the field on our right, and occupied on our left the position held early in the day, and had every right to claim a decided success. What that success might have been, if a corps of twelve thousand men who had not been in battle that day had been thrown against Longstreet's right while engaged in the severe fight that afternoon, I need not indicate. To say that General Porter's non-action during that whole

day was wholly unexpected and disappointing, and that it provoked severe comment on all hands, is to state the facts mildly.

Every indication during the night of the 29th and up to ten o'clock on the morning of the 30th pointed to the retreat of the enemy from our front. Paroled prisoners of our own army, taken on the evening of the 29th, and who came into our lines on the morning of the 30th, reported the enemy retreating during the whole night in the direction of and along the Warrenton pike (since confirmed by Longstreet's report). Generals McDowell and Heintzelman, who reconnoitered the position held by the enemy's left on the evening of the 29th, also confirmed this statement. They reported to me the evacuation of these positions by the enemy, and that there was every indication of their retreat in the direction of Gainesville. On the morning of the 30th, as may be easily believed, our troops,

MONUMENT TO THE UNION SOLDIERS WHO FELL AT GROVETON AUGUST 28, 29 AND 30, 1862. (FROM A PHOTOGRAPH TAKEN SOON AFTER THE MONUMENT WAS ERECTED IN 1865.)

This view was taken from the edge of the railway cut, looking toward the Union lines. The shaft is of brown sandstone, and in design and material is like the monument erected on the Henry hill at the same time. Vandals have removed the shot and shell that were fixed with mortar to the base and to the top of the shaft; every vestige of the inclosing fence has been carried off, and the monument is partly hidden by the four evergreens which were planted at the four corners. In May, 1884, we found a Union canteen on the well-grazed sward near the monument. The field behind the railway cut and behind the embankment, east of the cut, were even then strewn with the tins of cartridge boxes, rusty camp utensils, and bits of accouterments. — EDITOR.

who had been marching and fighting almost continuously for so many days, were greatly exhausted. They had had little to eat for two days, and artillery and cavalry horses had been in harness and under the saddle for ten days, and had been almost out of forage for the

last two days. It may be readily imagined how little these troops, after such severe labors and hardships, were in condition for further active marching and fighting. I had telegraphed General Halleck on the 28th our condition, and had begged of him to have rations and forage sent forward to us from Alexandria with all speed; but about daylight on the 30th I received a note from General Franklin, written by direction of General McClellan, informing me that rations and forage would be loaded into the available wagons and cars at Alexandria as soon as I should send back a cavalry escort to guard the trains. Such a letter, when we were fighting the enemy and Alexandria was full of troops, needs no comment. Our cavalry was well-nigh broken down completely, and certainly we were in no condition to spare troops from the front, nor could they have gone to Alexandria and returned within the time by which we must have had provisions and forage or have fallen back toward supplies; nor am I able to understand of what use cavalry could be to guard railroad trains. It was not until I received this letter that I began to be hopeless of any successful issue to our operations; but I felt it to be my duty, notwithstanding the broken-down condition of the forces under my command, to hold my position. I had received no sort of information of any troops coming forward to reinforce me since the 24th, and did not expect on the morning of the 30th that any assistance would reach me from the direction of Washington, but I determined again to give battle to the enemy and delay as long as possible his further advance toward Washington. I accordingly prepared to renew the engagement.

General Porter, with whose non-action of the day before I was naturally dissatisfied, had been peremptorily ordered that night to report to me in person with his corps, and arrived on the field early in the morning. His corps had been reinforced by Piatt's brigade of Sturgis's division, and was estimated to be about twelve thousand strong; but in some hitherto unexplained manner one brigade of his (Porter's) corps had straggled off from the corps and appeared at Centreville during the day. With this straggling brigade was General Morell, commander of the division to which it belonged.

This brigade remained at Centreville all day, in sight and sound of the battle in which the corps to which it belonged was engaged, but made no move to join it or to approach the field of battle. On the contrary, the brigade commander made requisition for ten thousand pairs of shoes on one of my aides-de-camp who was at Centreville in charge of

the headquarters train. The troops under General Sturgis and General A. Sanders Piatt had followed this brigade by misunderstanding the situation; but the moment they found themselves away from the battle these two officers, with true soldierly spirit, passed Morell and brought their commands to the field and into the battle, where they rendered gallant and distinguished services.

Between twelve and two o'clock during the day I advanced Porter's corps, supported by King's division of McDowell's corps, and supported also on their left by Sigel's corps and Reynolds's division, to attack the enemy along the Warrenton pike. At the same time the corps of Heintzelman and Reno on our right were directed to push forward to the left and front toward the pike and attack the enemy's left flank. For a time Ricketts's division of McDowell's corps was placed in support of this movement. I was obliged to assume the aggressive or to fall back, as from want of provisions I was not able to await an attack from the enemy or the result of any other movement he might make.

Every moment of delay increased the odds against us, and I therefore pushed forward the attack as rapidly as possible. Soon after Porter advanced to attack along the Warrenton pike, and the assault was made by Heintzelman and Reno on the right, it became apparent that the enemy was massing his forces as fast as they arrived on the right of Jackson, and was moving forward to force our left. General McDowell was therefore directed to recall Ricketts's division from our right, and put it so as to strengthen our left thus threatened.

Porter's corps was repulsed after some severe fighting, and began to retire, and the enemy advancing to the assault, our whole line was soon furiously engaged. The main attack of the enemy was made against our left, but was met with stubborn resistance by the divisions of Schenck and Reynolds, and the brigade of Milroy, who were soon reinforced on the left by Ricketts's division. The action was severe for several hours, the enemy bringing up heavy reserves and pouring mass after mass of his troops on our left. He was able also to present at least an equal force all along our line of battle. Porter's corps was halted and re-formed, and as soon as it was in condition it was pushed forward to the support of our left, where it rendered distinguished service, especially the brigade of regulars under Colonel (then Lieutenant-Colonel) Buchanan.

McLean's brigade of Schenck's division, which was posted in observation on our left flank, and in support of Reynolds, became exposed to the attack of the enemy on our left

when Reynolds's division was drawn back to form line to support Porter's corps, then retiring from their attack, and it was fiercely assailed by Hood and Evans, in greatly superior force. This brigade was commanded in person by General Schenck, the division commander, and fought with supreme gallantry and tenacity. The enemy's attack was repulsed several times with severe loss, but he returned again and again to the assault.

It is needless for me to describe the appearance of a man so well known to the country as General R. C. Schenck. I have only to say that a more gallant and devoted soldier never lived, and to his presence and the fearless exposure of his person during these attacks is largely due the protracted resistance made by this brigade. He fell, badly wounded, in the front of his command, and his loss was deeply felt and had a marked effect on the final result in that part of the field.

Tower's brigade of Ricketts's division was pushed forward to his support, and the brigade was led by General Tower in person with conspicuous gallantry. The conduct of these two brigades and their commanders in plain view of our whole left was especially distinguished, and called forth hearty and enthusiastic cheers. Their example was of great service, and seemed to infuse new spirit into the troops that witnessed their intrepid conduct.

I have always considered it a misfortune to the country that General Tower received a severe wound in this action, which disabled him from active service. He is a man of very superior abilities, zealous, and full of spirit and *elan*, and might easily have expected to serve his country in a much higher position than he held on that field.

Reno's corps was withdrawn from our right center late in the afternoon and thrown into action on our left, where the assaults of the enemy were persistent and unintermitting. Notwithstanding the disadvantages under which we labored, our troops held their ground with the utmost firmness and obstinacy. The loss on both sides was heavy. By dark our

left had been forced back half or three-fourths of a mile, but still remained firm and unbroken and still held the Warrenton pike on our rear, while our right was also driven back equally far, but in good order and without confusion. At dark the enemy took possession of the Sudley Springs road, and was in position to threaten our line of communication *via* Stone Bridge. After six o'clock in the evening I learned, accidentally, that Franklin's corps had arrived at a point about four miles east of Centreville, or twelve miles in our rear, and that it was only about eight thousand strong.

The result of the battle of the 30th convinced me that we were no longer able to hold our position so far to the front, and so far away from the absolute necessities of life, suffering, as were men and horses, from fatigue and hunger, and weakened by the heavy losses in battle. About 8 o'clock in the evening, therefore, I sent written orders to the corps commanders to withdraw leisurely to Centreville, and stated to them what route each should pursue and where they should take position at and near Centreville. General Reno, with his corps, was ordered to take post to cover this movement. The withdrawal was made slowly, quietly, and in good order, no attempt whatever being made by the enemy to obstruct our movement. A division of infantry, with its batteries, was posted to cover the crossing of Cub Run.

The exact losses in this battle I am unable to give, as the reports from corps commanders only indicated the aggregate losses since August 22d, but they were very heavy.*

Before leaving the field I sent orders to General Banks, at Bristoe Station, where the railroad was broken, to destroy the cars and such of the stores as he could not take off in the wagon trains, and join me at Centreville. I had previously sent him instructions to bring off from Warrenton Junction and Bristoe Station all of the ammunition and all of the sick and wounded who could bear transportation, throwing personal baggage and prop-

* It is impossible to give with precision the number of men actually present on the field of battle at Groveton and Bull Run, August 29 and 30, 1862. The official returns and reports, on both sides, are not only imperfect, but often contradictory.

A careful study, however, of the subject, based upon the best information obtainable in the War Record's office, justifies the conclusion that the maximum effective strength of the Union army on the field was at least 63,000, and that of the Confederate army about 54,000,—of all arms. This computation of Pope's forces includes his own proper command (exclusive of Banks's corps, which did not reach the scene of action), Reno's corps, and the reinforcements that Pope received from the Army of the Potomac. The records force the conclusion that at least 63,000 were taken into action out of a total present for duty of at least 70,000. The Confederate force has been estimated by some Confederates as low as 47,000. Others concede the number given above.

According to the reports published in Volume XII., Part 2, of the Official Records of the Union and Confederate armies, the losses in the Northern Virginia campaign, from August 16 to September 2, 1862, were approximately as follows:

UNION FORCES.

	Killed.	Wounded.	Captured or Missing.	Total.
Army of Virginia	929	4389	2787	8105
Army of the Potomac	600	3013	1115	4728
Ninth Army Corps.....	204	1000	319	1523
Kanawha Division	14	50	42	106
Aggregate.....	1747	8452	4263	14,462

CONFEDERATE FORCES.

Longstreet's Corps	663	4016	46	4725
Jackson's Corps.....	805	3547	35	4387
Stuart's Cavalry.....	18	83	18	119
Aggregate	1486	7646	99	9231

Unquestionably the numbers given here are too small for each army, but they are the nearest approximation attainable from the official records, in the absence of full returns.—EDITOR.

erty out of the regimental trains, if necessary, for the purpose.

At no time during the 29th, 30th, and 31st of August was the road between Bristoe and Centreville interrupted by the enemy. The orders will show conclusively that every arrangement was made in the minutest detail for the security of our wagon train and supplies; and General Banks's subsequent report to me is positive that none of the wagons or mules were lost. I mention this matter merely to answer the wholly unfounded statements made at the time, and repeated often since, of our loss of wagons, mules, and supplies.

I arrived personally at Centreville about nine or ten o'clock that night. The next morning the various corps were posted in the old intrenchments in and around Centreville, and ammunition trains and some supplies were brought up during the day and distributed. We spent that whole day resting the men and resupplying them with ammunition and provisions as far as our means permitted.

Franklin's corps arrived at Centreville late on the afternoon of the 30th; Sumner's the next day. What was then thought by the Government of our operations up to this time is shown in the subjoined dispatch:

WASHINGTON, August 31, 1862. 11 A. M.

MY DEAR GENERAL:—You have done nobly. Don't yield another inch if you can avoid it. All reserves are being sent forward. . . . I am doing all I can for you and your noble army. God bless you and it. . . .

H. W. HALLECK, General-in-chief.

The enemy's cavalry appeared in front of Cub Run that morning, but made no attempt to attack. Our cavalry, under Buford and Bayard, was completely broken down, and both of these officers reported to me that not five horses to the company could be forced into a trot. No horses whatever had reached us for remounts since the beginning of operations. It was impracticable, therefore, to use the cavalry as cavalry to cover our front with pickets or to make reconnoissances of the enemy's front.

This paper would be incomplete indeed did it fail to contain some short, if entirely insufficient, tribute to that most gallant and loyal soldier, John Buford. I remember very well how surprised I was when I was first placed in command of the Army of Virginia that General Buford, then only a major in the inspector-general's department, reported to me for duty as inspector. I asked him how he could possibly remain in such a position while a great war was going on, and what objections he could have (if he had any) to be placed in a command in the field. He seemed hurt to think I could have even a doubt of his wish

to take the field, and told me that he had tried to get a command, but was without influence enough to accomplish it. I went at once to the Secretary of War and begged him to have Major Buford appointed a brigadier-general of volunteers and ordered to report to me for service. The President was good enough to make the appointment, and certainly a better one was never made. It is hard, in the brief limits of such an article as this, to do justice to such an officer. His coolness, his fine judgment, and his splendid courage were known of all men who had to do with him; but besides, and in addition to these high qualities, he acquired in a few months, through his presence and manner, an influence over men as remarkable as it was useful. His quiet dignity, covering a fiery spirit and a military sagacity as far-reaching as it was accurate, made him in the short period of his active service one of the most respected and trusted officers in the service. His death, brought about by disease contracted during the months of active service and constant exposure, was widely lamented in the army.

I directed General Sumner, on the morning of the first of September, to push forward a reconnoissance toward Little River pike, which enters the Warrenton pike at Fairfax, with two brigades, to ascertain if the enemy was making any movement toward our right by that road. The enemy was found moving again slowly toward the right, heavy columns moving along the Little River pike in the direction of Fairfax. This movement had become so developed by the afternoon of that day, and was so evidently directed to turn our right, that I made the necessary disposition of troops to fight a battle between the Little River pike and the road from Fairfax to Centreville. General Hooker was sent early in the afternoon to Fairfax Court House, and directed to concentrate all the troops in that vicinity and to push forward to Germantown with his advance. I instructed McDowell to move along the road from Centreville toward Fairfax Court House, as far as Difficult Creek, and to connect on his right with Hooker. Reno was directed to push forward north of the road to Centreville, and in the direction of Chantilly, toward the flank of the enemy's advance; Heintzelman's corps to support Reno. Just before sunset the enemy attacked us toward our right, but was met by Hooker, McDowell, and Reno, and by Kearny's division of Heintzelman's corps. A very severe action was fought in the midst of a terrific thunder-storm, and was only ended by the darkness. The enemy was driven back entirely from our front, and did not again renew his attack upon us.

MAJOR-GENERAL PHILIP KEARNY. (FROM A PHOTOGRAPH BY ADDIS, IN THE POSSESSION OF GENERAL J. WAITS DE FEYSTER.)

In this short but severe action the army lost two officers of the highest capacity and distinction, whose death caused general lamentation in the army and country. The first was Major-General Philip Kearny, killed in advance of and while commanding his division. There have been few such officers as Kearny in our own or any other army. In war he was an enthusiast, and he never seemed so much at home and so cheerful and confident as in battle. Tall and lithe in figure, with a most expressive and mobile countenance, and a manner which inspired confidence and zeal in all under his command, no one could fail to admire his chivalric bearing and his supreme courage. He seemed to think that it was his mission to make up the shortcomings of others, and in proportion as these shortcomings were made plain, his exertions and exposure were multiplied. He was a great and most accomplished soldier, and died as he would have himself wished to die, and as became his heroic character, at the head of his troops and in the front of the battle.

General Isaac I. Stevens, who was killed at the same time and nearly on the same ground, was an officer in many respects contrasted to Kearny. He was short and rather stout, with a swarthy complexion and very bright dark eyes. He was a man of very superior abilities and of marked skill and courage. His extreme political opinions before the war, ardently asserted, as was his habit in all matters which interested him, made it somewhat difficult for him to secure such a position in the army as one of his capacity might well have expected. The prejudice against him on this account was soon shown to be utterly groundless, for a more zealous and faithful officer never lived. His conduct in the battle

in which he lost his life, and in every other operation of the campaign, was marked by high intelligence and the coolest courage, and his death in the front of battle ended too soon a career which would have placed him among the foremost officers of the war. As an officer of engineers before the war, and as Governor of, and delegate to Congress from, Washington Territory, he was always a man of note, and possessed the abilities and the force to have commanded in time any position to which he might have aspired. The loss of these two officers was a heavy blow to the army, not so much perhaps because of their soldierly capacity as because of their well-known and unshakable fidelity to duty, and their entire loyalty to their comrades in arm.

On the morning of the 2d of September the army was posted behind Difficult Creek from Flint Hill to the Alexandria pike. The enemy disappeared from our front, moving toward the Upper Potomac with no attempt to force our position. And here the second battle of Bull Run may be said to terminate. On that day I received orders from General Halleck to take position in the intrenchments in front of Washington, with a view to reorganizing the army and eliminating such of the discordant elements in it as had largely caused the misfortunes of the latter part of that campaign.

The transactions at Alexandria and Washington City during these eventful days, as also at Centreville during part of them, are as closely connected with these battles, and had nearly as much to do with their results, as any part of the operations in the field; but they

MAJOR-GENERAL ISAAC I. STEVENS. (FROM A PHOTOGRAPH.)

demand more space than is accorded to a magazine article. The materials to write a complete account of these matters are at hand, and it is quite probable that the course of events may yet make their publication necessary.

There are other matters which, although not important, seem not out of place in this paper. A good deal of cheap wit has been expended upon a fanciful story that I published an order or wrote a letter or made a remark that my "headquarters would be in the saddle." It is an expression harmless and innocent enough, but it is even stated that it furnished General Lee with a basis for the only joke of his life. It is painful, therefore, to a well-constituted mind to be obliged to take away the foundation of that solitary joke; but I think it due to army tradition, and to the comfort of those who have so often repeated this ancient joke in the days long before the civil war, that these later wits should not be allowed with impunity to poach on this well-titled manor. This venerable joke I first heard when a cadet at West Point, and it was then told of that gallant soldier and gentleman, General W. J. Worth. I presume it could be easily traced back to the Crusades and beyond; and while it may not be as old as the everlasting hills, it is certainly old enough to have been excused from active duty long years ago. Certainly I never used this expression or wrote or dictated it, nor does any such expression occur in any order of mine; and as it has perhaps served its time and effected its purpose, it ought to be retired. Let us hope that it may be permitted to sleep in peace and no longer rack the brain of those whose intellectual machinery can ill bear the strain, or be perpetuated among their natural successors.

I thus conclude for the present this account of the second battle of Bull Run. The battle treated of, as well as the campaign which preceded it, have been, and no doubt still are, greatly misunderstood. Probably they will remain during this generation a matter of controversy, into which personal feeling and

prejudice so largely enter that dispassionate judgment cannot now be looked for.

I submit this article to the public judgment with all confidence that it will be fairly considered, and as just a judgment passed upon it as is possible at this time. I well understood, as does every military man, how difficult and how thankless was the task imposed on me, and I do not hesitate to say that I would gladly have avoided it if I could have done so consistently with duty.

To confront with a small army greatly superior forces, to fight battles without the hope of victory, but only to gain time by delaying the forward movement of the enemy, is a duty the most hazardous and the most difficult that can be imposed on any general or any army. While such operations require the highest courage and endurance on the part of the troops, they are unlikely to be understood or appreciated, and the results, however successful in view of the object aimed at, have little in them to attract public commendation or applause.

At no time could I have hoped to fight a successful battle with the superior forces of the enemy which confronted me, and which were able at any time to outflank and bear my small army to the dust. It was only by constant movement, incessant watchfulness, and hazardous skirmishes and battles, that the forces under my command were saved from destruction, and that the enemy was embarrassed and delayed in his advance until the army of General McClellan was at length assembled for the defense of Washington.

I did hope that in the course of these operations the enemy might commit some imprudence, or leave some opening of which I could take such advantage as to gain at least a partial success. This opportunity was presented by the advance of Jackson on Manassas Junction; but although the best dispositions possible in my view were made, the object was frustrated by causes which could not have been foreseen, and which perhaps are not yet completely known to the country.

John Pope.

THE NEW HENRY HOUSE AND THE MONUMENT OF THE FIRST BATTLE.

RECOLLECTIONS OF A PRIVATE.—VI.*

TWO DAYS OF THE SECOND BATTLE OF BULL RUN.†

COUNTING THE SCARS IN THE COLORS.

POPE'S first orders on the 29th of August were partly given with a view to the possibility of falling back beyond Bull Run. At three o'clock of that morning Pope had written to Porter that McDowell had intercepted the retreat of Jackson; that Kearny and Hooker were to attack the enemy's rear; and that Porter was to move upon Centreville at dawn of day. Porter was obeying the order when he learned its revocation through a staff-officer riding with orders to another part of the field, and at once countermarched from Manassas Junction. Meanwhile Pope had learned that Ricketts's and King's divisions had retreated, leaving open the road for Lee's advance or Jackson's retreat. He ordered Sigel to attack in order to bring Jackson to a stand if possible. Jackson was in fact leisurely awaiting attack behind his chosen stronghold of the unfinished railroad, with his skirmishers in front for the most part veiled with thick woods. General Sigel soon developed the position of the enemy. There were gaps in Sigel's lines, the closing of which weakened the main line, itself already too thin for such an attempt. The enemy were quick to avail themselves of this weakness, and broke our lines by a furious attack, causing Sigel to fall back.

Longstreet had availed himself of the roads left open by King and Ricketts, and about noon his advance had formed on Jackson's right. After 12 o'clock McDowell brought to Porter information from General Buford, show-

ing that Longstreet was holding the roads in force in Porter's front, and hence it was impossible, by marching on converging lines, to establish communications with the right wing of the army without giving battle. After consultation with Porter, McDowell started with King's division to go round by the Sudley Springs road. Porter waited to open up communications with McDowell, sending scouting parties through the broken country and tangled woods to the right for this purpose.

Towards noon a part of Sigel's force, under Schurz, gained a foothold on the railroad, and held on stubbornly for two hours. They were exhausted with marching, fighting, and manœuvring in the extreme heat since five in the morning.

The veterans of Heintzelman, under Kearny and Hooker, aroused from their bivouacs at two in the morning, were an hour after sunrise on the heights of Centreville, in sight of the blue hills about Thoroughfare Gap through which Longstreet was hastening to Jackson's aid. Fording Bull Run, they came upon the rusty remains of guns, bayonets, weather-beaten fragments of gun-carriages and equipments, and the bleaching skulls and bones of their comrades who had perished on the field the year before—the first sacrifices to the blunders of the war. Many fields were black from the effect of fires ignited by our shells. This fragment of the army, under Hooker and Kearny, was in a destitute condition. The horses of the field-officers in most instances had been

RUINS OF THE HENRY HOUSE. (FROM A PHOTOGRAPH TAKEN SHORTLY BEFORE THE SECOND BATTLE.)

† The writer is indebted to friends of the 11th and 18th Mass. Volunteers and to comrades of other organizations for the incidents relating to this battle.—W. L. G.

COLLECTING THE WOUNDED.

"What does the General want me to do?" Grover inquired of the officer bringing the order.

"Go into the woods and charge."

"Where are my supports?"

"They are coming," was the reply.

Drawing his men up in line, he awaited the arrival of his supports, which did not come. But receiving imperative orders to "Charge at once," the men loaded their rifles and fixed bayonets. With cheers the men dashed through the tangled wood in their front. One of the regiments had its flag torn from its staff, and the eagle was shot away from its top, but the men answered to the cry, "Rally round the pole." As they stormed the railroad they saw wounded Confederates clutch the embankment, hold on for a moment, and then losing their grasp, roll down the steep bank. The first line of the enemy was overthrown. On they rushed upon a second line. Bayonets and swords were used at close quarters, so stubborn was the fight.

Had this attack been properly supported, it must have broken Jackson's center. There were many deeds performed in this action

left behind at Yorktown. The rank and file were poorly supplied with clothing, and to a large extent destitute of proper rations. Many were without blanket or blouse, some even without trousers; others with shoeless, blistered feet were marching over rough, hot, and dusty roads. Still they were full of enthusiasm for the fight; and as Pope, with a numerous staff, passed them on the road, he was loudly cheered. After that battle there was less cheering for the commander. At eleven o'clock they had reached the battle-field. At three Pope ordered Hooker to attack the strong position in his front. General Hooker, foreseeing that the attack promised but little chance of success, remonstrated.

Finally the order came to General Grover.
